Washington state population forecast by age and sex: 2020-50

Background

Each November, the Office of Financial Management (OFM) produces a forecast of the state population for 30 years from the latest decennial census. These forecasts by sex and single year of age incorporate assumptions about how fertility, mortality, and migration will change in the future. We update these assumptions each year to reflect recent trends, and then reconstruct the forecast to start from the latest April 1 estimates.

Overall population change

We expect Washington's population to continue growing from 7.7 million in 2020 to almost 9.9 million in 2050 (a 28% increase), for an annual average growth rate of 0.8%.

Population changes in three ways: births, deaths, and migration. *Natural change* is the number of births minus the number of deaths. *Net migration* is the number of people moving into Washington minus the number of people moving out of the state. Figure 1 shows the increasing importance of net migration as a driver of population growth (see Table 1 for additional detail). Between 2020 and 2050, we expect Washington to add about 2,160,800 people, reaching 9,867,100 in 2050. Approximately 84% (1,819,000 people) of the increase is due to net migration, with the other 16% (341,800 people) due to natural change.

Natural change is expected to decline from 26,300 in 2020 to just under 5,100 in 2050. Births are forecast to increase over time as the population grows, but the rise in deaths as the Baby Boomer generation ages will temper natural change. This population aging explains the increasing role of net migration in population growth for the coming decades.

Figure 1: Components of population change by decade, 1970–50

Table 1. Components of population change 2010-50

Time Period	April 1 Population at End of Period	Population Change	Percentage Population Change	Number of Births	Birth Rate	Number of Deaths	Death Rate	Natural Change	Net Migration	Net Migration Rate

Notes: 1. Unrounded data should not be considered accurate to the last digit. 2. Rates computed per 1,000 population at yearly midpoint.

Age-specific population change

The change in Washington’s total population is only part of the story since many impacts we associate with population change are age group specific, such as effects on healthcare, labor force, and education. The population will get older over the forecast window as the large Baby Boomer generation ages and births decline. This means the median age will increase from 38.1 years in 2020 to 43.8 in 2050. Based on the projection, this section highlights changes in the school-age, labor force, senior, and most elderly populations.

School-age population (ages 5 to 17)

This age group represents, approximately, the population potentially enrolling in school from kindergarten through 12th grade. This group numbers 1,243,000 in 2020 and will add 119,900 people to reach a total of 1,393,000 in 2050. While recent growth has been strong – averaging 6,100 people per year from 2020 to 2024 – this cohort will likely shrink for 9 years after 2024, reflecting lower birth rates since 2018. In 2034, this population will return to a pattern of growth for the remainder of the forecast.

Figure 2. School-age population and annual change, 1990-2050

College-age population (ages 17 to 22)

A key indicator of labor force change is the college-age population, including most students in postsecondary institutions *and* young workers entering the labor force. The population aged 17 to 22 grows by almost 52,000 from 2020 to 2050, from 582,100 to 634,100. The next decade sees the fastest growth, adding 5,900 people per year from 2020-2030. Declines in this population from 2032 through 2043, again, reflect recent low birth rates.

Figure 3. College-age population and annual change, 1990-2050

Senior population (ages 65 and over)

The aging of Washington's population is clearly reflected in the dramatic increase of the 65 and older population over the next 30 years. The rapid growth of this older population carries important planning and policy implications at the state and local levels. In 2020, there are 1,252,300 people over age 65 or about 16% of the total population. By 2050, we expect the senior population to nearly double, reaching 2,286,000 people and 23% of the population. The fastest growth is expected to occur before 2030 as the Baby Boomer generation enters the age bracket. For reference, the 2011 spike in the 65 and over population corresponds to the spike in births in 1946 (exactly one year after American service members returned from World War II).

Figure 4. Senior population and annual change, 1990-2050

Most elderly population (ages 85 and over)

The most rapid shift will come at the oldest end of the age distribution, those age 85 and over. This population is expected to increase by more than 4 times from 2020 to 2050, growing from 131,000 in 2020 to 529,000 in 2050. Growth in this group has important fiscal and capacity planning implications for long-term care. In the first half of the forecast, 2020 to 2035, the population will grow by an average of 8,700 people per year. We expect this rate to double in the second half of the forecast, however, adding 16,900 people per year between 2035 and 2050.

Figure 5. Most elderly population and annual change, 1990-2050

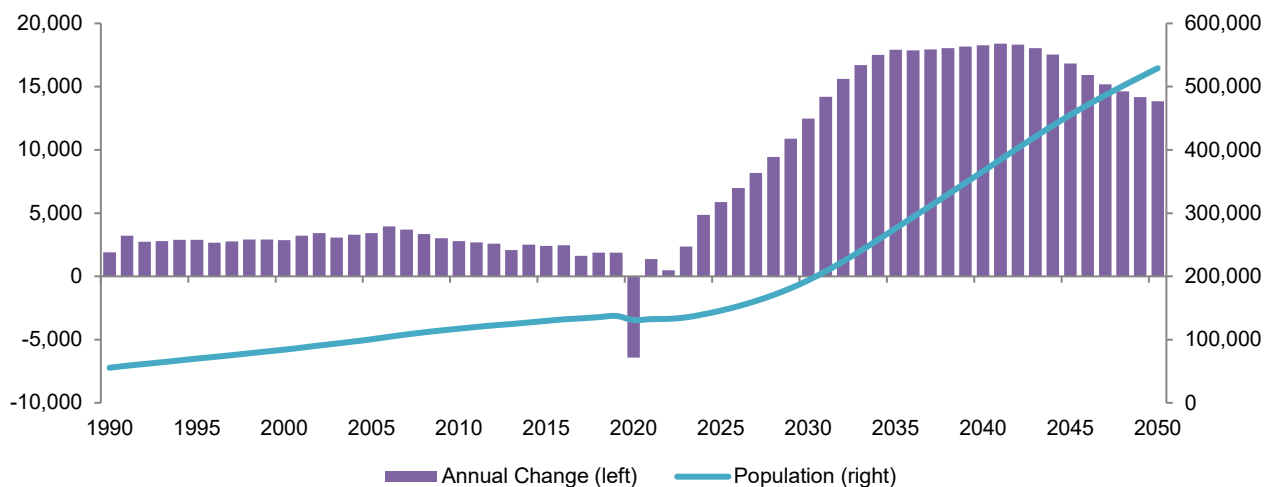

Table 2. Population by specific age groups 2000-50

Year	School Age (5-17)	College Age (17-22)	Labor Force (18-64)	Senior (65+)	Very Elderly (85+)

Forecast model and assumptions

To produce the state forecast, we construct a model based on the population balancing equation: that the population this year is equal to the population last year plus births, minus deaths, plus net migration. Our model is a cohort-component model because it also accounts for the age and sex structure of the population. Specifically, the model *starts* with 2020 population by single year of age and sex, *ages* each group one year older while subtracting mortality, *applies* fertility rates to generate new births, and *adds* migration to generate the population for 2021. The model repeats this process for each year until the forecast horizon in 2050. Estimated and actual values replace forecasted values for 2020-23.

This November forecast also updates the assumptions we have about long-term fertility rates, survival rates, and short-term migration values, while also adding new 2020 base year data by age and sex. We expect this to be the last base data update for the decade since the Census Bureau, after a delay, finalized the needed 2020 Census data.

Fertility assumptions

The total fertility rate, or the average number of children born to a woman who experiences all childbearing years, is at a historic low following decades of decline. This decline is consistent with national trends and with trends in western European countries. We rely on the United Nations' 2022 projections for the U.S. and other countries to construct our 2050 total fertility rate forecast of 1.72 children per woman in Washington, a slight increase from the current TFR of 1.56 (United Nations, Department of Economic and Social Affairs, Population Division 2022). This forecasted increase is not only in line with the UN projections, but also agrees with U.S. Census Bureau projections (U.S. Census Bureau 2023). There are several substantive reasons to believe fertility rates will recover slightly from their current lows. First, fertility rates fell during the COVID-19 pandemic, dramatically impacting economic and social life in the nation. In response to these shocks, women may be delaying their childbearing rather than foregoing childbearing altogether. Such delays are consistent with the previously observed dramatic declines in fertility rates for 15-to-19-year-old women, while fertility rates for women over 30 have increased. Our forecast assumes fertility rates will recover somewhat, but it is too early to tell what the long-term consequences of these shocks will be for fertility rates in the future.

The decline in fertility rates has led to lower numbers of births since 2017. Approximately 83,200 babies were born in Washington last year, about 1,200 lower than 2022, but still higher than the 2021 low. As the population grows, largely through in-migration of working-aged people (ages 16 to 64), the number of births will increase to 91,800 in 2035 and 99,400 in 2050 despite lower rates. As migration's importance for population growth increases, the fertility behavior of those migrants will shape how birth rates change in the future as well.

Mortality assumptions

Life expectancy at birth measures the average number of years a person born in a period would live, assuming mortality rates stay the same. This is the metric that the state forecast model uses to project the level of mortality in the population.

Washington's life expectancy has historically been higher than the U.S., a trend we project into the future. We apply this shift to UN projections of U.S. life expectancy by sex to construct Washington life expectancy through 2050. Female life expectancy will increase more slowly than male life expectancy. However, it will remain higher throughout the forecast, reaching 87 years in 2050 compared to 83.9 for men. We've changed our approach to COVID-19 deaths as the pandemic's impact on deaths has waned and mostly been incorporated into the estimate years 2020-23. Instead of predicting a quick return to pre-pandemic mortality patterns, we're predicting that we'll see more slowly increasing life expectancy to lower 2050 values than we used in the previous forecast.

As with fertility, in the coming decades we'll see large increases in the number of deaths. This is true despite increasing life expectancy as Washington's population continues to age into higher mortality groups. The crude death rate (deaths per 1,000 people) will increase from 7.7 in 2020, to 9.2 in 2035, and finally to 9.6 in 2050.

Net migration assumptions

Net migration is the primary driver of forecasted population change as natural change slowly decreases. Migration is also the hardest to predict because it can change far more quickly than births or deaths. Typically, migration follows cyclical economic indicators such as employment. However, it can also change due to non-economic factors such as military

installation changes or refugee resettlement. In the near-term, the forecast uses an econometric model that weighs changes in employment in Washington against California and the rest of the nation. In the long term, migration is set to an adjusted 30-year average to provide a reasonable estimate despite significant uncertainty. The near-term forecast is smoothly transitioned to hit the long term forecast by 2041.

Figure 6. Comparison of forecast net migration with historical estimates, 1990-2050

Figure 6 shows historical and predicted net migration from 1990 to 2050 and includes a comparison of this year’s forecast to last year’s. In 2023, the estimated net migration is 72,400, which is about 2,700 higher than the forecast from last year. We did not change our long-term migration assumption of 61,300 and we hold it constant after hitting that value in 2041. This long-term migration assumption is higher than last decade’s as the updated 30-year average excludes low migration in the 1980s and includes recent higher migration. For the near-term period of 2025-2030, the forecast is 10,300 people higher than the previous forecast.

Annual population estimates and forecasts by age and sex, 2020-50

The following tables show the annual population estimates and forecasts by age and sex for the years 2020-50. Figures for 2020-2023 are OFM's postcensal estimates, figures for 2024-50 are forecasts.
