

Tables to Roll to Biennium 2025 by Phase

The table roll is the process by which certain current biennium AFRS tables, both statewide and agency, are automatically copied into the new biennium (2023-25), thereby eliminating the need to rekey the majority of tables. The table roll process will happen in four phases and the specific tables that will roll in each phase are identified in the schedules below. There are also schedules showing (a) tables that have their own unique roll schedule, (b) tables that do not roll and must be entered by the agency, and (c) tables that do not roll because they are not associated with a specific biennium or are not currently used.

Phase 1 – OI and DT / Simulated on April 10 and Actual Roll on April 22

AFRS Automated Table Upload Process

Certain AFRS tables can be added, changed, and deleted by agencies through an automated table upload process. This process uses templates accessed through the ER Web Intelligence application to download current records to Excel; user updates/adds records as necessary in Excel; and user uploads as text file into AFRS. Please refer to the “**AFRS Automated Table Upload Process**” document on the [AFRS Documentation](#) webpage for detailed instructions.

The automated table upload process is recommended to add BI 25 Master Index records as these do not roll in the AFRS table roll process. It is also recommended for agencies that are changing their coding structure. For example, an agency changing their organization index (OI) structure could opt out of the AFRS table roll for the OI and use the AFRS Automated Table Upload process to add their OI and related descriptor table records.
