#### Proposal content

- ☑ Project Proposal Checklist: this form; one for each proposal
- ☑ Project Proposal Form: Specific to category/subcategory (10-page limit)
- Appendices: templates, forms, exhibits and supporting/supplemental documentation for scoring.

#### Institutional priority

☑ Institutional Priority Form. Sent separately (not in this packet).

Check the corresponding boxes below if the proposed project meets the minimum threshold or if the item listed is provided in the proposal submittal.

#### Mi

ini	mum thresholds
$\boxtimes$	Project is not an exclusive enterprise function such as a bookstore, dormitory, or contract food service.
$\boxtimes$	Project meets LEED Silver Standard requirements.
$\boxtimes$	Institution has a greenhouse gas emissions reduction policy in place in accordance with RCW 70A.45.050 and vehicle emissions reduction policy in place per RCW 47.01.440 or RCW 43.160.020 as applicable.
$\boxtimes$	A complete predesign Feasibility Study was submitted to OFM by July 1, 2022 and approved.
	Growth proposals: Based on solid enrollment projections and is more cost-effectively providing enrollment access than alternatives such as university centers and distance learning.
	Renovation proposals: Project should cost between $60-80\%$ of current replacement value and extend the useful life of the facility by at least 25 years.
	Acquisition proposals: Land acquisition is not related to a current facility funding request.
$\boxtimes$	Infrastructure proposals: Project is not a facility repair project.
	Stand-alone, infrastructure and acquisition proposals is a single project requesting funds for one biennium.

Office of Financial Management June 2022

2022 Higher Education Project Proposal Form

INSTITUTION	CAMPUS
Western Washington University	Bellingham
PROJECT TITLE	
Heating Conversion Project – Phase 1	

#### **Summary narrative**

#### • Problem statement

Western Washington University (Western) relies on an over 75-year-old gas-fired central steam plant and distribution system to heat most of its facilities. The plant accounts for approximately 97% of Western's greenhouse gas (GHG) emissions. This is exacerbated by the fact that approximately 30% of all heat generated by the Steam Plant is unavoidably lost in distribution.

The current plant uses antiquated systems to run the boilers. These systems require substantial upkeep and frequent replacement of parts. Finding replacement parts and technicians to perform repairs has become increasingly difficult as these systems continue to age and become obsolete. If Western is unable to maintain and fix these systems, the Steam Plant will be at risk of shutting down, thus shutting down University operations.

The Steam Plant requires, per State law, an operator to be on-site 24 hours a day. Western has experienced increasing difficulty recruiting operators qualified to run steam plants. For example, Western began recruitment for a Steam Plant Operator position in October 2021 that remains unfilled. As a result, Western has fewer operators than ideal for the plant, posing staffing challenges and increasing the risk of system interruption and undermining routine maintenance.

Additionally, the system is fueled by natural gas which has become increasingly volatile in price. This trend is going to continue as the Climate Commitment Act and legislation associated with the cap and invest carbon markets become effective.

Most campus buildings lack cooling, which creates significant operational challenges on increasingly frequent peak heat days. Excessively warm classrooms and labs make teaching and learning difficult, and students must adjust lab procedures because high temperatures can corrupt results. Performances in assembly spaces must either be cancelled due to excessive heat or supported with rented chillers. The campus also experiences heat related equipment failures. In addition to the challenges posed by high temperatures, wildfire smoke can make air quality bad enough to preclude the use of natural ventilation.

#### • Project Description

The Heating Conversion Project – Phase 1 will provide several independent plants (Nodal Option), each serving a different portion of the campus, that use a combination of heat pumps, heat recovery chillers, and air-cooled chillers to provide heating and chilled water. Natural gas boilers are included in the nodal plants to achieve the high temperature water required by older buildings on peak heating days as well as provide

added resiliency.

The project also includes a four-pipe distribution system with supply and return piping for both heating and/or chilled water that is delivered to energy transfer stations serving the academic buildings on campus. A geo-exchange field will also be paired with each of the nodal plants to efficiently store thermal energy. The project does not include retrofitting each building. The retrofits within the buildings will be completed under Heating Conversion Project - Phase 2 or during major building renovations that are funded with separate appropriations. The retrofits are not necessary to decommission the Steam Plant and use the new infrastructure but will be needed to maximize the value of the new plants and further reduce Western's overall GHGs.

This project will require multi-biennia to complete. Western is requesting \$10 million in the 2023 – 2025 capital budget for schematic design, scope detail, testing (ground surveys, soil boring, preliminary distribution engineering, detailed load analysis), drawings and specifications, phased implementation scenarios, detailed financial analysis, and completion of full design of the first nodal plant and associated distribution system. The location of the first nodal plant and distribution system will be determined during the planning stage but will likely be in north or south academic zones. Western plans to submit funding requests in the four subsequent biennia in the estimated amount of approximately \$35 million per biennium for the remainder of design and construction of the project. Funding for the Heating Conversion Project – Phase 2 will be requested after the first nodal plant and associated infrastructure is complete.

#### • History of the project

The 2021-23 Capital Budget included a \$450,000 grant from the Department of Commerce to explore the feasibility of converting our central steam to a more sustainable approach to heating our facilities. The study was completed in July 2022 and analyzed the economic and engineering requirements of such a conversion. Feasible low carbon options for new central plant configurations were developed and their relative advantages identified. Energy and carbon savings and other operational costs were estimated and balanced against the initial costs of construction using a total cost of ownership (life cycle cost) model. The financial analysis also considered the increasing need for major renewal and replacement of the steam system over the coming years, as well as the eventual renewal and modernization of heating and cooling systems in all buildings. Based on the financial and technical analyses completed, a Nodal Option was identified as the preferred alternative.

Per the study, the Nodal Option is one of the better options from a carbon reduction standpoint with the complementary use of heat pumps and the geo-exchange. The Nodal Option also provides more implementation flexibility. Each node can be implemented independently of the others, providing more manageable projects that may better match the availability of funds. Overall campus disruption during construction is also limited at any one time to the area of campus served by the node and distribution piping being installed. A link to the study is included in the Appendix below.

#### • University programs addressed or encompassed by the project

This project will provide the necessary infrastructure to heat and cool the majority of Western's facilities in a sustainable and efficient manner. All academic facilities on Western's Bellingham campus will benefit from this project, especially with the ability to efficiently heat and cool teaching spaces, including research and instructional labs. Additionally, this project, particularly the SD phase, will become a case study for the Institute for Energy Studies.

#### General category scoring criteria

#### 1. Significant health, safety, and code issues

- **A.** This project will reduce Western's greenhouse gas (GHG) emissions by approximately 50% and has the potential to reduce GHG by 90% once all the buildings are fully retrofitted. This meets State and National goals of reducing carbon emissions and Western's impact to climate change.
- **B.** By replacing the existing Steam Plant, this project will transition to an inherently safer lower pressure and lower temperature water distribution system. Additionally, the pipe insulation at the Plant and in the distribution system has asbestos. While Western is containing the asbestos per code, employees maintaining the Steam Plant and associated network still have potential for exposure. Thus, it is best to eliminate the asbestos completely.

#### 2. Evidence of increased repairs and/or service interruption

To maintain the entire steam system, an annual two-week shutdown is required for preventative maintenance. This shutdown occurs during intersession when the campus population is at its lowest; however, backup heating systems are still required for critical needs such as cooking facilities, year-round residence hall domestic hot water, and research in the vivarium. The other important preventative task is steam traps in the system need annual inspection, costing approximately \$15,000 per year to ensure heat loss into the condensate return system is minimized. Within the Steam Plant proper, the boiler feedwater pumps require regular rebuilding, and the numerous fans and other motors need regular inspection and lubrication. This year, two large deaerator tanks are due for inspection and repair if any cracked welds are discovered.

The campus wide distribution system encompassing both steam supply and condensate return is at the end of its expected life. Condensate return pipes are prone to corrosion, and two major buildings have had their underground return pipes break, forcing condensate water and its energy content to be dumped down the sewer and creating a make-up water need at the central plant. Most of the distribution network travels through tunnels and trenches. These are beginning to crack, allowing ground water infiltration that causes flooding and requiring mitigations to channel the water away.

The steam supply piping is subject to expansion and contraction movement of several inches throughout the system. Specialized expansion joints are required to allow the movement but still hold pressure. These are also at the end of their useful life and beginning to leak, causing isolated system shutdowns for repairs.

See Appendix A for service repair history and Appendix B for commodity use and cost history.

#### 3. Impact on institutional operations without the infrastructure project

The existing steam system is a mid-20th century design that is beyond its planned service life; its condition is deteriorating, and it requires substantial upkeep. Beyond the physical condition of the plant, operators and vendors qualified to operate and repair the systems are increasingly difficult to

locate. These circumstances put all campus-wide operations at risk as all functions are dependent on reliable heat.

Additionally, this project is proposing to add cooling to reduce our operational challenges on increasingly frequent peak hot days. Without cooling, the following are some of the challenges the campus will continue to experience:

- Excessively warm classrooms and labs, making teaching and learning difficult
- Research efforts, which are often scheduled during summer months due to lab availability, are impeded by high temperatures
- Performances in assembly spaces are either canceled due to excessive heat or supported with costly and inefficient rented chillers
- Heat related equipment failures, particularly in the data communications system
- Increased ineffectiveness of historical "free cooling" strategies due to wildfire smoke and increased summertime instruction on campus

The ten-year capital plan includes renovation of three prominent academic facilities. Without funding to proceed to schematic design, those renovations will need to consider alternative heating and cooling systems, including connection to the antiquated steam plant.

#### 4. Reasonable estimate

The feasibility study included a detailed cost estimate (see link below). The estimate was based on industry standards, market conditions, the size and complexity of the project, and the size and complexity of Western's campus. The cost estimate for the Heating Conversion Project – Phase 1, per the study, is currently estimated to be \$149 million. This includes the plants, distribution system, geothermal fields, and replacement of heat exchangers. However, this excludes the retrofits within the buildings to optimize the heating and cooling created from the new infrastructure. This scope of work is envisioned to be done in phases and, when complete, will eliminate the need for the Steam Plant and aging distribution system. This would also reduce Western's total GHG emissions by approximately 50%. However, the project's goal of reducing Western's GHG emissions by 90% would not be realized until all the retrofits within the buildings are completed (Phase 2). This is because heavier usage of the backup natural gas boilers in each plant would be required on the colder winter days until those retrofits are complete.

Per the study, the retrofits within the buildings are estimated to cost \$314 million. These improvements will be implemented under the Heating Conversion Project - Phase 2 project or during major building renovations that are funded with separate appropriations. These improvements will be completed after the new plants are operational.

The scope of work planned in 2023-25 includes further refinement of the cost estimates as well as optimizing the phasing of each nodal plant and the buildings. The results of the Schematic Design phase will also inform Western which buildings are in most urgent need for conversion.

#### 5. Engineering study

The feasibility study analyzed the economic and engineering requirements of converting our Steam Plant to a water-based heating and cooling system. The study analyzed several alternatives and did a comprehensive analysis of four most viable options, as well as business as usual, and made a

recommendation of the Nodal Option based on those results. The results of the study can be found in the link below.

The next phase, partial design, will provide scope detail, testing (ground surveys, soil boring, preliminary distribution engineering, detailed load analysis), drawings and specifications, phased implementation scenarios, and detailed financial analysis, as well as full design of one of the nodal plants.

#### 6. Support by planning

#### A. Campus/facilities master plan

The 2017 Utilities Master Plan identified the liabilities of the existing steam heating system and recommended reviewing alternative low temperature, high efficiency heating. Additionally, the plan identifies the lack of cooling on campus as a challenge to our operations. This project is following the recommended next steps of the Utility Master Plan and the Heating Conversion Feasibility Study. A link to the Utilities Master Plan is in the Appendix below.

Western's Sustainability Action Plan calls for carbon neutrality. This project is necessary step in achieving this goal. A link to the Sustainability Action Plan is listed below.

#### B. Ongoing academic and/or research program need and strategic plan

Western is considering offering summer courses to reduce time to degree and offer flexibility to students. Additionally, student-faculty participatory research will also be increased during the summer months to provide additional learning opportunities. The cooling component of this project will assist in allowing this course work to occur without compromise or interruption.

#### 7. Resource efficiency and sustainability

Steam district heating systems have built-in inefficiencies because the distribution network needs to be kept at constant pressure and temperature to work effectively. Even in summer when demand drops off to a small percentage of the winter peak, the distribution must be kept at the same temperature. The required high temperature (340F) and pressure (100 psi) is sustained by a natural gas combustion process that has an annual maximum efficiency of only 56%, which means a significant portion of the heat generated is lost in transmission. This process accounts for 97% of the GHG emitted on Western's main campus.

The proposed system utilizes relatively low (140F) water distribution temperatures. These are achieved by concentrating ambient energy from the air and ground sources with heat pumps that deliver four units of heat for each unit of electrical energy delivered to the heat pump (a 400% efficiency). This reduces the fossil fuel dependency to only the very coldest days of the year or when emergency backup is needed during a rare power outage. The GHGs are reduced by nearly 90%, once all the buildings are retrofitted, since the primary external energy for heating switches to renewably generated electricity from Western's "Green Direct" power purchase agreement with Puget Sound Energy.

# Appendix D

energy usage through enhanced production efficiency, reduction in losses, and ability to recover sources of waste heat that would be lost in a distributed generation system. This consolidation also reduces costs associated with renewal and maintenance due to fewer pieces of equipment required as opposed to a distributed system. It also provides the ability to incorporate and transition to renewable sources as they become economically and technically viable in an effective and efficiency manner.

#### 5.1.1. Heating Production Plant Overview

The existing Steam Production Plant was originally constructed in 1946 and is centrally located on the east side of the campus next to the Arboretum Forest. The building is two story and covers 11,000 sq. ft. In 1969 a major building expansion added space for boilers #5, #6, and a chilled water plant with an outdoor cooling tower. The chilled water equipment has since been removed and the space is used for the facility repair shop and district compressed air system. District compressed air is distributed to various buildings throughout campus for controls and process usage.

#### **Existing Plant Equipment**

The Steam Production Plant produces steam utilizing five water tube boilers of various sizes. The total installed steam capacity is 260,000 lb/hr. Each boiler has a single stage economizer that utilizes waste heat from the stack exhaust gas to preheat boiler feed water.

**Steam Production Plant – Installed Capacity** 

	Year	Nominal	
Name	Installed	Output (lb/hr)	Fuel Type
Boiler #2	1946	15,000	N. Gas/Oil
Boiler#3	1959	25,000	N. Gas/Oil
Boiler #4	1966	40,000	N. Gas/Oil
Boiler #5	1970	100,000	N. Gas/Oil
Boiler #6	1995	75,000	N. Gas
