NOTE: Multiple symbols are used to indicate borderline or dual soil classifications

### Sampler Symbol Descriptions

|  |                                 |
|--|---------------------------------|
|  | 2.4-inch I.D. split barrel      |
|  | Standard Penetration Test (SPT) |
|  | Shelby tube                     |
|  | Piston                          |
|  | Direct-Push                     |
|  | Bulk or grab                    |
|  | Continuous Coring               |

Blowcount is recorded for driven samplers as the number of blows required to advance sampler 12 inches (or distance noted). See exploration log for hammer weight and drop.

A "P" indicates sampler pushed using the weight of the drill rig.

## ADDITIONAL MATERIAL SYMBOLS

| SYMBOLS |           | TYPICAL DESCRIPTIONS        |
|---------|-----------|-----------------------------|
| GRAPH   | LETTER    |                             |
|         | <b>AC</b> | Asphalt Concrete            |
|         | <b>CC</b> | Cement Concrete             |
|         | <b>CR</b> | Crushed Rock/ Quarry Spalls |
|         | <b>TS</b> | Topsoil/ Forest Duff/Sod    |

### Groundwater Contact

Measured groundwater level in exploration, well, or piezometer

Measured free product in well or piezometer

### Graphic Log Contact

Distinct contact between soil strata or geologic units

Approximate location of soil strata change within a geologic soil unit

### Material Description Contact

Distinct contact between soil strata or geologic units

Approximate location of soil strata change within a geologic soil unit

### Laboratory / Field Tests

### Sheen Classification

|    |                  |
|----|------------------|
| NS | No Visible Sheen |
| SS | Slight Sheen     |
| MS | Moderate Sheen   |
| HS | Heavy Sheen      |
| NT | Not Tested       |

NOTE: The reader must refer to the discussion in the report text and the logs of explorations for a proper understanding of subsurface conditions. Descriptions on the logs apply only at the specific exploration locations and at the time the explorations were made; they are not warranted to be representative of subsurface conditions at other locations or times.

# Hydraulic Modeling - Theis Analysis Results for Case Study 1

Case Study 1

Q = 600 gpm

t = 5 years

| Well | s(ft) |
|------|-------|
| EW-1 | 16    |
| IW-1 | -16   |

Case 1

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

Q= pumping rate in gpm

b= 100 ft

T= coefficient of transmissivity of aquifer, in ft<sup>2</sup>/day and gpd/ft

K= 99 ft/day

t= time since pumping test started, in days

S= 0.0002

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

T = 9,900 ft<sup>2</sup>/day

S= coefficient of storage (dimensionless)

T = 74,057 gpd/ft

Q = 600 gpm

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|
|         | s   | 264      | Q               | T                       | t                                 | r                     | S                   |        |                          |                             |
| EW-1    | 28.46                                     | 264      | 600             | 74,057                  | 1825                              | 0.1                   | 0.0002              | 2.14   | 2.0273E+13               | 13.30691995                 |
| IW-1    | -12.30                                    | 264      | 600             | 74,057                  | 1825                              | 600                   | 0.0002              | 2.14   | 563141.391               | 5.750617449                 |

Note: Analysis run under the assumption of no increase or decrease in available storage

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft

Q= pumping rate in gpm (Attenuated over a period of time)

K= 99 ft/day

T= coefficient of transmissivity of aquifer, in gpd/ft

S= 0.0002

t= time since pumping test started, in days

T = 9900 ft<sup>2</sup>/day

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

T = 74,057 gpd/ft

S= coefficient of storage (dimensionless)

Q = 1,200

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

# Thermal Modeling

## APPENDIX C

### THERMAL MODELING

Case Study 1 (in degrees Kelvin)

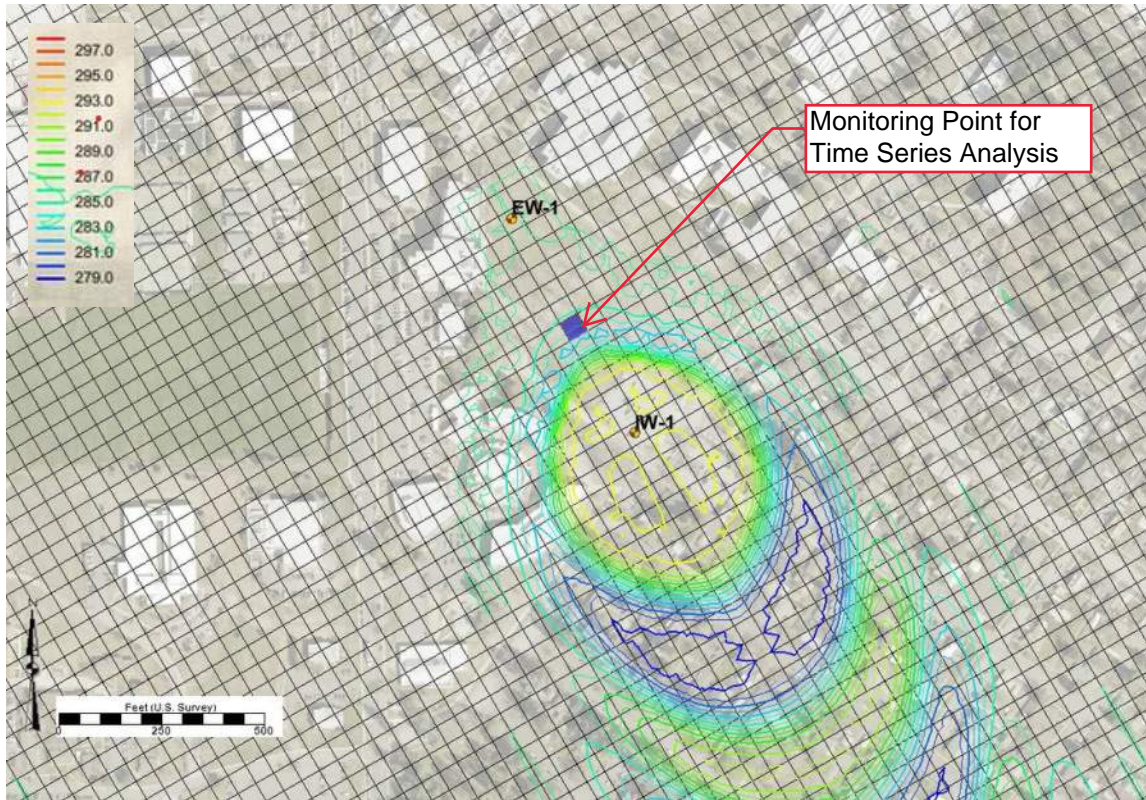

Figure C1. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C2. Timeseries of temperature in a cell in between the EW and IW (blue highlighted cell in the image above – about 300 ft down-gradient of the extraction well).

Case Study 2 (in degrees Kelvin)

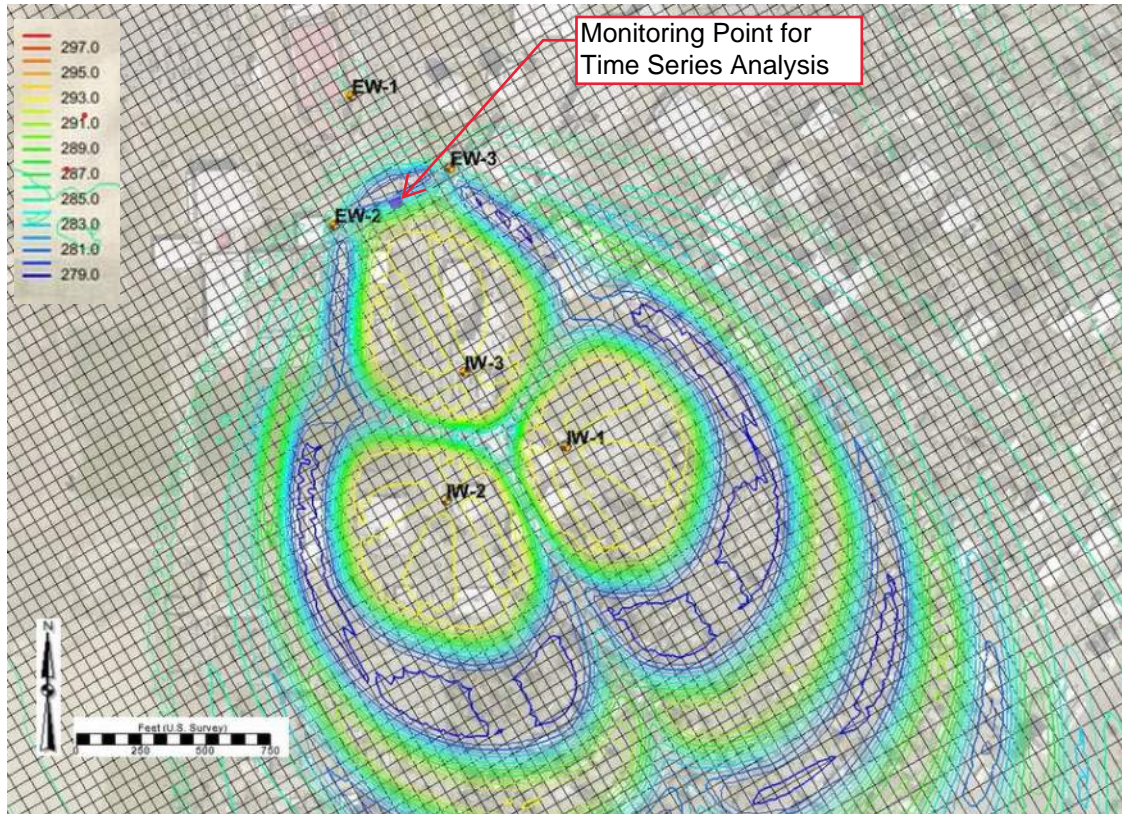

Figure C3. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C4. Timeseries of temperature in a cell in between the EW-2 and EW-3 and IW (blue highlighted cell in the image above).

Case Study 3 (in degrees Kelvin)

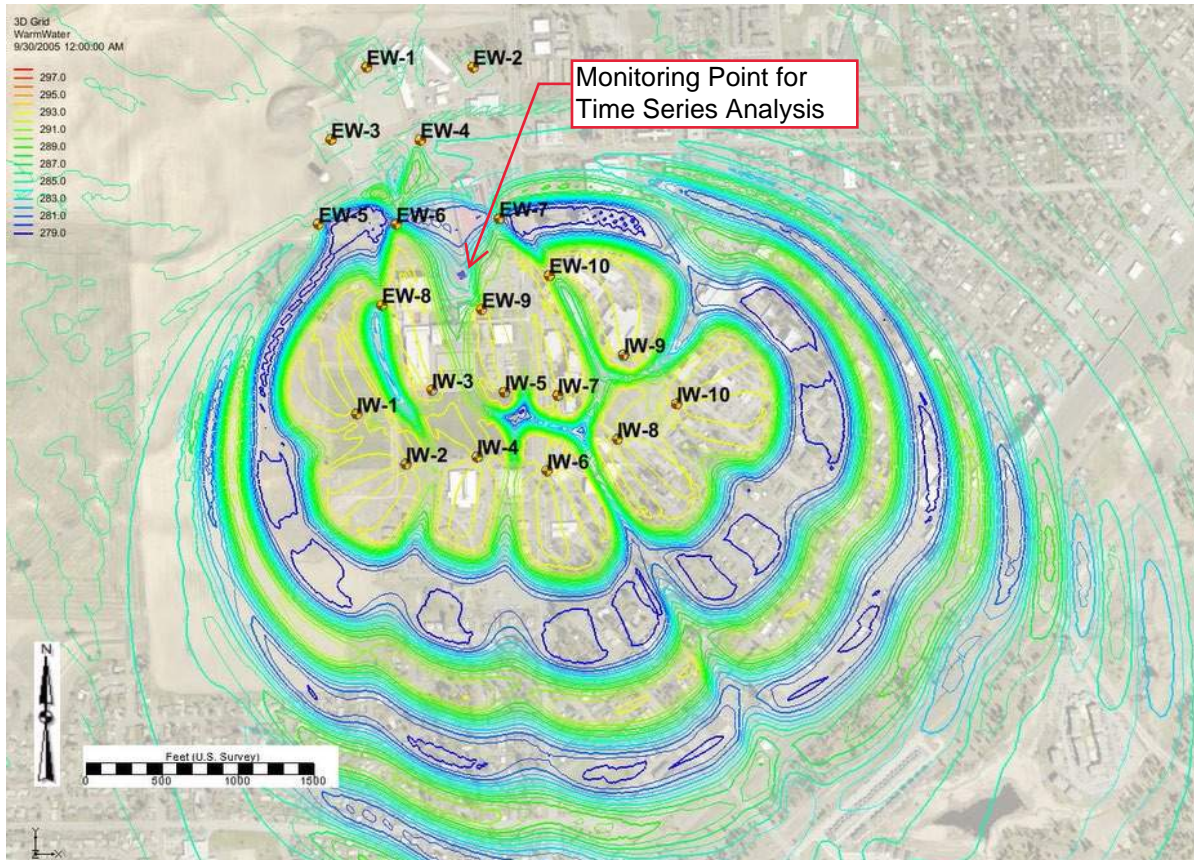

Figure C5. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C6. Timeseries of temperature in a cell in between the EW-6, EW-7, EW-8, EW-9, and EW-10 (blue highlighted cell in the image above).

# Water Right Application

# Application for a New Water Right Permit

Form No. ECY 040-1-14 (Rev 05-2020)

- Refer to accompanying guidance to complete this form.
- We strongly encourage applicants to seek pre-application consultation prior to applying.
- Incomplete applications will be returned.
- All fees are non-refundable (RCW 90.03.470(13)).

### ADA Requests

To request ADA accommodation including materials in a format for the visually impaired, call Ecology Water Resources Program at 360-407-6872. People with impaired hearing may call Washington Relay Service at 711. People with speech disability may call TTY at 877-833-6341.

# WATER RESOURCES PROGRAM

## Application for a New Water Right Permit

For Ecology Use  
(Date Stamp)

**I am applying for a:**

- New groundwater right permit
- New surface water right permit
  
- Short-term water right permit (less than 4 months, non-recurring)  
 Dates the water will be needed:  
 FROM: \_\_\_\_ / \_\_\_\_ / \_\_\_\_  
 TO: \_\_\_\_ / \_\_\_\_ / \_\_\_\_
  
- Cost Reimbursement Processing
- Drought (see Attachment A)

**Required submittals:**

- A \$50 filing fee. This fee is not required for drought or cost reimbursement applications.
- A map showing the proposed point(s) of diversion/withdrawal and place(s) of use.
- A copy of the legal description of property where the water will be used (taken from a real estate contract, property deed, or title insurance policy).
- If platted property, a complete copy of the plat map.

**Date of pre-application consultation with Ecology:** \_\_\_\_\_  
**Name of Ecology contact for pre-application:** \_\_\_\_\_

### 1. Applicant Information (Complete all applicable boxes)

## 2. Project Description

Attach a report with responses to the following required information, and reference the section number in your responses.

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 2.1     | Provide a brief narrative explaining the general nature and intent of the proposed water use.  |              |
| 2.2     | If the proposed water use will include a diversion from a new or permitted reservoir, list any associated water rights, and the means of withdrawal. |              |
| 2.3     | Attach a copy of any SEPA checklists or environmental analyses related to this project with this application.  |              |
| 2.4     | Describe how you will measure and control the rate and volume of your diversion or withdrawal.   |              |

## 3. Purpose(s) and Period of Use

List all purposes for which water will be applied to a beneficial use, and provide the quantity required for each.

| PURPOSE(S) OF USE | RATE (CHECK ONE BOX ONLY)<br><input type="checkbox"/> CFS<br><input checked="" type="checkbox"/> GPM | ACRE-FEET PER YEAR (AF/YR) | PROPOSED NUMBER OF IRRIGATED ACRES | PERIOD OF USE (CONTINUOUS, OR DATES OF PROPOSED USE) |
|-------------------|--|----------------------------|------------------------------------|--|
| Heat Exchange     | 12,000   | 0                          | 0                                  | Continuous   |

|            | SW  | 12  | 23N | 41E |         |   |                           |
|            | NW  | 13  | 23N | 41E |         |   |                           |
|            | NE  | 14  | 23N | 41E |         |   |                           |

Outline the area to be irrigated on your attached map, if applicable.

|   |           |               |
|---|-----------|---------------|
| LEGAL LANDOWNER OF PROPOSED PLACE OF USE<br>(IF DIFFERENT THAN APPLICANT) | PHONE NO. | ALT PHONE NO. |
| ADDRESS   |           |               |
| CITY  | STATE     | ZIP CODE      |
| EMAIL ADDRESS (IF AVAILABLE)  |           |               |

Attach additional sheets as necessary.

## 7. Related Water Rights (if applicable)

| Section | Required information  | Reference(s) |
|---------|---|--------------|
| 7.1     | List any other water rights (applications, permits, certificates, or claims) related to this application. Include any rights that overlap the place of use. |              |
| 7.2     | Explain how the water rights listed above have been exercised.  |              |

## 8. System Design and Operation

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 8.1     | Provide a description of the proposed water supply system from the point of diversion or withdrawal to the proposed place of use.  |              |
| 8.2     | Provide preliminary design plans and specifications for the proposed use, including diversion or withdrawal and conveyance facilities, if applicable, and the proposed flow rate and volume design capacity. |              |
| 8.3     | Provide the projected system efficiency.   |              |
| 8.4     | <b>For surface water diversions</b> , describe how your plans comply with WDFW fish screening requirements.  | RCW 77.57    |

## DEVELOPMENT SCHEDULE

| Section | Required information  |  |
|---------|---|--|
| 8.5     | Provide a general timeline that includes the steps needed to begin the project, complete the project, and put the water to full beneficial use. |  |
| 8.6     | Identify and discuss other land-use or environmental permits required and the timeline to obtain those permits.                                 |  |

## 9. Hydrogeologic Analysis

We strongly recommend that applicants consult with Ecology in a pre-application meeting prior to conducting any hydrogeologic work, to determine the scope of data required for processing this application.

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 9.1     | If known, describe the hydrogeologic setting and identify all groundwater bodies and surface water bodies involved.  |              |
| 9.2     | <p>If known, describe:</p> <ul style="list-style-type: none"> <li>• Geographic recharge and discharge areas</li> <li>• Seasonal variations of groundwater elevations</li> <li>• Interrelationships between surface water and groundwater, and between aquifers</li> <li>• Barriers to flow</li> <li>• Hydrologic boundaries</li> </ul>   |              |
| 9.3     | <p>Attach any available well information including:</p> <ul style="list-style-type: none"> <li>• Water well report</li> <li>• Well diameter and depth</li> <li>• Motor and pump specifications (i.e., make, horsepower, and type)</li> <li>• Pump test data</li> <li>• Well locations (must be identified as outlined in Section 11)</li> </ul>  |              |
| 9.4     | <p>If known, describe the following characteristics of the aquifer, and cite the source of that information:</p> <ul style="list-style-type: none"> <li>• Aquifer transmissivity</li> <li>• Aquifer storage coefficient and specific yield</li> <li>• Saturated thickness</li> <li>• Aquitard leakage</li> <li>• A detailed description of groundwater-flow boundaries</li> <li>• Water-level hydrographs for wells</li> <li>• Associated water-quality information</li> </ul> |              |

If your proposed water use impacts or impairs a protected water source or an existing water right, you will need to discuss mitigation options in **Attachment B** with the appropriate regional office.

## 10. Environmental Assessment

| Section | Required information   |  |
|---------|--|--|
| 10.1    | Describe the aquatic uses of any related surface water bodies (i.e., fish and wildlife, recreation and aesthetic, water quality, etc.).  |  |
| 10.2    | Indicate whether the related surface water is fish-bearing, including whether it is inhabited by salmonids. List species and the times of year they are present. <a href="https://apps.wdfw.wa.gov/salmonscape/">https://apps.wdfw.wa.gov/salmonscape/</a> |  |

## 11. Driving Directions

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 11.1    | Site address, and detailed driving directions to the project site. |              |

## 12. Maps and Other Documentation

| Section | Required information   |  |
|---------|--|--|
| 12.1    | <p>Attach detailed map(s) clearly indicating the following:</p> <ul style="list-style-type: none"> <li>The proposed places of use for all rights related to this application. If any overlapping water rights for the place of use, or multiple rights that share the same point(s) of diversion/withdrawal exist, provide one map depicting all of the historic points of diversion, means of conveyance, and places of use. Identify related rights as such by water right number.</li> <li>The county parcel numbers for the proposed place of use, unless the place of use is for a large service area such as that served by an irrigation district or municipal water system. Identify the name of the irrigation district or the water system, if applicable.</li> <li>The proposed locations of the point(s) of diversion/withdrawal.</li> <li>The names, informal or formal, used to identify each point of diversion/withdrawal (e.g., Well No. 1, River Well, S01, Smith Dam, etc.).</li> <li>A grid layer referencing Section, Township, and Range of the area.</li> <li>The location of the water delivery system and other such features relevant to your proposed application (e.g., mainlines, reservoirs, booster pumps, etc.)</li> </ul> |  |

# Attachment A: Drought Authorizations

**Note:** In order to apply for a new temporary drought permit, applicants must be conducting a previously established activity under a valid water right permit, certificate, or water right claim within an area covered by a formal drought declaration. (WAC 173-166).

Complete this attachment and the following sections of the Application for a New Water Right:

- Sections 1 through 5
- Section 11. Maps and other Documentation

| Section | Required information   | Reference(s)   |
|---------|--|----------------|
| A.1     | Describe the specific circumstances pertaining to your water shortage. Describe how existing water rights are insufficient to address these impacts due to the drought.  |                |
| A.2     | Describe how the water right proposed will address these impacts.  |                |
| A.3     | Have you had any previous drought-specific authorizations for the subject parcels?<br>If yes: <ul style="list-style-type: none"><li>• What are the Drought Authorization numbers?</li><li>• Did those former authorizations cause impairment to other water users?</li></ul> | RCW 43.83B.410 |

## Attachment B: Mitigation Plan

| Section | Required information  | Reference(s)   |
|---------|---|--|
| B.1     | Identify the source of supply for the proposed mitigation water.  |  |
| B.2     | Estimate the consumptive quantity of water for the proposed use. Describe the methodology used to support your estimate.  |  |
| B.3     | Describe how the proposed mitigation would offset the impacts of the proposed withdrawal or diversion.  |  |
| B.4     | Describe the measures that will be taken to ensure mitigation will be maintained for the duration of the water right authorization.   |  |
| B.5     | Provide copies of any agreements between you and other parties regarding mitigation for impacts, if applicable.   |  |
| B.6     | Describe the benefits and costs, including environmental effects, of any water impoundment or other resource management technique that is included as a component of the application.   | RCW 90.03.255<br>RCW 90.44.055                       |
| B.7     | <b><u>For surface water</u></b> , analyze whether there will be any increased water supply from the impoundment or technique, including recharge of groundwater, as a means of making water available or otherwise offsetting diversion impacts.  |  |
| B.8     | <b><u>For groundwater</u></b> , analyze whether there will be any increased water supply from the impoundment or technique, including recharge of groundwater, as a means of making water available or otherwise offsetting the impact of the diversion of surface water.                         |  |
| B.9     | If you intend to offset your new use, describe how and when non-consumptive water returns to groundwater or surface water, and explain how this volume was estimated. Specifically describe how the quantity, timing and location of return flow would change if the proposed permit is approved. | WAC 173-500-050(5)<br>WAC 173-500-050(9)<br>POL 1020 |

Attachment  
EWU Application for Non-Consumptive Water Right  
Proposed Heat Exchange System at EWU Campus

SECTION 2: Project Description

2.1 Brief Narrative

Eastern Washington University (EWU) is evaluating a proposed heat exchange project plan at the EWU campus. This water right application is being submitted to support the non-consumptive use and consists of a phased proposal designed to determine the feasibility and design Ground Source based Heat Pump systems (GSHPs).

The GSHP system proposed by MSI Engineers (engineers under contract to EWU) is an open-loop type system, where groundwater is pumped out of the basalt aquifers, circulated through a heat exchanger, and reinjected back into the earth. Hydraulic and thermal modeling was completed to evaluate hydraulic and thermal capacity of the local aquifer to meet the GHSP demands for each case study (Landau, 2023). Aquifer extraction requires a water right from the Washington Department of Ecology (Ecology) and reinjection requires registration with Ecology's Underground Injection Control program. Permitting considerations are discussed in the appurtenant section below. A detailed discussion of the hydrogeologic assessment, modeling results, well design and recommendations are included in the Landau (2023) report completed for this project.

Closed-loop heat pump systems circulate water through buried piping to exchange heat with the ground, whereas open-loop type systems (Figure 1) pump water directly in and out of the earth, from an available aquifer source. The nature of heat transfer requires closed-loop type systems to utilize a significant number of expensive vertical wells, or large open fields for shallow horizontal loops, whereas open-loop type systems, which use water directly, instead of relying on heat transfer to the earth, only required a few wells. This allows for an economy of both scale and space constraints, especially in the context of a college campus, where open space for multiple wells or heat transfer fields is extremely limited.

The evaluation to be completed at the EWU facility is planned to be undertaken in a phased approach, with the three case studies described below. This application is being submitted assuming the project will continue to full buildout throughout the university. Should the project plans be modified during feasibility and/or construction activities, the application may be modified during development or at the proof of appropriation phase. The three case studies for the project are:

**CASE STUDY – 1: MARTIN-WILLIAMSON HALL GSHP SYSTEM**

The first case to be studied is based around the upcoming project involving the remodel and retrofit of the existing Martin-Williamson Hall facility. Because the existing, aging, HVAC system in Martin-Williamson Hall will be replaced with an entirely new, modern HVAC system, the application of a possible GSHP based system is easy to propose. This phase will require one 16-inch extraction well and one 16-inch injection well. Proposed Qi for the first phase is 600 gpm.

### **CASE STUDY – 2: FOUR (4) BUILDINGS – MICRO-DISTRICT GSHP SYSTEM**

Then, considering the initial M-W case as a likely starting point for the campus transition to GSHP based systems, the nearby buildings that include the JFK Library, the Computing and Engineering Building (CEB) and the Art-Theater-Music (ART) complex, were chosen as part of a so-called Micro-District Heat Transfer Center, under the second case study. This would be a facility where the proposed several open-loop system source wells would deliver the ground water to heat exchangers for the building heat pump systems before the ground water was returned to the ground via the reinjection wells. This phase will require three 16-inch extraction wells and three 16-inch injection wells. Proposed  $Q_i$  for the second phase is 3,600 gpm.

### **CASE STUDY – 3: ENTIRE CAMPUS – GSHP SYSTEMS**

The third, and final, case study would provide a large network of source and reinjection wells, serving multiple micro-district heat transfer centers sprinkled around the campus, to support the entire campus using GSHP systems. This would be the upper boundary case in converting the whole campus to be conditioned by open-loop ground-source type heat pump systems. This phase will require ten 16-inch extraction well and ten 16-inch injection well. Proposed  $Q_i$  for the full campus buildout phase is 12,000 gpm.

Figure 1: Generalized Schematic of Open Loop System.

## 2.2 Diversion and Other Water Rights

The proposed project will not include a diversion from a new or permitted reservoir. The project area is currently within the boundaries of the EWU Water System Service area. Water supplied to the municipal water system is provided by two wells as shown on Figure 2. This service area currently utilizes three water rights. These include:

**Table 1: Summary EWU Existing Water Rights**

| Water Right No. | Type        | Priority  | Type        | Qi (gpm) | Qa (AF) | Irr. Ac. |
|-----------------|-------------|-----------|-------------|----------|---------|----------|
| G3-*09810CWRIS  | groundwater | 9/19/1968 | Certificate | 200      | 162     | --       |
| G3-25018C       | groundwater | 8/9/1976  | Certificate | 150      | 200     | 125      |
| G3-27882C       | groundwater | 5/28/1996 | Certificate | 550      | 520     | 125      |

Note: Water rights above have a provision that the total amount of water authorized for withdrawal under Groundwater Certificates No. 7218-A, G3-25018C and G3-27882C is limited to 900 gallons per minute and 922 acre-feet per year.

This proposal is independent of the three existing water rights currently owed by EWU. These water rights are currently undergoing a proof of appropriation and/or conforming documents for the rights.

## 2.3 SEPA

A SEPA determination evaluates if a proposed water right diversion will cause significant adverse environmental impacts. A SEPA threshold determination is required for:

- Surface water applications for more than 1 cubic feet per second (cfs). For agricultural irrigation, the threshold increases to 50 cfs, if the project isn't receiving public subsidies.
- Groundwater applications requesting more than 2,250 gpm.
- Projects with several water right applications where the combined diversions meet the conditions listed above.
- Projects subject to SEPA for other reasons.
- Applications that are part of several exempt actions that collectively trigger SEPA under WAC 197-11-305.

A SEPA will be required under this application. The SEPA will be completed upon final submittal of this application.

## 2.4 Measuring

The groundwater withdrawal will be measured by a dedicated meter at each of the well heads. Pumping rate and quantity withdrawn and injected will be recorded weekly.

## SECTION 3: Purpose and Period of Use

3.1 – Not Applicable

3.2 – EWU water system has a DOH approved water system plan (WSP) for Water System ID# 21900. This project is proposed to be independent of those water rights.

3.3 - Not Applicable

3.4 – Not Applicable

3.5 – Not Applicable

3.6 – Not Applicable

3.7 – Industrial Use of Water

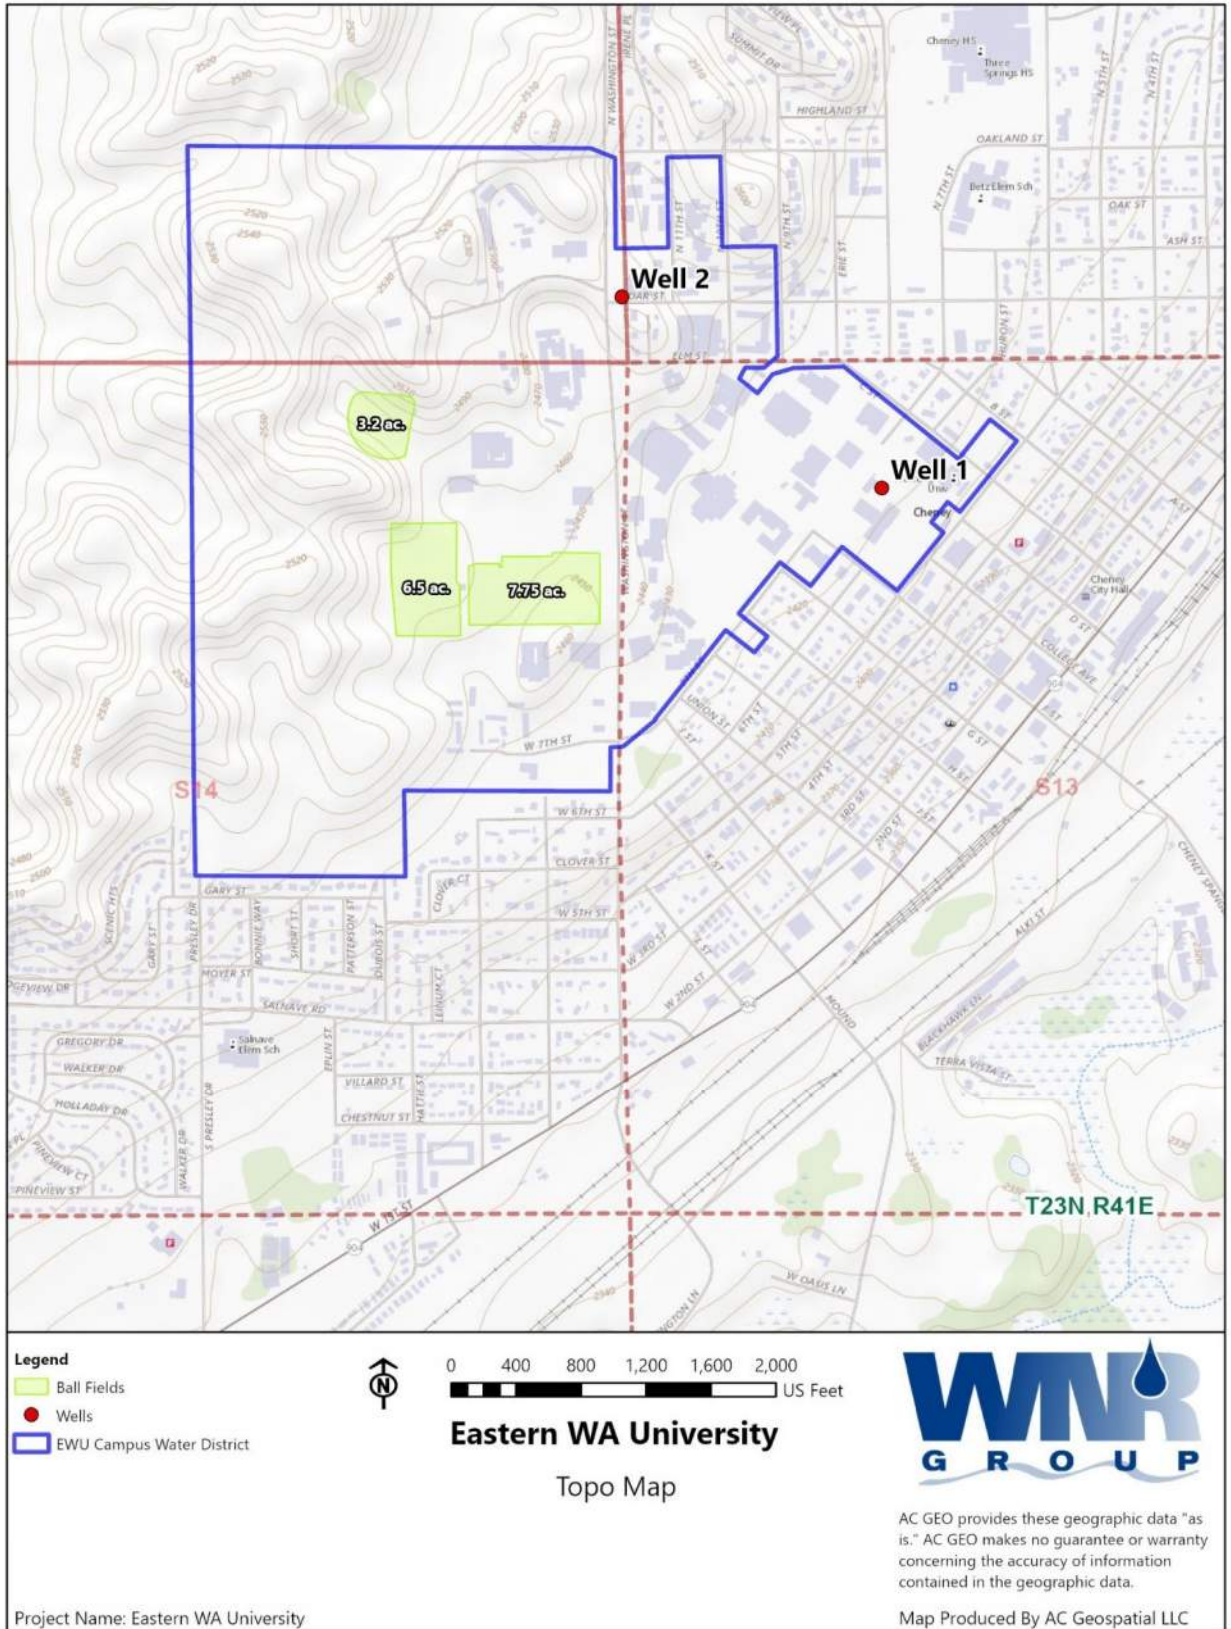

Figure 2: Location of existing municipal wells for EWU service area.

### 3.8 – Description of Use

The primary goal of this project is to provide EWU with information on a possible pathway to reducing fossil fuel use at the existing campus central heating (and cooling) plant, with the ultimate goal of achieving an Energy Efficient, Zero-Carbon campus. As such it will be looking at the availability of, and characteristics of, the existing aquifer water within the Grande Ronde aquifer beneath the EWU campus. The proposed use is using this ground water for the purpose of heating and/or cooling the EWU campus buildings, as this aquifer acts as a heat-source or heat-sink for efficient operation of ground-source heat pump systems. A ground-source heat pump system is an electric energy-based heating and cooling system, rather than a fossil fuel based system, which uses the earth as a source of stable “energy” for extracting or rejecting heat to (i.e., heat sink or heat source), for the purpose of heating or cooling buildings. Although there are other possible heat pump based systems that utilize the ambient outdoor air, rather than the earth, as the heat source or heat sink, using the earth is considered more efficient, since the thermal mass is much more dense than air, and the typical 50 to 60 deg. F ground temperatures are also more stable than the air, which can vary well over 100 deg. F throughout the seasons.

The heat exchange process calls for pumping water from the proposed source (extraction) wells, passing it through a heat pump exchange unit, for the purpose of heat generation, and then injecting it back into the ground through the proposed injection wells, currently planned at approximately a 600-foot spacing. The intent is to have the full discharge from the heat exchange system return to the source aquifer within a short time of being withdrawn. By doing this, the purpose is considered a non-consumptive use. The standard for the project is for the water to be returned to the same aquifer location from which it was withdrawn without any changes to its chemical content. The project will also require approval through the Underground Injection Control registration, discussed later in this document.

The use of water is proposed for heat exchange purposes and is defined in statute as a beneficial use (RCW 90.54.020(1)) and Ecology Policy-2020. The use is defined as a non-consumptive use.

#### SECTION 5: Water Storage

5.1 – Not Applicable

5.2 – Not Applicable

5.3 – Not Applicable

#### SECTION 6

The proposed Heat Exchange project is being evaluated for use within the boundaries of the EWU Water System area. However, the Heat Exchange program will be operated independently of the water supply system currently in use for the university.

#### SECTION 7 – Related Water Rights

7.1 - The EWU facility is currently developing the change to their three water rights shown in Table 1. These three rights are primarily used for municipal water supply and irrigation on the campus. The WNR Group also conducted a screen of the Ecology WRTS database to determine what water rights were within a ½-mile radius of the boundaries of the EWU service area. These results are shown in Table 2 and on Figure 3.

TABLE 2 – WATE RIGHTS AT AND WITHIN ½-MILE OF EWU WSA BOUNDARY

| Water Right No. | Type        | Priority Date | Wtr Rgt Type | Qi (gpm) | Qa (AF/yr) | Irrigated Area Quantity | Purpose Of Use Type Codes   | Name on Certificate           |

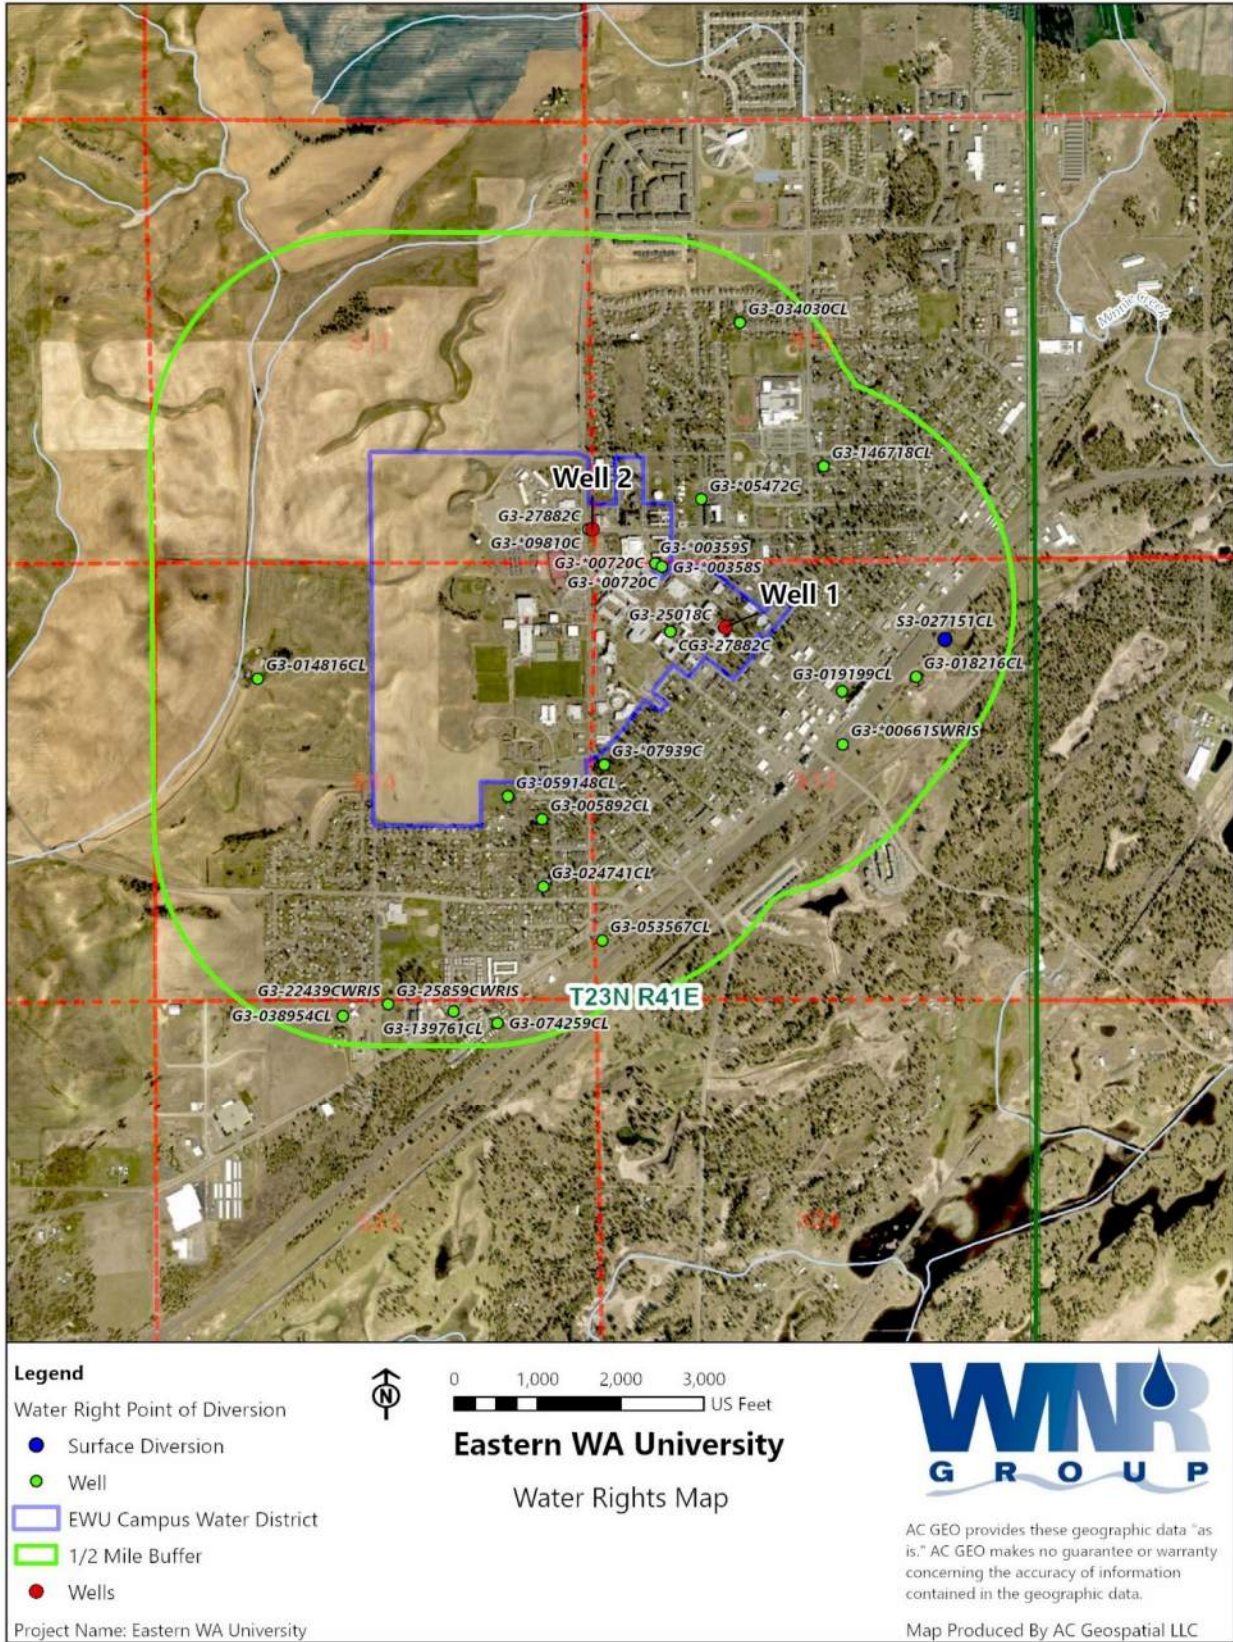

FIGURE 3: Map showing location of water rights within 1/2-mile of EWU Service Area boundaries.

As shown on Table 2, EWU utilizes three water rights within their service area. The City of Cheney also utilizes nine water rights for their water system area. Although the water system areas do not overlap, the City does operate wells within the boundaries of EWU's service area. Outside of the two municipal water purveyors, no other certificates are located within ½-mile of the boundaries of EWU service area. Twelve groundwater and one surface water claims are within ½-mile of the EWU service area as shown in the water right summary Table 2. These claims are all for domestic water use with irrigation less than half an acre and stock watering. Review of well logs show that these small water uses are primarily using water from the shallow Wanapum formation and do not have wells completed into the deeper Grande Ronde aquifer like EWU and the City of Cheney. In addition, all but one of these Claims are located down or cross-gradient of the proposed heat exchange groundwater extraction wells.

7.2 – Water rights currently owned by EWU have been exercised to provide domestic and municipal use within the EWU water service area. Groundwater is also used for irrigation on sports fields around the campus, and for building land scaping and lawn irrigation throughout the campus. EWU is currently undergoing the CWRE evaluation for the proof of appropriation of the changes to these rights and completion of the conforming documents to change the water rights to municipal use. The water right being submitted under this request will be operated independently of the existing water rights and develop its own extraction and injection wells. No shared wells will be utilized under this request and the existing rights.

#### SECTION 8 System Design and Operation

The system design and operation are discussed in detail in the MSI Engineers GSHP Feasibility Report (MSI, 2023) and the Landau Groundwater Temperature Modeling Report (2023). Final design and operations will be based on any results of the feasibility phase of this project.

As discussed previously, three phases are proposed for this GSHP project. Preliminary modelling results completed by Landau (2023) have tentatively determined the proposed place of withdrawal of 10 wells and the proposed placement of ten injection wells. The following figures (4a, 4b and 4c) outline the location of the proposed extraction wells and accompanying proposed injection wells for each of the three phases discussed previously. These locations correspond to the 20 proposed wells included within this application.

### 8.5 Timeline

The timeline on this project will be defined by funding alternatives of the project. Initiation of the first phase of the project, to include the initial extraction and injection well is tentatively projected to be initiated by 2026. Full completion of the project through phase 3 may extend up to 10 years.

### 8.6 Other Permits

The project will first require a water right permit for the GSHP. Typically, new water right applications are acted upon in the order which they are received by the Department of Ecology, who assigns their priority date. Certain new water right applications are granted priority processing dependent upon certain proposed project requirements and conditions. Under WAC 173-152-050(2), an application may be priority processed if Ecology determines that: “the proposed water use is non-consumptive and if approved would substantially enhance or protect the quality of the natural environment (WAC 173-152-050(2)(b)). Ecology also has Policy 2020 – Priority Processing of Heat Pump Applications”. This policy also states that a withdrawal for heat exchange purposes may be afforded priority processing if the conditions under WAC 173-152-050(2)(b) are met.

Ecology Policy 1020 governs determination of consumptive vs. non-consumptive water use. The policy defines groundwater use as non-consumptive when “there is no diminishment of the source.” As proposed with this project, the groundwater withdrawn for the GSHP will immediately be injected back to the source “in the same quantity and quality (excluding temperature change) at a point in close proximity to the withdrawal wells. As shown previously in this document, this proposed project meets these standards.

The EWU GSHP proposed open-loop heat exchange system meets the criteria set forth in WAC 173-152-050(2)(b) and as such, Ecology should afford it a priority processing status.

As discussed previously, the proposed water right application exceeds the 2,250-gpm limit, and as such will require submitting the SEPA checklist. The SEPA process will be conducted upon submittal of the water right application.

The project will also be required to register in the “Underground Injection Control Registration” administered by Ecology. Owners or operators of proposed — or existing — underground injection control wells must register their wells online using the SecureAccess Washington website. All injection wells must either receive a program rule authorization or a state discharge permit in order to operate. Ecology guidance states that:

Heat pump/air conditioning (HAC) systems return water back into the subsurface groundwater after it has been used to heat or cool a structure by means of an Underground Injection Control (UIC) well — or injection well.

*HAC systems heat or cool buildings by:*

- *Extracting heat energy from groundwater.*
- *Using groundwater as a heat sink (heat is absorbed) when cooling.*

*Ecology's Underground Injection Control rule, Chapter 173-218 WAC, authorizes open-loop HAC system wells when a well is registered and the environmental protection requirements of the rule are met.*

The following conditions are required to authorize HAC systems as an injection well:

- No chemicals are added to the HAC system.
- HAC system meets water right permitting requirements.
- Discharges from wells do not affect the water quality in nearby waters on the 303(d) polluted waters list.
- Discharges from wells do not affect the water in nearby waters with a Total Maximum Daily Load (water quality cleanup) plan.
- Discharges from wells do not affect groundwater quality by concentrating or redirecting existing contaminant plumes.
- Groundwater used in the HAC system must be discharged back to the source aquifer.

EWU will coordinate with Ecology upon water right permit authorization to assure all injection well requirements are met.

#### SECTION 9 HYDROGEOLOGICAL ANALYSIS

9.1 THROUGH 9.4 – For detailed hydrogeologic interpretations, see the Hydrogeologic Report's cited in this application. Groundwater use for the proposed project exists in a basalt aquifer at the site. The existing EWU municipal system currently withdraws groundwater from two wells in the Grande Ronde basalt, which will also be the target aquifer for this project.

The WNR Group reviewed the Washington Division of Geology and Earth Resources geologic map for northeastern Washington (1991). The geologic map (Figure 5) revealed that the new and proposed sites are underlain by Miocene Wanapum basalts (Mvw) which overlie the deeper Grand Ronde basalt. The Columbia River Basalt Group, of which the Wanapum and Grande Ronde are members, represent a vast outpouring of basaltic lava flows from vents in eastern Oregon and southwestern Washington and Idaho from about 17 to 6 million years ago (Johnson et al, 1998). The two units exposed in Spokane County (Wanapum and Grande Ronde), were erupted from vents in Idaho and flowed to the Pacific Ocean. The Wanapum and Grande Ronde primarily consist of a black to dark gray fine-grained (Grande Ronde) to coarse-grained (Wanapum), basalt (Johnson et al, 1998). These units typically host multiple aquifers in the interflows or where they are heavily fractured.

The stratigraphic sequence beneath EWU can be generalized as follows (in feet below ground surface):

- Zero to 50 feet of unconsolidated surficial deposits; sand and gravel and wind-deposited silts.
- 50 – 1,300 feet of CRBG,
  - 50 – 300 ft, Wanapum basalt unit and sedimentary interbeds
  - 300 – 1,000 ft, Grand Ronde basalt unit and sedimentary interbeds
- 1,300 feet and below, Pre-CRBG basement rock (Kahle 2011, Buchanan 2007, and well log interpretation).

The following is presented from an Ecology Memo dated March 13, 2008 which described the hydrogeologic conditions for a proposed change to the City of Cheney water rights.

The area is underlain by the Columbia River Basalt Group, of which there are two major zones of public groundwater: the unconsolidated zone, and the basalt. The unconsolidated zone extends from the land surface down to the first solid basalt flow. It consists of unconsolidated and weakly consolidated sediments, chiefly sands, and gravels.

The basalt zone is part of a large groundwater reservoir occurring in a thick series of basalt flows. These flows primarily consist of the Saddle Mountain, Wanapum and Grand Ronde formations. Groundwater is found in a system of interconnected aquifers within the formations of the Columbia River Basalt Group.

The proposed project lies near the margin of the Columbia River Basalt Group. Steptoes consisting of pre-Cenozoic rocks lie to the north of Cheney. Miocene age Wanapum Basalt is exposed to the south and west of Cheney. The Wanapum basalt overlies the older Grand Ronde basalt, and a sedimentary interbed may be present at that contact.

Hydraulic heads indicative of the Grand Ronde aquifer do not necessarily appear at the base of that sedimentary interbed. Often, the hydraulic head does not appear until wells penetrate up to 200 feet into the Grand Ronde basalt. High hydraulic heads, typical of the overlying Wanapum basalt hosted are often closely connected to shallow groundwater.

Groundwater flow in the Cheney area is from SSW to SW with aquifers recharging along the margins of the basement outcrops which are exposed north of Cheney, or though the basin margins for the deeper basalt interflows. No evidence of significant connection to surface water is available.

Research compiled under this study and summarized in Landau (2023) temperature modeling report documents that the principal aquifer in the region is contained within the Columbia Plateau Basalt flows of the Wanapum and Grand Ronde formations. Regionally, these basalt flows erupted over a 10 million year period beginning approximately 16 million years ago. Each individual flow is typically 50 to 100 feet thick. Water migrates laterally through the high permeability interflow zones which are located at the intersection of the top of the underlying basalt flow and the bottom of the overlying basalt flow. The dense, basalt flow interiors typically display vertical hydraulic conductivity values that are orders of magnitude lower than the much higher conductivities of the interflow zones.

The CRBG aquifer system is a series of vertically stacked confined or semi-confined basalt aquifers with water concentrated interflow zones, i.e., the zone between two individual basalt flows. Interflow zones include a flow top, a flow bottom, and a sedimentary interbed if present. Interflow structures can include vesicular and/or brecciated flow tops, flow-bottom pillow complexes and/or brecciated zones, these features create permeability and storage (Kahle 2011). Water reaches the interflow zones and recharges the aquifers by downward percolation or by lateral groundwater inflow (Luzier and Burt 1974). Movement of groundwater vertically along joints in the basalt is estimated to be several orders of magnitude lower than the horizontal range of

movement. City of Cheney wells 1, 2, 3, 6 and 7 are developing in the CRBG aquifer, as are EWU wells 1 and 2R (Parametrix 2019).

The CRBG consists of the Saddle Mountain Basalt unit, Wanapum Basalt unit, and the Grande Ronde Basalt, and their sedimentary interbeds. The Wanapum and the Grande Ronde Basalts are present in the Cheney area, the Wanapum Basalt underlies the Grande Ronde Basalt. The Grande Ronde is the deepest and most-voluminous unit and the most productive basalt aquifer. The Grande Ronde Basalt aquifer is mostly confined and is recharged by lateral groundwater inflow. The Wanapum Basalt aquifer is partially recharged by precipitation and infiltration and is the source of water for many springs and lakes in the Cheney area (Buchanan 2007).

Well logs in and around the EWU campus record a substantial sedimentary interbed at depths of 500-600 feet bgs and a thickness of 75-100 feet. Previous hydrogeologic studies have interpreted this to be the Latah formation, which is broadly understood to have been deposited between the Wanapum Basalt and the Grande Ronde Basalt (Kahle 2011 and City of Cheney wellhead protection plan). However, recent geochemical analysis of samples collected from City of Cheney Well 5 identified the contact between the Wanapum and Grande Ronde Basalts at about elevation 2,200' (200-300 ft bgs) (Buchanan 2007 and GeoEngineers, 2015). This correlates to an approximate Wanapum Basalt thickness of 220 and 280 in the EWU campus area. Locally the Latah formation has been interpreted as a confining layer that restricts groundwater flow based on higher heads in the Wanapum Basalt relative to the Grande Ronde Basalt (Buchanan 2007).

A generalized geologic cross-section beneath the site is presented in Figure 6. The target aquifer for this project will be the lower Grand Ronde basalt Formation.

Figure 6: Generalized Geologic Cross Section in the area of EWU

**Site Groundwater Conditions** – A detailed review of well logs and available hydrogeologic data and reports were conducted for this study. At the Existing subject site, the groundwater within the Grand Ronde member was determined to have the following aquifer characteristics. The Columbia River Basalt Group is a regional aquifer system, and the Grand Ronde Aquifer extends across the basin. The aquifer hydraulic parameters may vary dependent upon the specific geologic conditions at a specific location within the basin. The following are the most representative parameters the project evaluation could develop.

**Aquifer Hydraulic Parameters**

Well testing and hydrogeologic reports were reviewed to estimate hydraulic parameters for the Grande Ronde aquifer in the vicinity of the EWU campus.

**Table 3. Hydraulic Parameters**

| <b>Model Parameter</b>                        | <b>Value</b> |
|---|--------------|
| Aquifer Transmissivity (ft <sup>2</sup> /day) | 9,900        |
| Aquifer Storativity (unitless)                | 0.0002       |
| Static Water Level (ft bgs)                   | 300 – 400    |
| Hydraulic Gradient                            | 0.01         |

**Aquifer Transmissivity**

Aquifer transmissivity (T) describes the ability of the aquifer to transmit groundwater throughout its entire saturated thickness. Transmissivity is the product of hydraulic conductivity (i.e., the capacity of the aquifer material to transmit water) and aquifer thickness:

$$T = Kb$$

Where K is transmissivity and b is aquifer thickness. Transmissivity can be determined via pumping tests, analysis of aquifer material, or calculations based on laboratory tests. Of these methods, transmissivity values established during pumping tests are the most accurate and should reflect the true hydraulic conditions within an aquifer. Due to the heterogeneity of hydraulic conductivity in the Grande Ronde Basalt aquifer and variability in saturated aquifer thickness, pumping test data from onsite EWU Well 2R is anticipated to be most representative of local conditions (versus pumping test data from wells at greater distances from campus).

In 2015, pumping tests were completed on a new water supply well (Well 2R) installed on EWU campus. Analysis of the constant-rate pumping test data estimated an aquifer transmissivity range of 9,900 ft<sup>2</sup>/day to 14,000 ft<sup>2</sup>/day, using the Cooper-Jacob graphical method and the Theis recovery method, respectively (GeoEngineers 2015). For conservatism, the lower transmissivity value was selected for modeling purposes.

The pumping well screen was open to 225-ft of the aquifer, and approximately 100-ft of that interval was water-bearing interflow zones, therefore for modeling purposes an aquifer thickness of 100-ft was used.

### Aquifer Storativity

Aquifer storativity (S) is a measure of an aquifer's ability to store and release water and is defined as the volume of water that a unit will absorb or release from storage per unit surface area per unit change in head. Storativity is also known as the storage coefficient and is typically expressed in units of cubic feet per cubic foot, a dimensionless quantity. Storativity cannot be estimated from a pumping test without observation well data (testing of Well 2R did not include observation wells), therefore, a representative value was selected from available literature. The estimated median storage coefficient for the Grande Ronde unit of the CRBG is 0.0002 (Kahle, 2011).

### Static Water Level and Hydraulic Gradient

Groundwater levels in the Grande Ronde basalt unit are around between 2,100 and 2,200 ft elevation in the Cheney area (Whiteman 1986), i.e., between 300 and 400 ft bgs in the EWU campus area. The groundwater flow direction is interpreted to be to the south-southeast with a gradient of 0.01.

During the production well evaluation at Well 2R, completed in 2015, the static groundwater level in the Grande Ronde Basalt aquifer unit was approximately 350 feet bgs (GeoEngineers 2015). The groundwater level was monitored for a 7-day period under non-pumping conditions. A cyclic fluctuation of 1½ feet was recorded and interpreted to be interference associated with the pumping cycle at Well 1. On a larger timescale, existing historical data indicate that groundwater mining is occurring in the aquifer system beneath the City of Cheney and modeling efforts predict that the rate of water level decline will increase as pumping demands grow with anticipated increases in City population (Buchanan, 2007).

Groundwater levels in the basalt units generally mimic the dip of the basalt, because most groundwater occurs and moves in the interflow zones (Kahle 2011). Groundwater flow in the CRBG near the Cheney area is generally to the south and southwest, towards the center of the Columbia Basin. However, flow in the Grande Ronde Basalt aquifer in the area of the EWU campus appears to be to the south-southeast due to the presence of a groundwater trough to the southeast of Cheney. Grande Ronde groundwater elevation contours are presented in Figure 4 (Whiteman 1986). Groundwater flow direction should be confirmed in the next phase of project design; it is an important design variable for sustaining groundwater temperature targets at the source well.

The altitude of the Grande Ronde Basalt Member (from the USGS WRI Report 87-4238, Sheet Three) for a well in the SE¼ Sec. 11, SW¼ Sec. 12, NW¼ Section 13, or NE¼ of Sec. 14, T. 23 N. R. 41 E.W.M. is approximately 2175'. With a land surface of ~2450', this puts the top of the Grande Ronde at approximately 275' below land surface. The casing call for a well at this site would be estimated at 475' below land surface for a Grande Ronde wells at this location.

To properly construct a well in the Grande Ronde Aquifer, the driller will need to case and seal the well as mentioned above to allow for production from only the Grande Ronde Aquifer. The annular space would need to be a minimum of 4-inches greater than the permanent casing. After the casing is sealed in place, the well may be completed by drilling out of the casing until sufficient

water is obtained. Sealing shall be placed from the bottom of the well to the top until undiluted sealing material returns to the surface.

### Impairment Considerations

Impairment is an adverse impact on the physical availability of water for a beneficial use that is entitled to protection. In order to determine potential impairment, the following Theis non-equilibrium well equation analysis was completed.

In order to determine theoretical drawdown in wells at a given distance from the proposed wells, the Theis non-equilibrium equation (1935), modified by Cooper and Jacob (1946) was used as outlined in Driscoll (1986). The equation allows for the calculation of drawdown at any point away from a well pumping at a constant rate. The equation is presented as:

$$s = [264Q/T] * [\log(0.3Tt/r^2 S)]$$

Where:

**s** = drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate;

**Q** = pumping rate in gpm;

**T** = coefficient of transmissivity of aquifer, in gpd/ft

**t** = time since pumping started, in days;

**r** = distance, in feet, from the center of a pumped well to a point where the drawdown is measured;

**S** = coefficient of storage (dimensionless)

A spreadsheet was developed for the equation and is attached to this memo. The equation was run for a pumping rate for each of the proposed phases (600, 3,600 and 12,000 gpm), with time of pumping at 1, 7, 30, 180, and 365 days, at a distance to observation well of ¼, ½, and 1 mile from a proposed theoretical well. The Thesis non-equilibrium equation generally revealed that a pumping rate of 600 gpm (the maximum amount proposed for each individual extraction well in the system) for 365 days drawdown (decline in hydraulic head) in an observation would be 9.34 feet (1/4-mile), 8.05 feet (1/2-mile), and 6.76 feet (1-mile). At a pumping rate of 3,600 gpm for 365 days, drawdown in an observation would be 56.04 feet (1/4-mile), 48.31 feet (1/2-mile), and 40.59 feet (1-mile).

As the proposed project is non-consumptive, the extracted groundwater will be immediately returned to the aquifer through an injection well within 600 feet of its extraction well. This theoretically creates the same mounding values as that calculated in the drawdown analysis, thus offsetting any drawdown or decline of the hydrostatic head. Figure 7 presents a schematic showing the theoretical effects on the potentiometric head gradient created during an open loop heat exchange system.

Therefore, it is assumed that no impairment to wells in the area may occur. Only the City of Cheney wells located within the EWU service area would be within the radius of influence.

Figure 7: Schematic showing the theoretical drawdown and mounding of an open loop heat exchange project.

## SECTION 10: Environmental Assessment

10.1 – Nearest surface water body: An unnamed intermittent creek which is tributary to Browns Lake is located approximately ½-mile north of the facility. The nearest surface water feature is Ames Lake and is located approximately ¾-mile southwest from the facility. There is no evidence of any significant connection to surface water to the basalt aquifers in the area of the site (Ecology, 2008).

10.2 – The project site is located on the Columbia Basalt Plateau and contains some intermittent water bodies perched on top of the basalts. No known salmonids are located in the immediate area of the facility.

## SECTION 11: Driving Directions

11.1 The site is located at: Eastern Washington University campus in Cheney, WA 99004. The site is located approximately 17-miles southwest of Spokane Washington in Cheney, WA in Spokane County. To get to the site, drive east on I-90 from Spokane approximately 10 miles to Exit 270-Highway 904, Cheney. Continue approximately 4 miles south on Highway 904 until entering the City of Cheney. Upon entering Cheney, turn right (west) on Betz Road, and after a mile it will bend to the left (heading south) and becomes Washington Street. Drive approximately one mile to the site location.

## Section 12: Maps and Other Documentation

12.1 – Various Maps are included in this document

Appendix.....26

## Section 1

# Executive Summary

### Key Takeaways

- The decarbonization plan will identify a path to meet EWU's goal of carbon neutrality, and to comply with Washington State HB1390 legislation.
- This is an intermediate deliverable, providing supporting info for the 2025-2027 capital request.
- The preferred decarbonized system is a nodal open-loop geothermal system – the cost of that system is part of a separate request (the Geothermal Node Plant request).
- The budgetary cost of ~\$20,000,000 noted in this report is to connect the first nine buildings to the geothermal system and implement energy efficiency measures. This does not include the cost of the geothermal plant itself.

## Executive Summary

### Introduction and Report Purpose

Eastern Washington University is developing a decarbonization plan with the long-term goal of eliminating fossil fuels at its central heating plant. This plan will not only help EWU achieve its goal of becoming a carbon neutral institution but will also align with the requirements of Washington State's House Bill 1390. This report outlines EWU's preferred decarbonized system vision and provides rough order of magnitude (ROM) costs for connecting the first group of existing buildings to that system and implementing energy efficiency measures. **The preferred decarbonized system is a nodal open-loop geothermal system. The cost of the geothermal plant itself and the associated distribution piping is being developed via the Geothermal Node Plant request. The ROM cost to convert the nine buildings in Figure 1 to the new plant is roughly \$19,800,000.** These are "all in" costs, reflective of the total cost EWU can expect when implementing these projects. Costs at this stage are for budgetary purposes, and will need to be refined during the next stage of development/implementation.

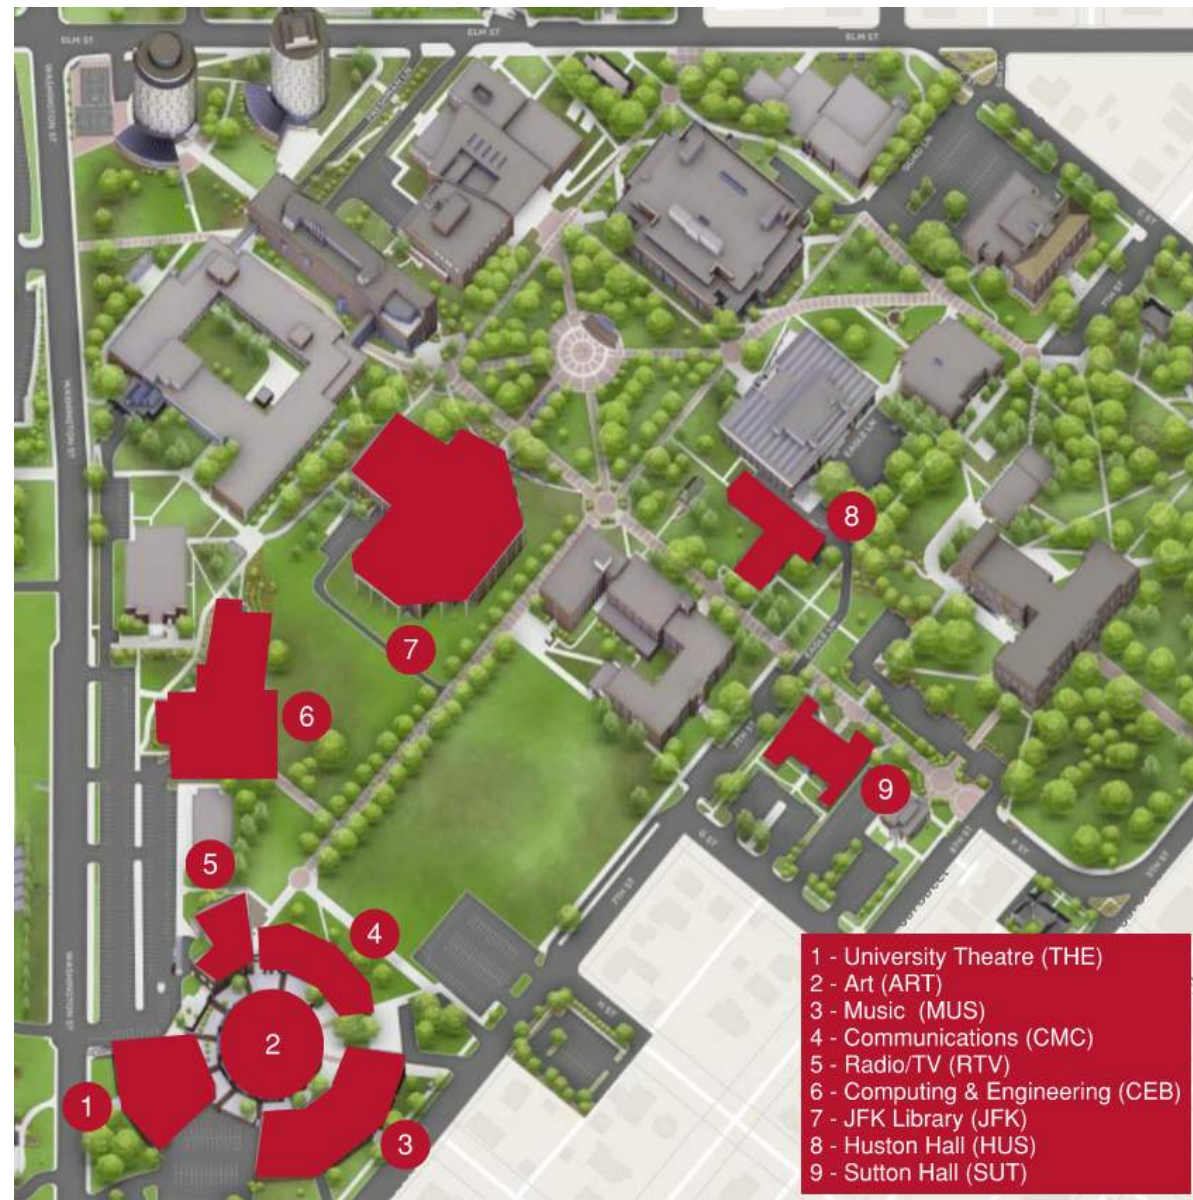

Figure 1: Buildings Connecting to First Geothermal Node

### Key Considerations

- **Capital Request:** This report provides the ROM costs for converting nine existing buildings (see Figure 1) for connection to the first nodal geothermal plant. It also includes the cost of implementing specific energy efficiency measures, which should be implemented simultaneously with the building conversions for optimal value. The cost of the plant and other projects are budgeted through separate efforts as follows:
  - The cost of the first geothermal nodal plant and the associated distribution piping is being provided via the Geothermal Node Plant request.
  - The cost for converting the Martin/Williamson building and connecting it to the first plant is included in a separate Pre-design Estimate (not included here).
- **House Bill 1390 Compliance:** This report forms the basis for the Decarbonization Plan (required for HB 1390 compliance) that will be submitted to the Department of Commerce in 2025. In addition to the long-term goal of removing natural gas, the campus will also need to meet an **EUI target of 112 kBtu/sf/yr (to be confirmed with Commerce)** and to establish **Energy Management and Operations & Maintenance Plans (EMPOM)**. **Converting these buildings and implementing the recommended nodal geothermal system will meet the EUI target required for HB 1390 compliance.** Key dates for 1390 compliance include:
  - 6/1/25: EMPOM period for buildings over 220,000 sf starts (outside the scope of this project)
  - 6/30/25: **Decarb plan** due to Commerce (**in progress**)
  - 2026 and 2027: EMPOM periods start for buildings 90,000 sf - 220,000 sf and 50,000 sf - 90,000 sf (outside the scope of this project)
  - 2030 and 2035: **Decarb Plan** update due to Commerce
  - 2040: Decarbonized campus, EUI target met
- **Funding:** Design and construction of the preferred decarbonized system depends on the State of Washington's continued support of decarbonization efforts (including geothermal technology). Geothermal projects are eligible for federal funding via the Inflation Reduction Act. A tax consultant can quantify the exact funding amount, depending on project phasing and construction. This report does not quantify those benefits.
- **Phasing:** The preferred geothermal nodal system is ideal for long-term phasing. This allows for the cost to be spread out over multiple biennium and provides flexibility in project implementation and sequencing.
- **Capital planning:** The decarbonization plan and capital planning will be strategically aligned. For instance, the demolition of older, less efficient, underutilized buildings not only supports the decarbonization objectives by reducing campus energy consumption but also offsets the costs associated with upgrading these less efficient structures to the new decarbonized system.

## Executive Summary

### Preferred System

Based on the work done to date, a **nodal open-loop geothermal mechanical system** is the preferred system for reducing reliance on fossil fuels at a campus scale. The key components of this system include:

- **Open-Loop Geothermal:** The system will extract and reject heat to and from the aquifer beneath the campus. Electrically-powered water-to-water heat pumps will create heating hot water that will be distributed to individual buildings. This is opposed to the current heating system, which creates heat by burning fossil fuels. **This recommendation is based on the analysis performed in the previous geothermal study, which will need to be validated eventually by a geothermal test well.**
- **Nodal Plants:** The mechanical equipment needed to transfer the heating/cooling to the buildings will be in several smaller plants distributed across campus. This is opposed to the current plant configuration, which houses all heating/cooling equipment in a single central plant building. This approach allows for construction phasing, flexibility, and increased campus resilience.
- **Transitioning from Steam to Hot Water:** The current central system provides building heating primarily via steam. The proposed system will provide heating to buildings via hot water, removing steam as the primary source of heating. This will require new hot water distribution piping across campus. This will most likely employ a mix of low temperature hot water (i.e. 120-130°F) and high temperature hot water (i.e. 160-180°F), depending on the existing mechanical systems in the buildings.
- **Resiliency:** The existing central steam plant will remain in-place to provide backup to the decarbonized system. EWU recently received grant funding to install a carbon capture system on the existing fossil fuel-fired steam plant. In addition, if economics and supply become viable, the steam plant could be fired by renewable natural gas.
- **Cost, Incentives, Construction:** The proposed strategy's modular nature enables a gradual rollout that can be synchronized with the capital budget cycle, extensive renovations, and new construction, allowing for less impact to campus. The system is well-positioned for funding from the Inflation Reduction Act, ensuring the most cost-effective use of resources.

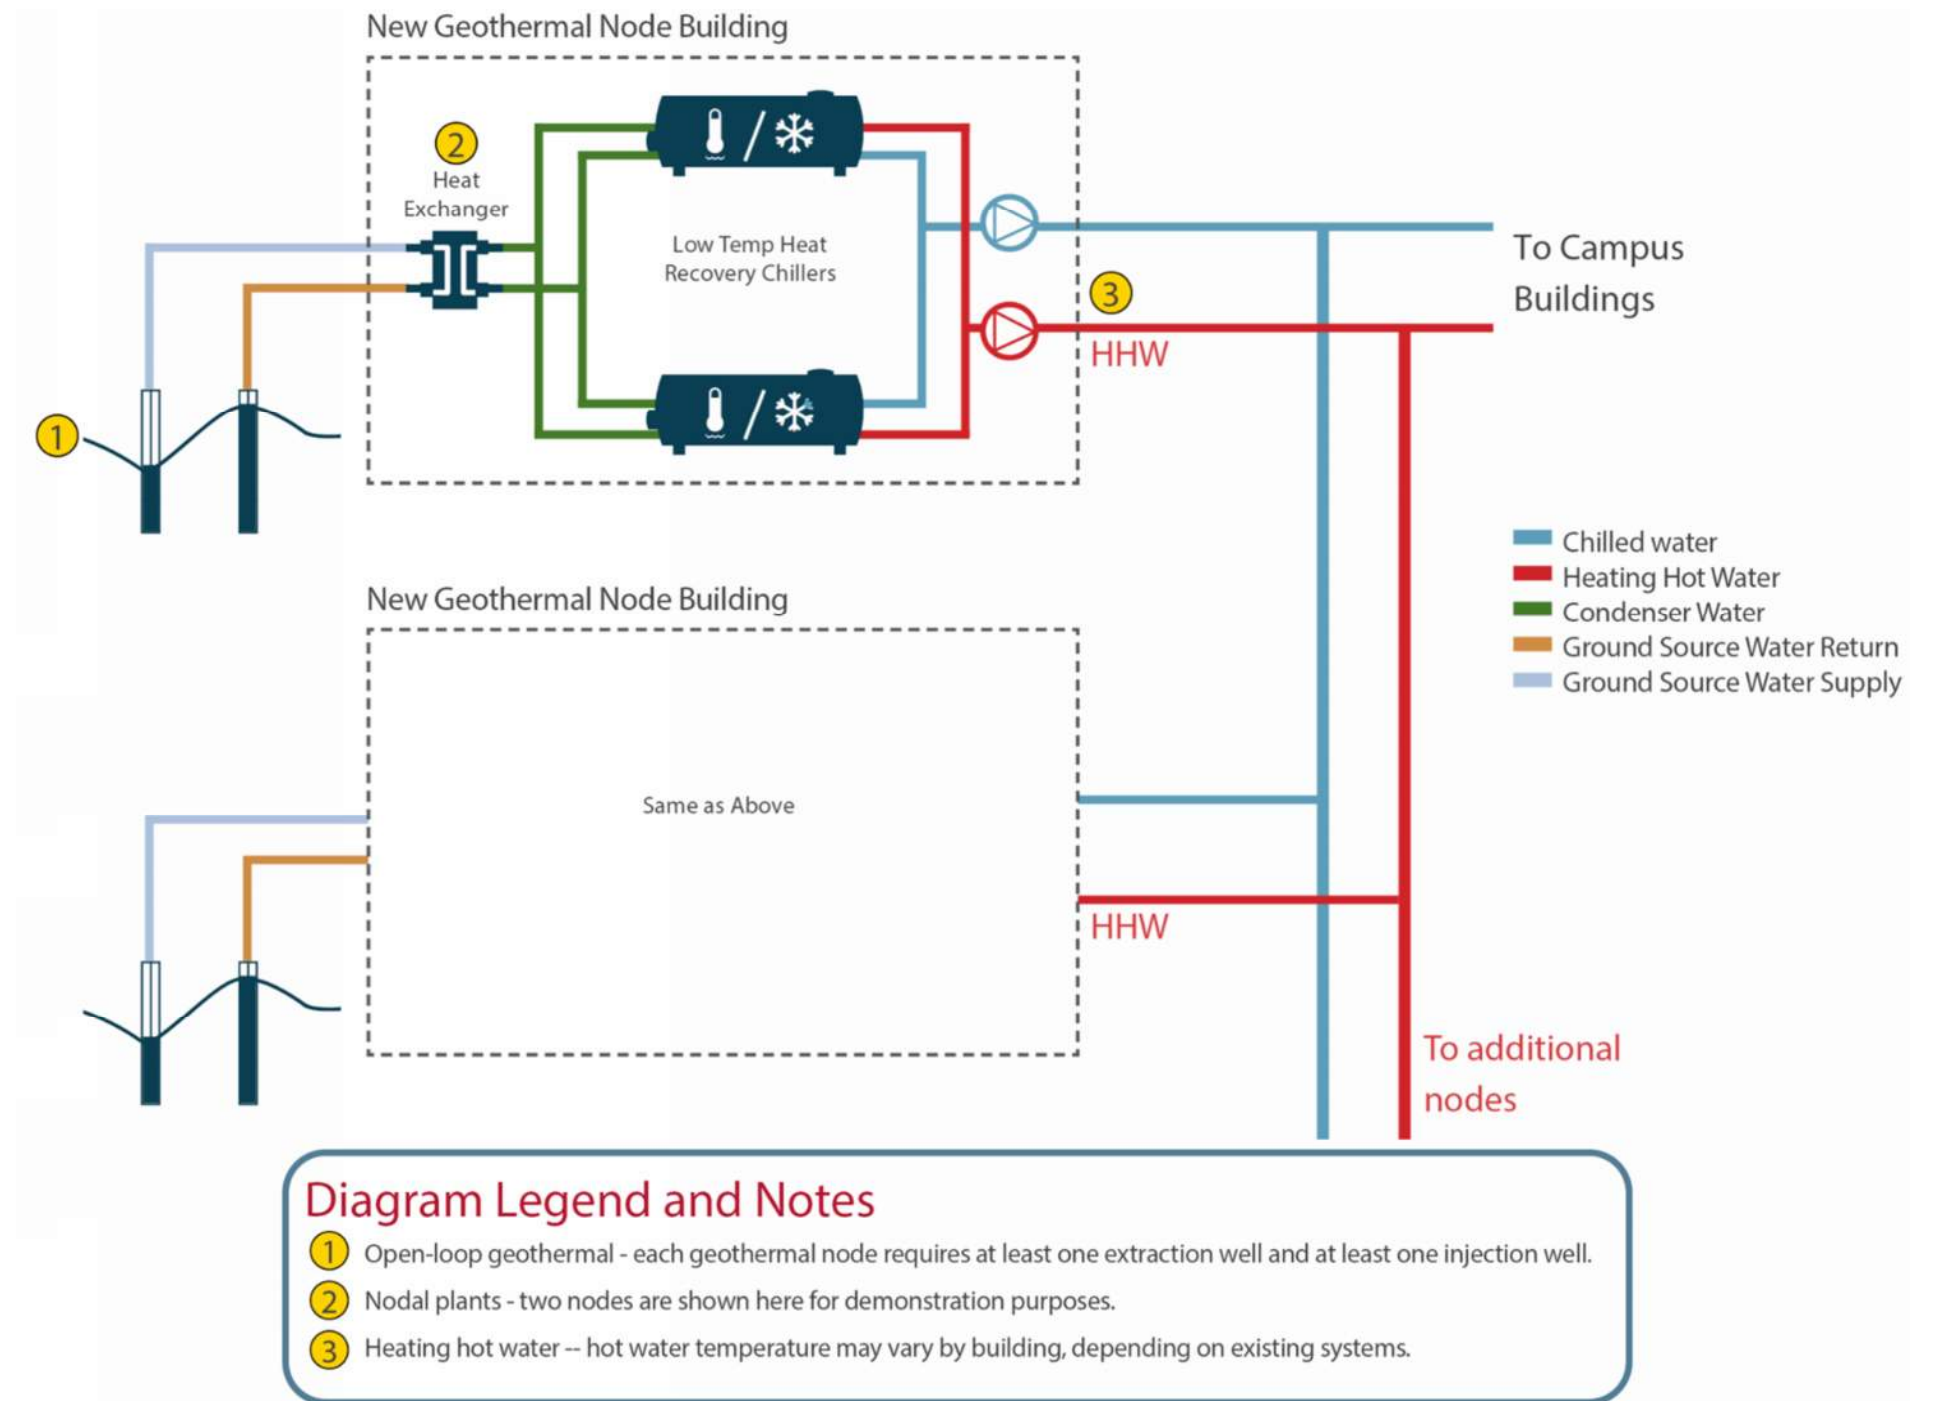

Figure 2: Proposed Nodal Plant Configuration

## Executive Summary

### In-Building ROM Costs

Table 1 presents the turnkey renovation ROM costs to convert the existing buildings to the preferred decarbonized system and implement recommended energy efficiency measures. The extent of these retrofits, the decision-making process behind them, and the recommended measures are described in Section 4 of this report. **These are “all in” costs, reflective of the total cost EWU can expect when implementing these projects. They are ROM costs for budgetary purposes, which will need to be refined during the next stage of development/implementation.** Additional cost estimating info is provided in Section 4 and the Appendices.

### Project Next Steps

- Further define preferred decarbonized system and coordinate with utility.
- Further develop decarbonization plan for submittal to Commerce in May 2025.
- Construct test well to validate recommended system approach.

Table 1. In-Building Retrofit ROM Costs.

|     | Building                | Building Area [s.f.] | Renovation Cost [\$] |
|-----|-------------------------|----------------------|----------------------|
| JFK | JFK Library             | 124,496              | \$ 2,900,000         |
| CEB | Computing & Engineering | 98,476               | \$ 4,500,000         |
| MUS | Music Building          | 47,618               | \$ 2,400,000         |
| THE | University Theater      | 41,164               | \$ 1,900,000         |
| ART | Art Building            | 34,469               | \$ 3,100,000         |
| SUT | Sutton Hall             | 31,927               | \$ 900,000           |
| HUS | Huston Hall             | 27,424               | \$ 1,700,000         |
| CMC | Communications Building | 19,289               | \$ 1,100,000         |
| RTV | Radio/TV Building       | 16,980               | \$ 1,100,000         |
|     | <b>Total</b>            |                      | <b>\$ 19,600,000</b> |

## Section 2

# Campus Existing Conditions

---

### Key Takeaways

- The existing steam heating system accounts for 95% of Scope 1 campus carbon emissions and ~70% of Scope 1 and 2 carbon emissions.
- The campus is heating-dominated with spare steam capacity.
- The campus electrical system has significant capacity available to accommodate added loads.

### Campus Energy Use

The EWU campus is served by electricity from the City of Cheney and natural gas from Avista. The central plant provides most of the heating and cooling on campus. Natural gas is consumed at the central utility plant to produce campus steam. Natural gas is also used in a smaller magnitude throughout campus at individual buildings for domestic hot water heating systems, process loads, and for cooking. Campus data below is based on utility bill data and Department of Ecology reporting.

Figure 3: Annual Primary Energy Use

### Campus Energy - Enduse Breakdown

The sankey diagram to the right shows how energy is used across the EWU campus. While there are some disparate fossil fuel (natural gas) uses across campus, the majority of fossil fuel use is attributed to the central steam plant loop. Note this diagram does not include campus vehicles using fossil fuels, as that usage is outside the scope of this project. For the electricity and gas breakouts in this chart, data is based on:

- Natural gas: the breakout between district heat and remaining gas is based on utility data.
- Electricity: the breakout between electricity and district cooling is based on similar campuses. It has been adjusted to account for Cheney’s cooling degree days.

Figure 4: EWU Sankey Diagram of Campus Primary Energy Use

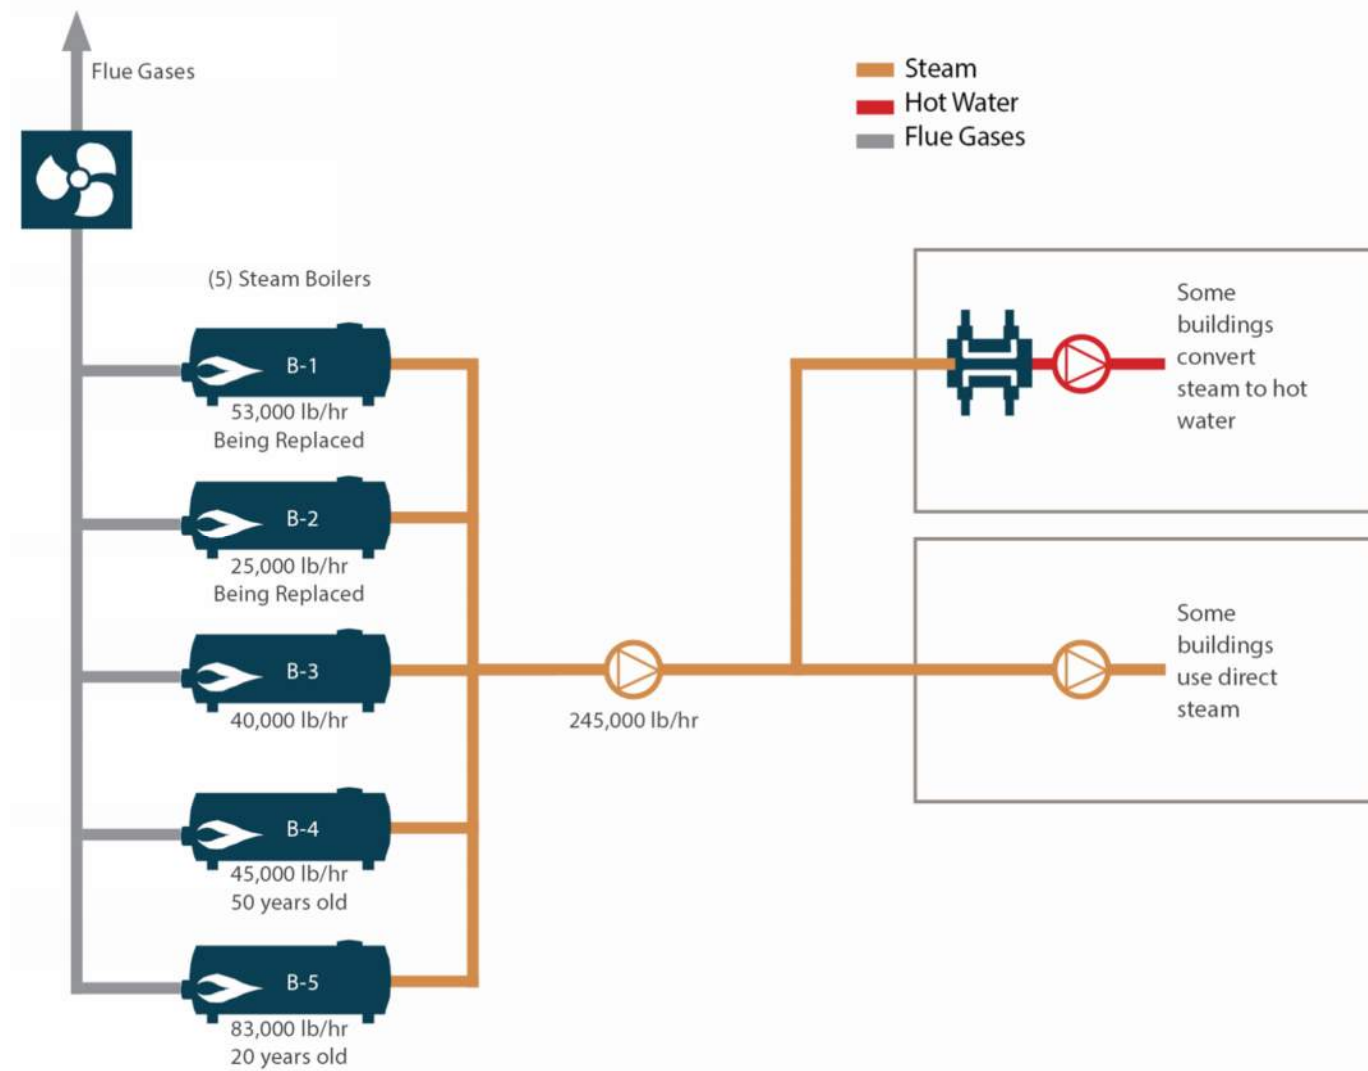

Figure 5: Diagram of Existing Campus Heating System

### Campus Heating

Most of the campus (2.6 million sf) is served by the central steam heating plant at the Central Rozell Energy Plant. This plant consists of five (5) high-pressure steam boilers with a total capacity of 245,000 lb/hr. The boiler ages vary, and boilers 1 and 2 are in the process of being replaced with new gas-fired boilers. The highest observed steam load on campus was approximately 75,000 lb/hr. Steam is distributed to campus via the utilidor system. While some buildings have hydronic heating via steam to hot water converters, many buildings receive heating via direct steam coils. Steam condensate is pumped back to the central plant for collection, at an estimated return rate of 92%.

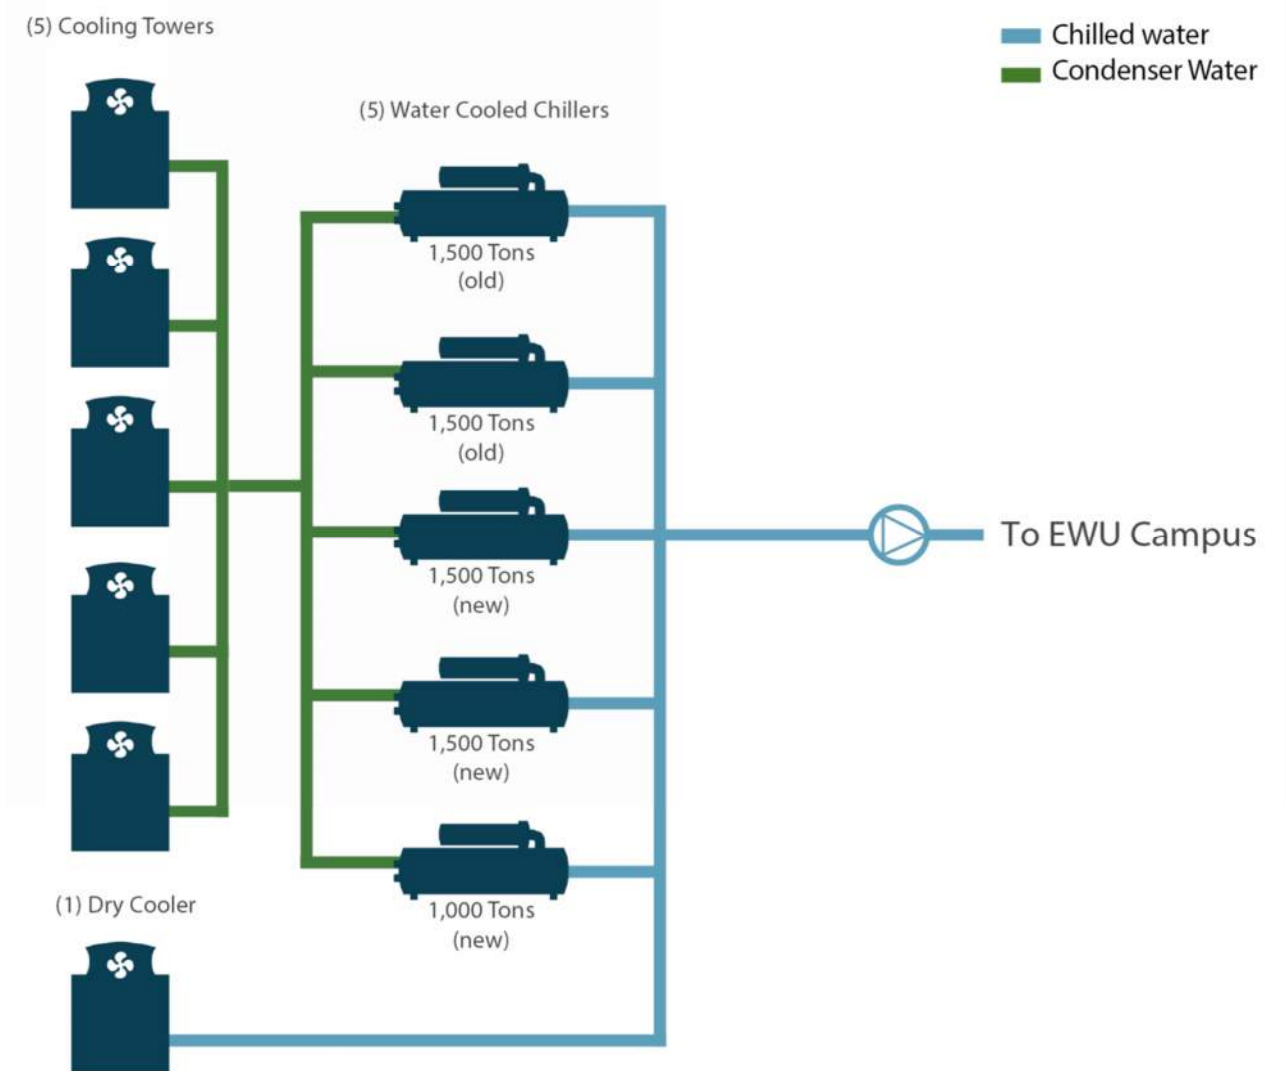

Figure 6: Diagram of Existing Campus Cooling System

### Campus Cooling

Most of the campus (2.1 million sf) is served by the central chilled water system at the Central Rozell Energy Plant. Residence halls are the main exception, as most do not have cooling. This plant consists of five (5) water-cooled chillers and open draw-thru cooling towers for a total capacity of 7,000 tons. The chiller plant is in the process of several modernization and energy upgrades, including water-side economizers and variable speed chillers and pumps. The chillers are turned off October thru April, and winter cooling is provided by a separate dry-cooler unit, with glycol anti-freeze protection. The connected buildings do not have heat exchangers for isolation, and chilled water is typically fed directly into the building's HVAC systems.

Summary of Campus Electrical Infrastructure

The existing campus electrical infrastructure at Eastern Washington University is powered via two service entrance points from two different City of Cheney Substations. Each service consists of a 600A, 13.2kV metal enclosed switchgear . The first service is located at Red Barn and powered from the Turnbull Substation. The second is located at Rozell and powered from the 4 Lakes Substation. Each of the two services feeds either of the two busses within a double-ended 1200A 13.2kV switchgear. This switchgear provides distribution to the remainder of the campus. In addition to powering this switchgear, the Rozell services also provides a 4000KVA feeder to the Rozell Chiller Plant.

Each service has the capacity to deliver up to 13.7MVA to the campus, for a total combined capacity of 27.4 MVA. Utility metering data was reviewed over the course of the year from May 2023 to April 2024 and the peak electrical demand was observed for both services. These values helped to determine the existing utilization of each of the electrical services. Significant capacity exists on both services to accommodate additional electrical load, and the campus loop is designed to allow for physical expansion on either end of the service switchgear busses. Further study will be conducted to calculate the total added electrical load from decarbonization, and will determine if the existing campus infrastructure is sufficiently sized to accommodate the new load

Figure 7: Red Barn and Rozell Plant Capacity Analyses

## Section 3

# Decarbonization Solution – Energy Plant

---

### Key Takeaways

- The preferred system is an open-loop geothermal system with nodal plants.
- A wide variety of heat sources and sinks were considered, and a qualitative comparison was performed for three options to determine the preferred option.
- The added electrical load to the campus infrastructure has not yet been evaluated. This will be analyzed later in this project.

# Decarbonization Solution | System Scoring Summary

## System Scoring Summary

As described in the following pages, several system options were considered for heat sources/sinks and plant configuration. For each system component, the options analysis answered the following key questions:

**Heat Sources and Sinks:** How will EWU generate heating and cooling?

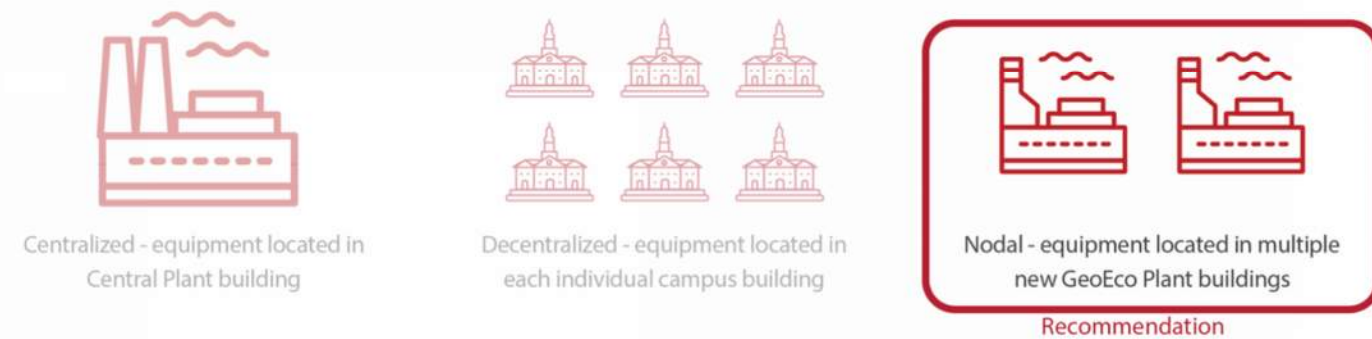

**Plant Configuration:** Will the decarbonized system have a central location, or will it be dispersed across campus?

Based on this exercise, and with the approval of EWU, the preferred system is a nodal open-loop geothermal system.

### Heat Sources & Sinks

### Plant Configuration

## System Scoring Criteria

Table 2 presents the scoring criteria and weightings used to determine the preferred system. These criteria were developed with EWU Construction, Planning, and Facilities groups input and considers the University's priorities and preferences.

Table 2: Relative Weights for Scoring Criteria

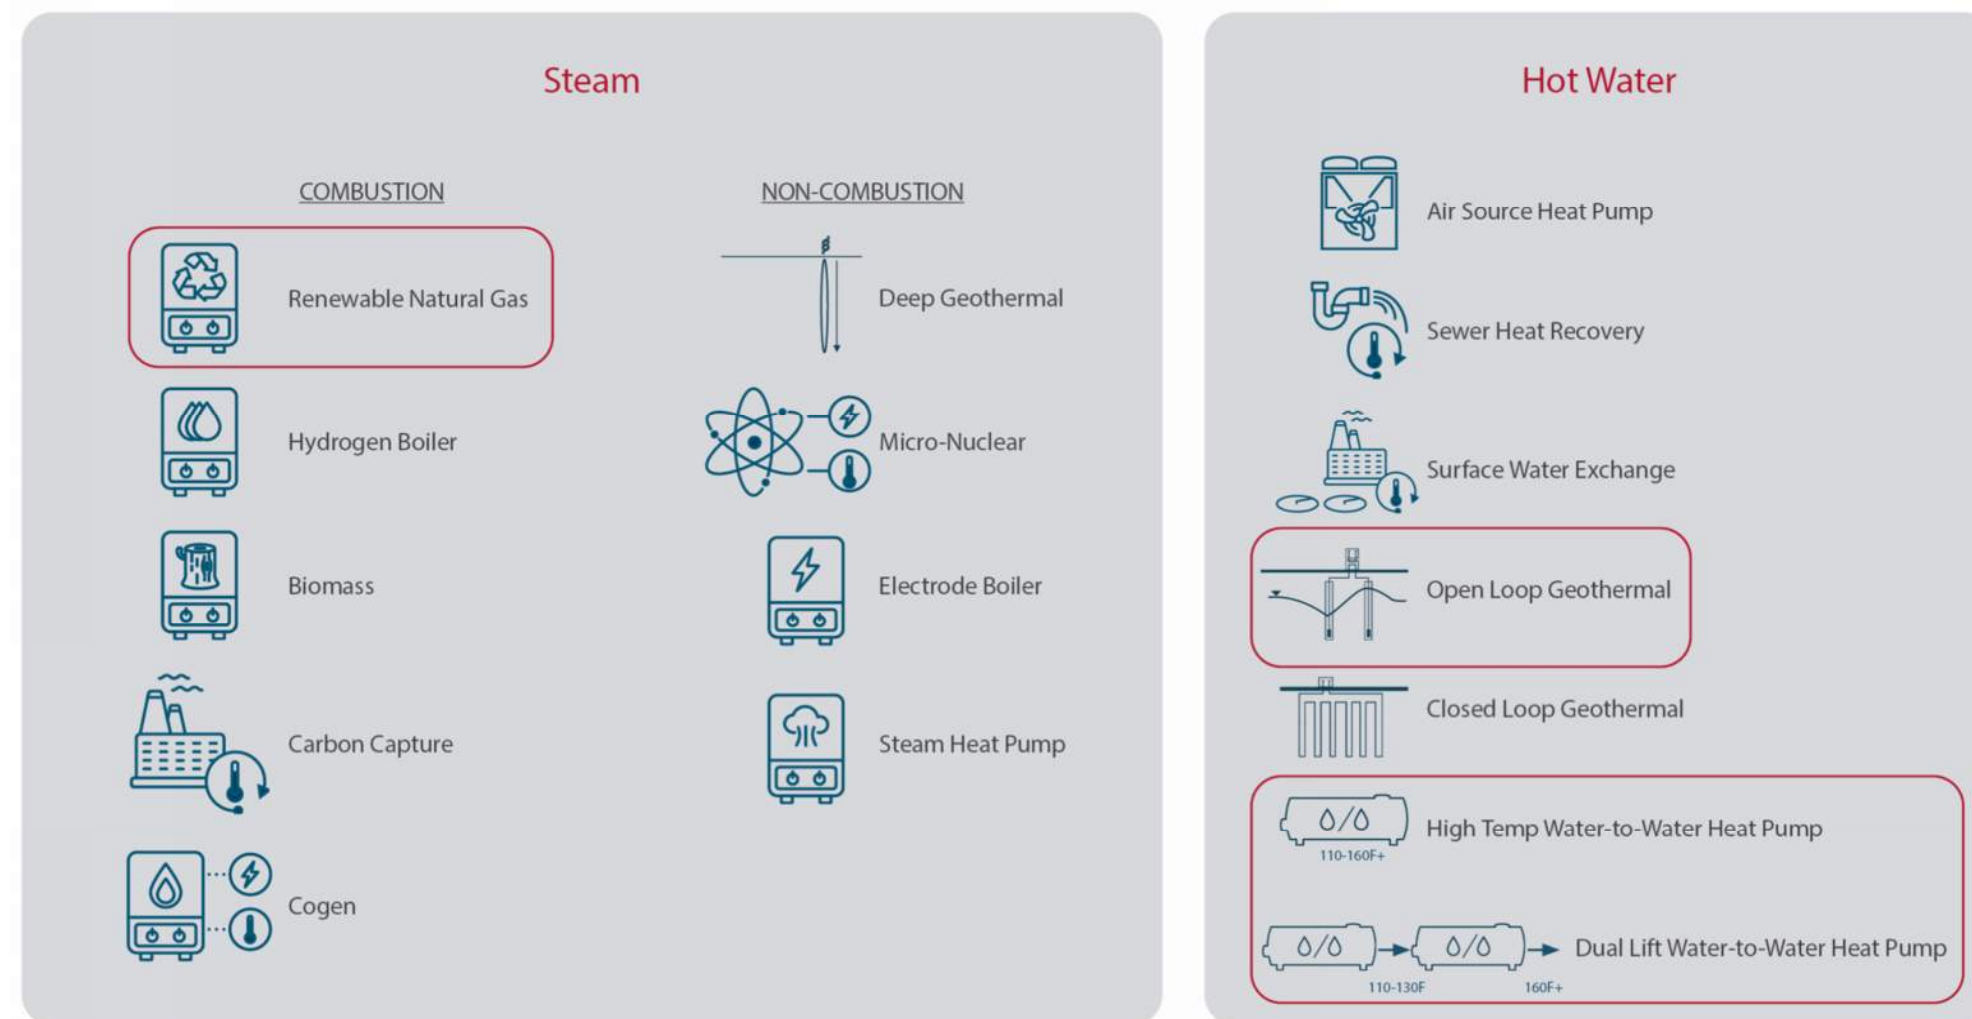

| Scoring Variable                  | Weighting |
|-----------------------------------|-----------|
| First Cost                        | 30%       |
| Utility Cost                      | 20%       |
| Maintenance Cost                  | 20%       |
| Carbon Cost Effectiveness         | 10%       |
| Teaching / Curriculum Opportunity | 20%       |

## System Considerations

Heating is currently provided by fossil fuel-fired steam boilers, which are a prime source of scope 1 carbon emissions. Transitioning that fossil fuel-based system to one not requiring natural gas is a primary piece in driving decarbonization on campus. Since EWU receives electricity from a utility that is powered predominantly by hydropower, transitioning the gas-based system to an electrified system is a key strategy for decarbonization. The system options list below summarizes the systems considered for electrification of the EWU heating system. Qualitative scoring for three options is included on the next page, followed by a complete list of options with further context. **Based on this analysis, open-loop geothermal is the preferred electrified system. Note: this recommendation must be validated by favorable results from a geothermal test well.**

## System Options

Systems that would maintain the steam distribution system, as well as those that would transition heating from steam to hot water were considered. In addition, the temperature of the hot water was considered, as different technologies have different capabilities. Based on guidance from EWU, the systems in red boxes in the figure below were compared qualitatively, as shown on the next page.

### Low Temperature vs High Temperature Hot Water

When switching from steam to hot water the temperature of that water is a critical consideration. Many of EWU's buildings currently have mechanical systems with direct steam heating. These buildings will require more invasive mechanical system retrofits to switch from steam to hot water. The retrofitted hot water system should be low temperature. Other scenarios will need to be considered on a case-by-case basis. The first nine buildings for conversion are described in the next section of this report.

#### Low Temperature Hot Water (LTHW)

- Least amount of mechanical plant equipment needed.
- Some existing hot water systems may be able to operate on lower temperatures, requiring minimal in-building upgrade. For those that can't, and for existing steam systems, LTHW may require significant in-building retrofits.
- Mandated for new construction buildings in Washington State.

#### High Temperature Hot Water (HTHW)

- Requires either two-stage heating systems (with two pieces of equipment), or high temperature heat pumps, which are an emerging technology.
- Does not usually require invasive retrofits to existing in-building mechanical systems.
- Of the buildings that currently have hot water, most operate with HTHW.

## Decarbonization Solution | Heat Sources & Sinks Scoring

The heat source/sink analysis compared the relative merits of three systems qualitatively and scored them against performance criteria identified in collaboration with EWU stakeholders. Table 3 presents the results of the scoring analysis.

Table 3: Relative Scoring of Decarbonization Strategies

| Geo + Low Temperature Hot Water (LTHW)   | Geo + High Temperature Hot Water (HTHW)  | Steam via Renewable Natural Gas   |
|--|--|---|
| <b>Recommendation</b>  |  |   |
| While low temperature hot water is the best-scoring option, most likely the solution will use a mix of low temperature and high temperature hot water, depending on existing building systems. A low temperature hot water system depends on the operating conditions of in-building heating systems, as some buildings may need extensive retrofit to accommodate a low temperature heating system. |  |   |
| <b>Description</b>   |  |   |
| Open loop geothermal with water-to-water heat pumps providing 110-130F hot water.  | Open loop geothermal with water-to-water heat pump(s) providing 160F+ hot water. Bringing hot water up to high temperatures may be achievable with a single heat pump or may require two heat pumps in a dual-lift configuration.  | Renewable natural gas (RNG) boilers to provide steam to existing systems.<br><br>As it is currently written, HB 1390 only allows for 10% of annual heating to be provided by gas or electric resistance. Commerce has not yet provided guidance on alternative fuels.   |
| <b>First Cost</b>  |  |   |
| \$\$\$\$   | \$\$\$\$   | \$  |
| <b>Utility Cost</b>  |  |   |
| \$   | \$   | \$\$\$\$\$  |
| <b>Maintenance Cost</b>  |  |   |
| \$\$\$   | \$\$\$\$   | \$\$\$\$\$  |
| <b>Carbon Cost Effectiveness</b>   |  |   |
| High   | Medium   | Low   |
| <b>Teaching / Curriculum Opportunity</b>   |  |   |
| High   | High   | Low   |
| <b>Overall Score</b>   |  |   |
| <b>3.70</b>  | <b>3.10</b>  | <b>2.20</b>   |
| <b>Advantages</b>  |  |   |
| <ul style="list-style-type: none"> <li>- More efficient</li> <li>- Less electrical load</li> <li>- Fewer pieces of equipment</li> <li>- Provides cooling and heat recovery</li> </ul>  | <ul style="list-style-type: none"> <li>- Fewer pieces of equipment</li> <li>- Avoids potentially expensive in-building retrofits</li> <li>- Provides cooling and heat recovery</li> </ul>  | <ul style="list-style-type: none"> <li>- Familiar Technology</li> <li>- Avoids potentially expensive in-building retrofits</li> </ul>   |
| <b>Disadvantages</b>   |  |   |
| <ul style="list-style-type: none"> <li>- Will require some substantial/significant building retrofits to convert to LTHW</li> <li>- Assuming new pipes can't fit in existing tunnel, will require sitework to install new distribution piping.</li> </ul>  | <ul style="list-style-type: none"> <li>- High temperature heat pumps are an emerging technology</li> <li>- Higher equipment first cost</li> <li>- Higher O&amp;M costs</li> <li>- Dual-lift systems would need additional space</li> <li>- Assuming new pipes can't fit in existing tunnel, will require sitework to install new distribution piping.</li> </ul> | <ul style="list-style-type: none"> <li>- Current RNG price 5 to 7 times higher than natural gas. Price needs to come down significantly.</li> <li>- RNG supply is not currently mature. System is reliant on utility's ability to provide sufficient RNG.</li> <li>- Boiler System is a heating-only solution that offers no benefit to the central chilled systems. Does not allow for heat recovery.</li> <li>- High maintenance costs in the plant, distribution piping, and in-building systems.</li> </ul> |

## Decarbonization Solution | Heat Sources & Sinks Technology Options

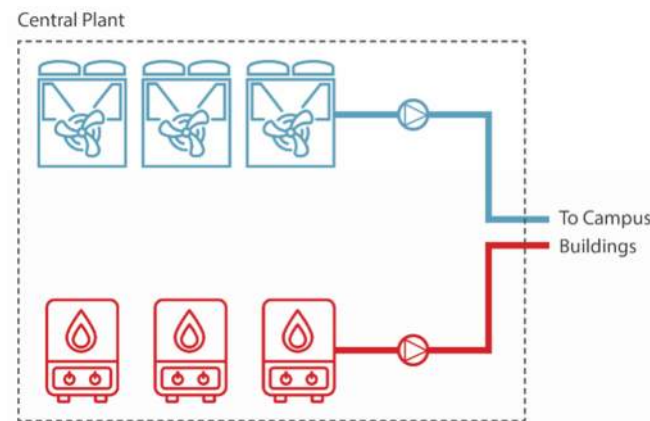

Heat can be introduced to the campus from a wide variety of possible sources via a wide variety of technology. Table 4 presents the options considered for the EWU campus and considerations for their applicability.

Table 4: Heating Technology Options

|           |                | Concept  | Heating? | Cooling? | Suggested Action                     | Notes   |
|-----------|----------------|--|----------|----------|--------------------------------------|---|
| Steam     | Combustion     | Renewable Natural Gas Boilers                            | Yes      | No       | Evaluate Qualitatively               | Currently utility RNG market is not mature in local market. With HB 1589 passed, gas utilities may evolve in the near future. Limitation of current options puts resiliency at risk. Additionally, HB 1390 has not ruled on validity of alternative fuels that use combustion. Gasification of biomass is possible, but will be space intensive and have similar challenges as biomass boilers.   |
|           |                | Biomass Boilers  | Yes      | No       | Fast Fail                            | Requires consistent supply, is labor-intensive, and requires large footprint for boiler feed. There is also debate as to whether biomass is carbon-free. Additionally, HB 1390 has not ruled on validity of alternative fuels that use combustion.  |
|           |                | Hydrogen Boilers   | Yes      | No       | Fast Fail - Not At Scale Yet         | Provides resiliency through hydrogen storage, but is not commercially viable at scale yet. CU Boulder is currently undertaking a pilot program for research purposes. Additionally, HB1390 has not ruled on validity of alternative fuels that use combustion.  |
|           |                | Cogeneration Boilers                                     | Yes      | No       | Fast Fail                            | Provides campus resiliency through on-site power generation, and also reduces electrical load on City Utility. Burns fossil fuels to create heating, so cannot be used for HB 1390 compliance   |
|           |                | Carbon Capture   | Yes      | No       | Pilot Project Underway               | EWU was recently awarded grant funding to design and construct a carbon capture system for the existing fossil fuel-based steam boilers.  |
|           | Non-Combustion | Deep Geothermal  | Yes      | No       | Fast Fail                            | Deep geothermal is possibly feasible, but requires further study and would most likely have a large first cost. It is currently more suited for utility scale.  |
|           |                | Micro-Nuclear  | Yes      | No       | Fast Fail                            | Microreactors (5-10 MW) are currently in early stage of design/development. Won't be available until late 2020's/early 2030's at the earliest   |
|           |                | Electrode Boiler   | Yes      | No       | Fast Fail - Not Allowed by 1390      | Can only contribute 10% of annual heat input per HB 1390 requirements, not a solution on its own. Likely improves overall plant heating efficiency ~15-20%. EWU already evaluated this (before 1390) and found it too expensive.  |
| Hot Water | High Temp      | Heat Exchange Source + High Temp Heat Pump (Single Lift) | Yes      | Yes      | Evaluate Qualitatively               | High-temperature heat pumps are a quickly emerging technology. While typically used for industrial applications, manufacturers are quickly providing new models with better performance for higher education applications.  |
|           |                | Low Temp HW (LTHW) + Secondary Heat Pump (Dual Lift)     | Yes      | Yes      |                                      | 1st step heating can be any LTHW concept (e.g. geothermal). 2nd step heat from LTHW to HTHW achieved via water-to-water heat pumps (WWHP) in each building or at certain nodes. In-building WWHPs limited by available mech room space and electrical capacity.   |
|           |                | Steam Heat Pump (Single Lift)                            | Yes      | No       | Future Consideration                 | Similar to High Temp heat pump, these are being seen first in industrial applications and emerging quickly. Development for commercial applications is slightly lagging behind high temp heat pumps.  |
|           |                | Low Temp HW + In-Building Elec Boiler (Dual Lift)        | Yes      | No       | Future Consideration                 | In-building electric heating is not limited by HB 1390. 1st step heating can be any LTHW concept (e.g. geothermal). 2nd step heat from LTHW to HTHW achieved via electric boiler/heating in each building or at certain nodes. In-building electric heating limited by available mech room space and electrical capacity. Electric boilers are significantly less efficient than WWHPs and aren't ideal for two-step controllability. Could be considered in future phase if mechanical room space becomes a limiting factor for the WWHP option. |
|           | Low Temp       | Open Loop Geo-Exchange                                   | Yes      | Yes      | Evaluate Qualitatively               | EWU conducted a geothermal evaluation with system options, which found the aquifer beneath campus could have capacity to meet campus heating/cooling needs. The findings of the evaluation are based on computer modeling and available data, and need to be validated via geothermal test well.  |
|           |                | Closed Loop Geo-Exchange                                 | Yes      | Yes      | Fast Fail - Open Loop is More Viable | More costly per unit capacity than open loop and requires significantly more site area. Viable option for sites that don't have a viable open loop aquifer.   |
|           |                | Air-to-Water Heat Pump                                   | Yes      | Yes      | Future Consideration                 | Could be included for peaking heating/cooling loads in campus system, depending on aquifer viability and total system cost. Viable option for standalone buildings not connected to campus system.  |
|           |                | Surface Water Exchange                                   | No       | Yes      | Fast Fail                            | EWU campus is not directly adjacent to a significant body of water.   |
|           |                | Campus Sewer Heat Recovery                               | Yes      | Yes      | Fast Fail                            | Campus sewer line would have insufficient flow to make a meaningful impact. Makes more sense for sites that are near very large citywide sewer lines. Otherwise, the added maintenance and cost are not worth the energy recovered.   |

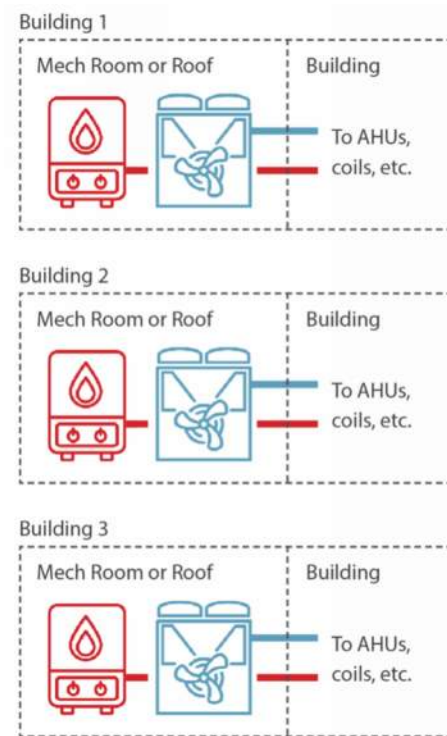

## Decarbonization Solution | Plant Configuration Options

The plant configuration dictates where the heating/cooling equipment is located and the general quantity of pieces of equipment. The existing heating/cooling system is centralized, with all the main equipment located in the Rozell Energy Plant. The main tradeoffs between a centralized plant and several smaller distributed plants include maintenance, phasing, and space requirements. **The nodal system is preferred, largely due to its flexibility and phase-ability, as well as the opportunity to showcase decarbonization to the campus.**

### Centralized

A centralized system houses all heating and cooling equipment in a single location. This allows for larger equipment with less maintenance but is not ideal for phasing and flexibility.

### Decentralized

A decentralized system houses all heating and cooling equipment in individual buildings. All buildings are independent of a central loop and mechanical equipment is standalone. In essence, the existing central heating/cooling loop would be abandoned. While this reduces overall pumping energy, it also significantly increases maintenance costs. It is also difficult from a constructability perspective since existing buildings don't typically have extra space or electrical capacity for large new equipment. This approach is also challenging to integrate with geothermal as it is impractical for each building to have its own wells.

### Nodal

A nodal system houses all heating and cooling equipment in several smaller distributed plant buildings, meaning new plant buildings would be built across campus. This approach is a blend of centralized and decentralized, and each plant building would house mid-size mechanical equipment.

## Decarbonization Solution | Plant Configuration Scoring

The plant configuration analysis compared three options for the distribution of central plant equipment and distribution of thermal energy across the campus. These options were scored against performance criteria identified in collaboration with EWU stakeholders, and the results are shown in Table 5.

Table 5: Relative Scoring for Plant Distribution Strategies

| Centralized   | Decentralized  | Nodal  |
|---|--|--|
| <b>Recommendation</b>   |  |  |
| <b>The nodal configuration is recommended as it has many of the benefits of the centralized system while being flexible and well-suited to phasing.</b>   |  |  |
| <b>Description</b>  |  |  |
| This option is most similar to the existing central plant configuration, with all major mechanical equipment located in one central location.   | This option would employ major pieces of mechanical equipment (i.e. water-to-water heat pumps, air-source heat pumps) at each building to produce heating and cooling at the building level.   | This option would utilize multiple "nodal" plants, each with major mechanical equipment, spread across campus.   |
| <b>First Cost</b>   |  |  |
| \$\$  | \$\$\$\$   | \$\$\$   |
| <b>Utility Cost</b>   |  |  |
| \$  | \$\$   | \$   |
| <b>Maintenance Cost</b>   |  |  |
| \$  | \$\$\$\$   | \$\$   |
| <b>Carbon Cost Effectiveness</b>  |  |  |
| High  | Medium   | High   |
| <b>Teaching / Curriculum Opportunity</b>  |  |  |
| Medium  | Low  | High   |
| <b>Overall Score</b>  |  |  |
| <b>4.10</b>   | <b>2.00</b>  | <b>4.20</b>  |
| <b>Advantages</b>   |  |  |
| <ul style="list-style-type: none"> <li>- Fewer pieces of major mechanical equipment mean less maintenance</li> <li>- Fewer wells</li> <li>- Reduced well maintenance</li> <li>- Reduced infrastructure costs</li> <li>- Doesn't require new buildings across campus</li> </ul>  | <ul style="list-style-type: none"> <li>- Doesn't require new or modified distribution piping</li> <li>- Buildings can be built and operated independently of each other</li> <li>- No new dedicated building for plant equipment needed</li> </ul>   | <ul style="list-style-type: none"> <li>- Better for phasing than central plant</li> <li>- Flexible to evolving campus plans</li> <li>- Lower conveyance piping costs for geothermal</li> <li>- Lower likelihood of overdesigning wellfields</li> <li>- Provides opportunity to showcase decarbonization</li> </ul> |
| <b>Disadvantages</b>  |  |  |
| <ul style="list-style-type: none"> <li>- Higher conveyance piping costs for geothermal</li> <li>- Fewer pieces of equipment mean less redundancy/resiliency</li> <li>- Harder to phase, resulting in larger capital requests</li> <li>- New hot water distribution piping across campus has high campus impact</li> </ul> | <ul style="list-style-type: none"> <li>- Higher O&amp;M costs from increased quantity of equipment</li> <li>- Reduced Space/roof area in buildings to fit mechanical equipment</li> <li>- Most likely requires substantial electrical upgrades at most buildings</li> <li>- Abandons existing infrastructure</li> <li>- No heat sharing</li> </ul> | <ul style="list-style-type: none"> <li>- More maintenance than central system</li> <li>- Requires small new plant buildings and new hot water distribution piping</li> </ul>   |

## Section 4

# Decarbonization Solution – Building Conversions

### Key Takeaways

- The nine buildings were scoped for decarbonized space heating and water heating based on their existing systems.
- No electrical service upgrades are required at any of the nine buildings.
- The total ROM cost to convert these nine buildings so they can connect to the first geothermal node is ~\$20,000,000.

**Building Renovations**

Achieving decarbonization at EWU hinges on ensuring that the existing buildings can utilize thermal energy from the proposed nodal geothermal plants. Sharing thermal energy is the defining feature of any district energy system. This study has scoped decarbonization renovations to connect nine buildings to the first nodal plant. The district connection is intended to allow the sharing of thermal energy for both space heating and domestic water heating systems. The proposed renovations also dovetail with a variety of efficiency improvements that are outlined in the Energy Upgrades ROM Pricing Report and included in the 2025-2027 capital request. Improving the functionality, efficiency, and control of any system will improve the overall performance of the district. The exact implementation of building renovations is dependent on the funding received. Figure 8 below shows the nine buildings considered for connection to the first nodal central plant. The specific renovations required are discussed in the following pages.

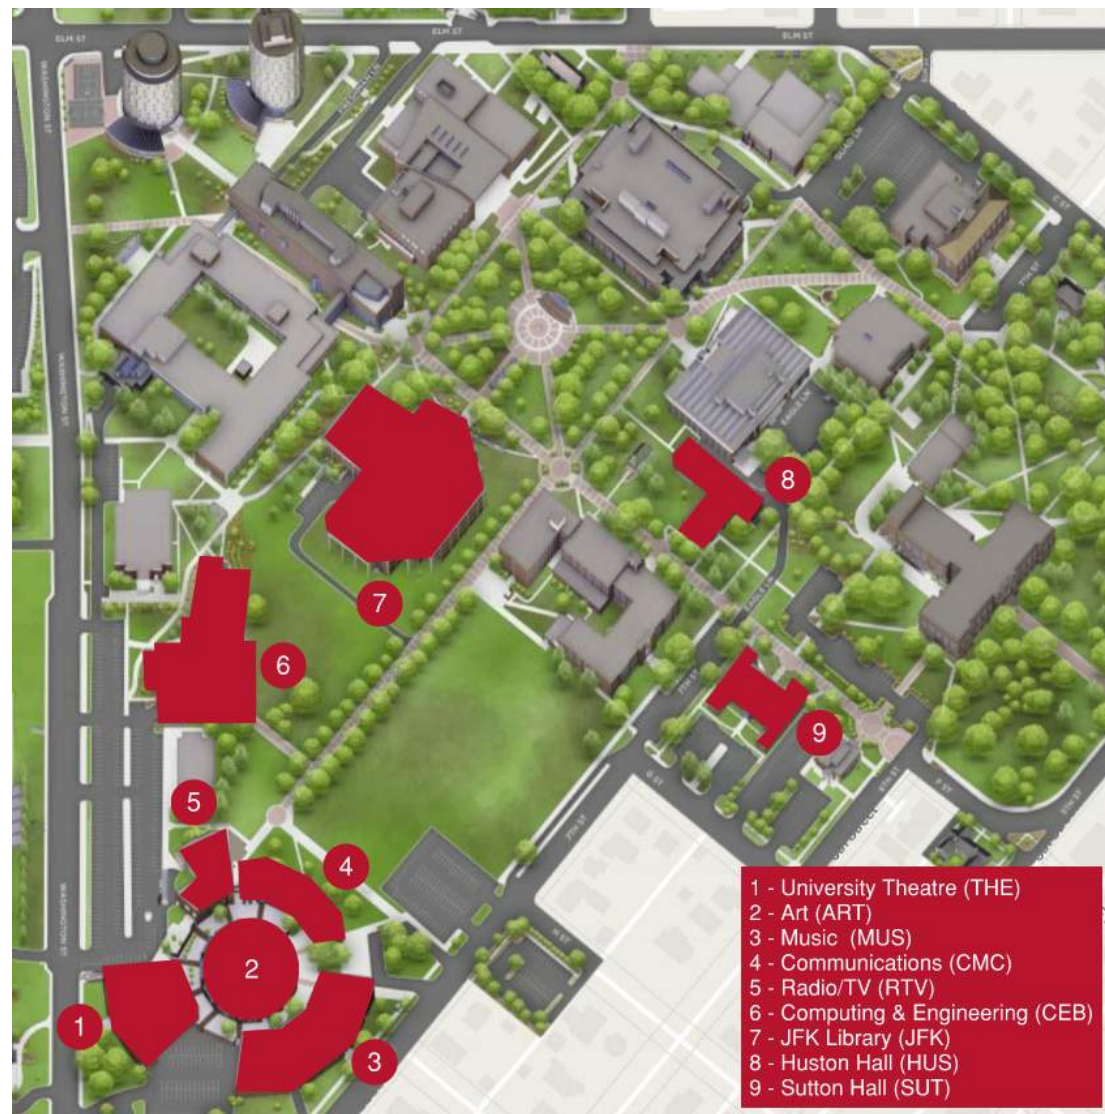

Figure 8: Buildings Studied for District Interconnection

**Mechanical Decarbonization Strategies**

Table 6 and Table 7 below describe the recommended strategies for decarbonizing the space heating and DHW systems. The proposed in-building solutions assume low temperature hot water (LTHW) is provided to the buildings at approximately 120°F. The appendices include detailed descriptions of the existing systems in each building.

Table 6: Space Heating Decarbonization Strategies

| Decarbonization Strategy   | Existing Mechanical System   | Proposed Mechanical System   | Applies To  |
|--|--|--|---|
| HHW Strategy 1<br><b>High Temp Hot Water (HTHW) Double Lift</b>      | Many heating coils served by HTHW.                                       | Add in-building water-to-water heat pump to boost district energy LTHW supply up to 180°F to serve existing coils. No coil replacement.                                | JFK - Kennedy Library<br>SUT - Sutton Hall  |
| HHW Strategy 2<br><b>Coil Replacement</b>                            | Relatively few heating coils. All coils are either direct steam OR HTHW. | Replace coils and piping with LTHW. Replace existing fans with new fan walls.  | CEB - Computer & Engineering<br>CMC - Communications<br>HUS - Huston Hall<br>MUS - Music Building<br>RTV - Radio & TV |
| HHW Strategy 3 -<br><b>Hybrid Coil Replacement &amp; Double Lift</b> | Direct steam heating coils AND HTHW coils.                               | Replace steam coils with LTHW piping and coils. Add in-building water-to-water heat pump to boost district energy LTHW supply up to 180°F to serve existing HTHW coils | ART - Art Building<br>THE - Theater   |

Table 7: Domestic Hot Water Decarbonization Strategies

| Decarbonization Strategy                              | Strategy Description  | Applies To   |
|---|---|--|
| DHW Strategy 1<br><b>Existing Electric DHW Heater</b> | Maintain existing electric DHW heater(s), tanks(s) and infrastructure.  | CMC - Communications<br>MUS - Music Building<br>RTV - Radio & TV<br>SUT - Sutton Hall<br>THE - Theater |
| DHW Strategy 2<br><b>DHW Double Lift Heat Pump</b>    | Add an in-building DHW heat pump and storage tank to use district energy LTHW and maintain DHW @ 140°F. Existing steam converter to be left in place for optional backup. | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>ART - Art Building       |

**Building Decarbonization Strategy 1**

**Mechanical**

Strategy 1 will add an in-building water-to-water heat pump to boost district energy LTHW and supply up to 180°F to serve the existing coils. All existing coils will remain, which will limit the scope of work to the main mechanical room near the existing steam converter. The existing steam converter will be left in place for backup to allow for sizing the booster WWHP for 60-80% of the true building peak load, saving cost, while still delivering ~90-95% of annual building heat. The hot water reset schedule should be optimized to maintain the lowest temperature HW necessary to provide heat to the building.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 1 is applicable for buildings without steam, where there exists a large quantity of hot water coils requiring High Temperature Hot Water. The Kennedy Library (JFK) is shown in Figure 9, but this strategy can also be applied to Sutton Hall (SUT) which has similar systems.

**Additional Considerations**

Further study of the actual building loads will impact how this strategy is implemented. The continued use of steam provides flexibility and resiliency while decarbonized systems are implemented and commissioned. In some cases, it may be possible to decommission the steam system once the decarbonized system is operational and demonstrates the ability to meet the building loads. Depending on the timeline for implementation, new technologies in high-temperature heat pumps may reduce cost and

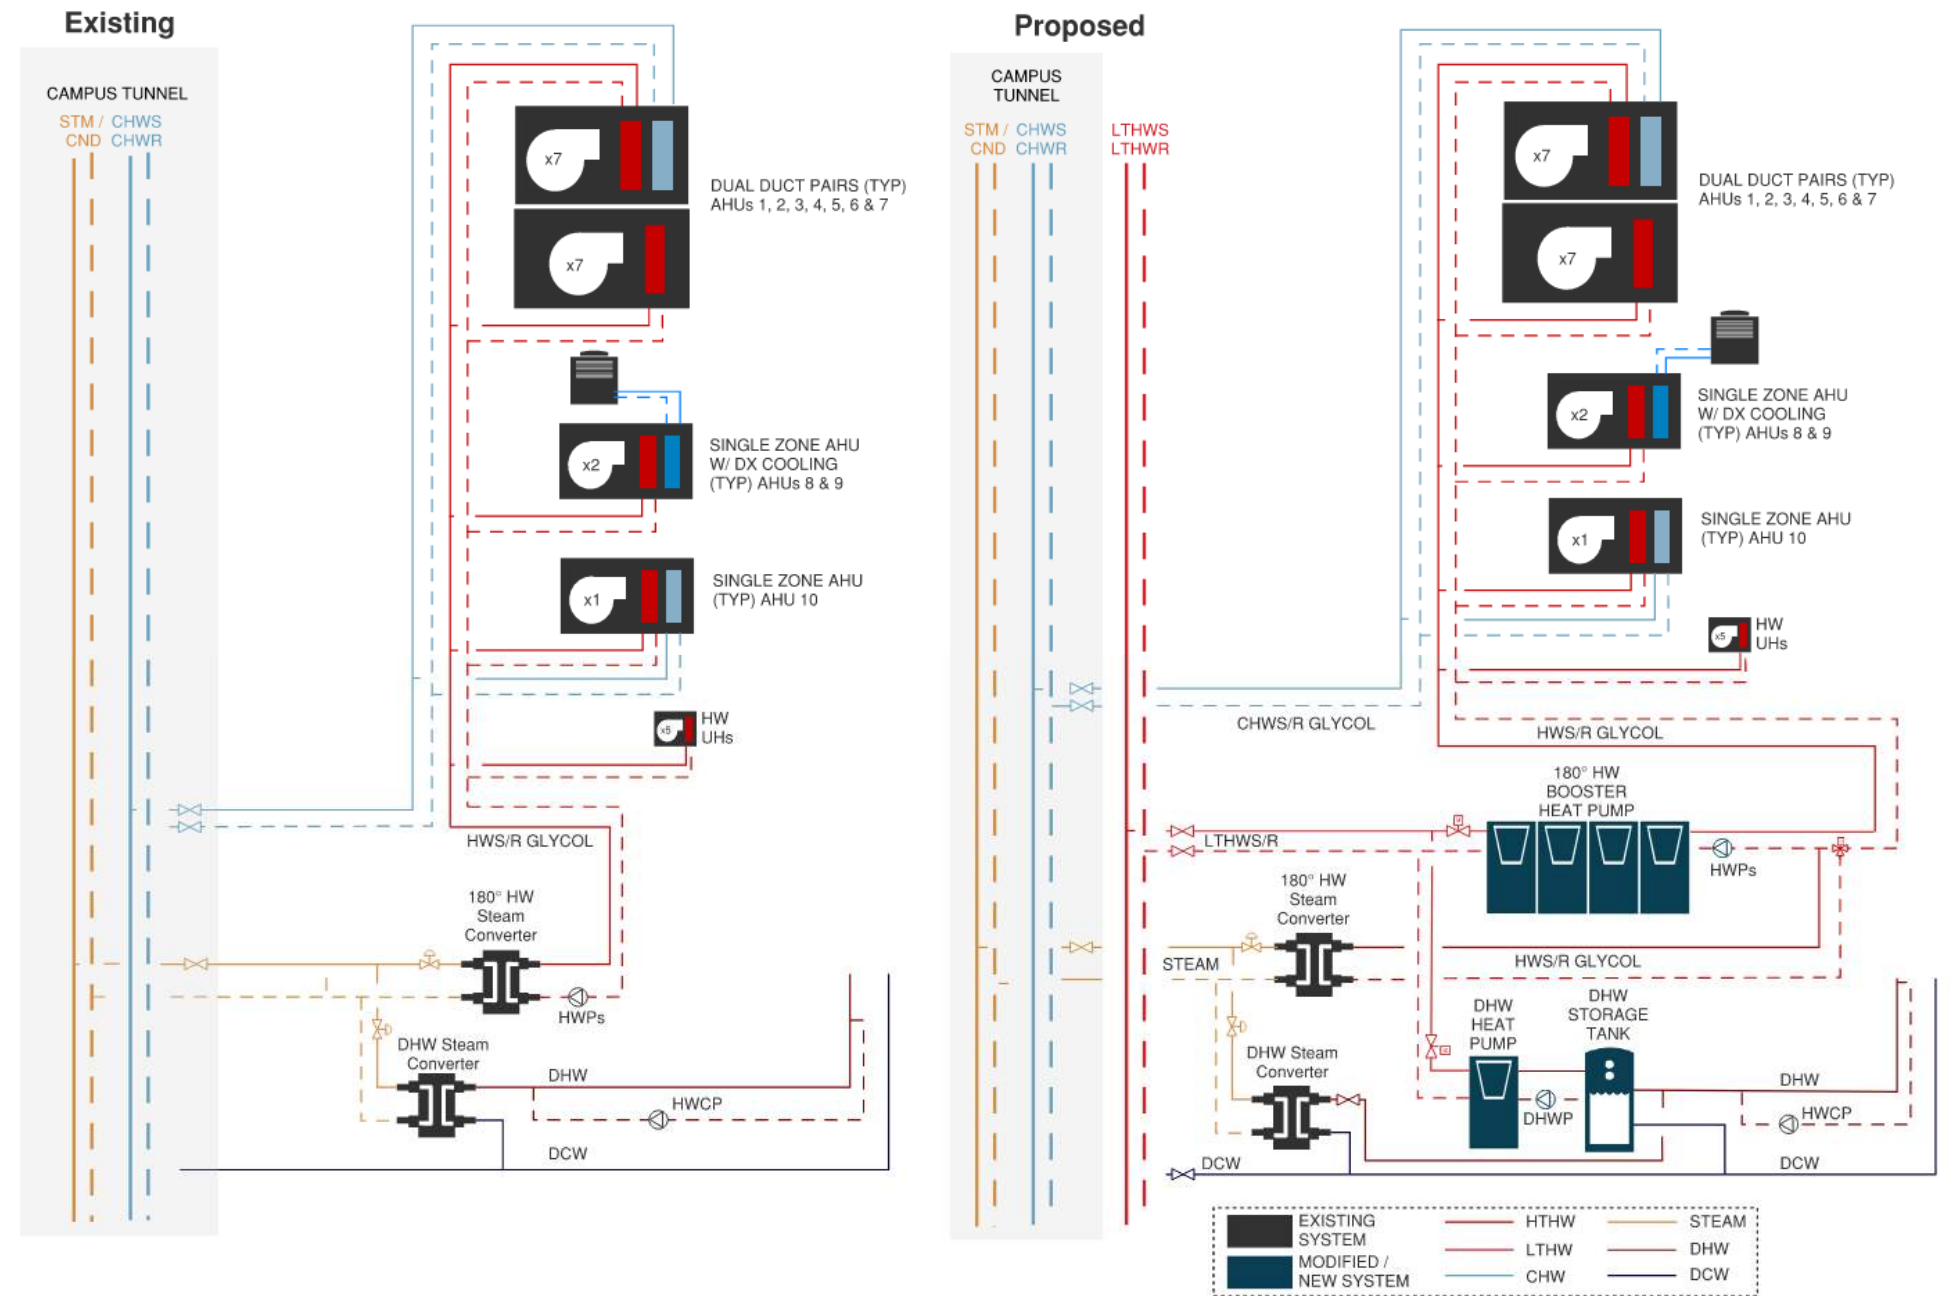

Figure 9: Strategy 1 Mechanical Diagrams

**Building Decarbonization Strategy 2**

**Mechanical**

Strategy 2 will replace all steam coils and piping with low temperature hot water (LTHW) coils and piping to utilize district energy LTHW. A new heat exchanger will be necessary to isolate building LTHW loop from district LTHW loop and allow for glycol freeze protection in the building loop. To allow both space and capacity for new LTHW coils, the fans will need to be replaced with new fan walls.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters utilizes for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 2 applies to buildings that have steam heating and limited or no terminal systems with coils. These systems are ideally suited to change out steam coils and piping and serve with district energy LTHW. The Computer & Engineering Building (CEB) is shown in the diagram below, but this strategy can also be applied to Communications (CMC), Huston Hall (HUS), Music (MUS) and the Radio & TV Building (RTV), which have similar systems.

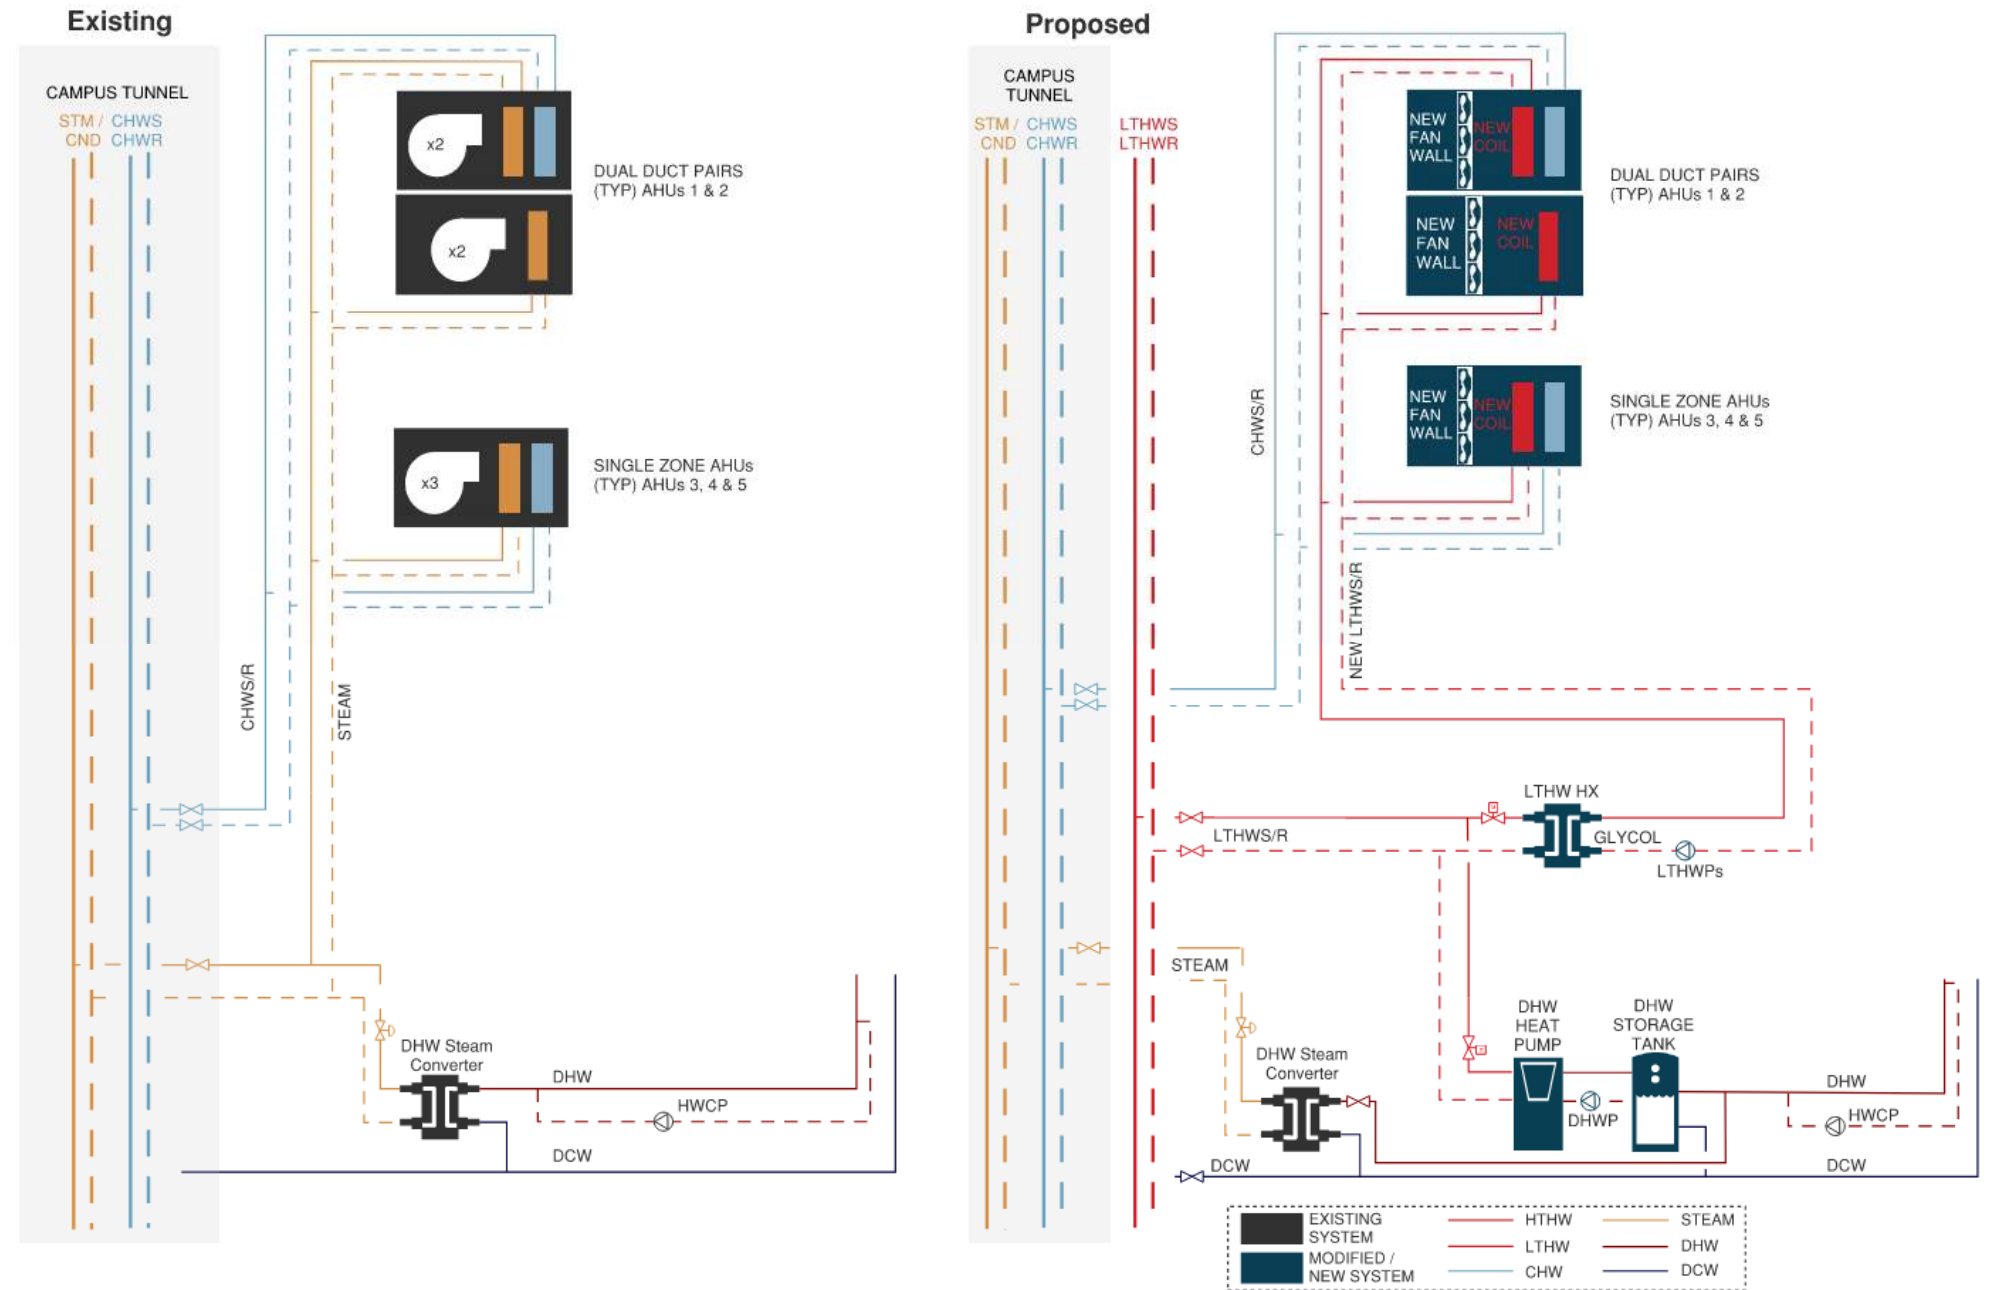

Figure 10: Strategy 2 Mechanical Diagrams

**Building Decarbonization Strategy 3**

**Mechanical**

Strategy 3 will replace large steam coils in air handlers with low temperature hot water (LTHW) coils to utilize district energy LTHW. To allow both space and capacity for new LTHW coils, the air handler fans will need to be replaced with new fan walls. A new heat exchanger will be necessary to isolate the building LTHW loop from the district LTHW loop and allow for glycol freeze protection in the building loop.

Terminal heating systems will be served by a new in-building water-to-water heat pump to boost district energy LTHW up to 180°F HW. The hot water reset schedule should be optimized to maintain the lowest temperature HW necessary to provide heat to the building. The existing steam converter to be left in place as back up to allow for sizing the booster WWHP for 60-80% of the true building peak load, saving cost, while still delivering ~90-95% of annual building heat.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters utilizes for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 3 applies to buildings that have steam heating and hot water terminal heating. These systems are ideally suited to change out steam coils and serve directly with district energy LTHW but will also require an in-building heat pump to maintain the terminal heating hot water loop temperature up to 180°F. The Art Building (ART) is shown in the diagram below, but this strategy can also be applied to the Theater Building (THE), which has similar systems.

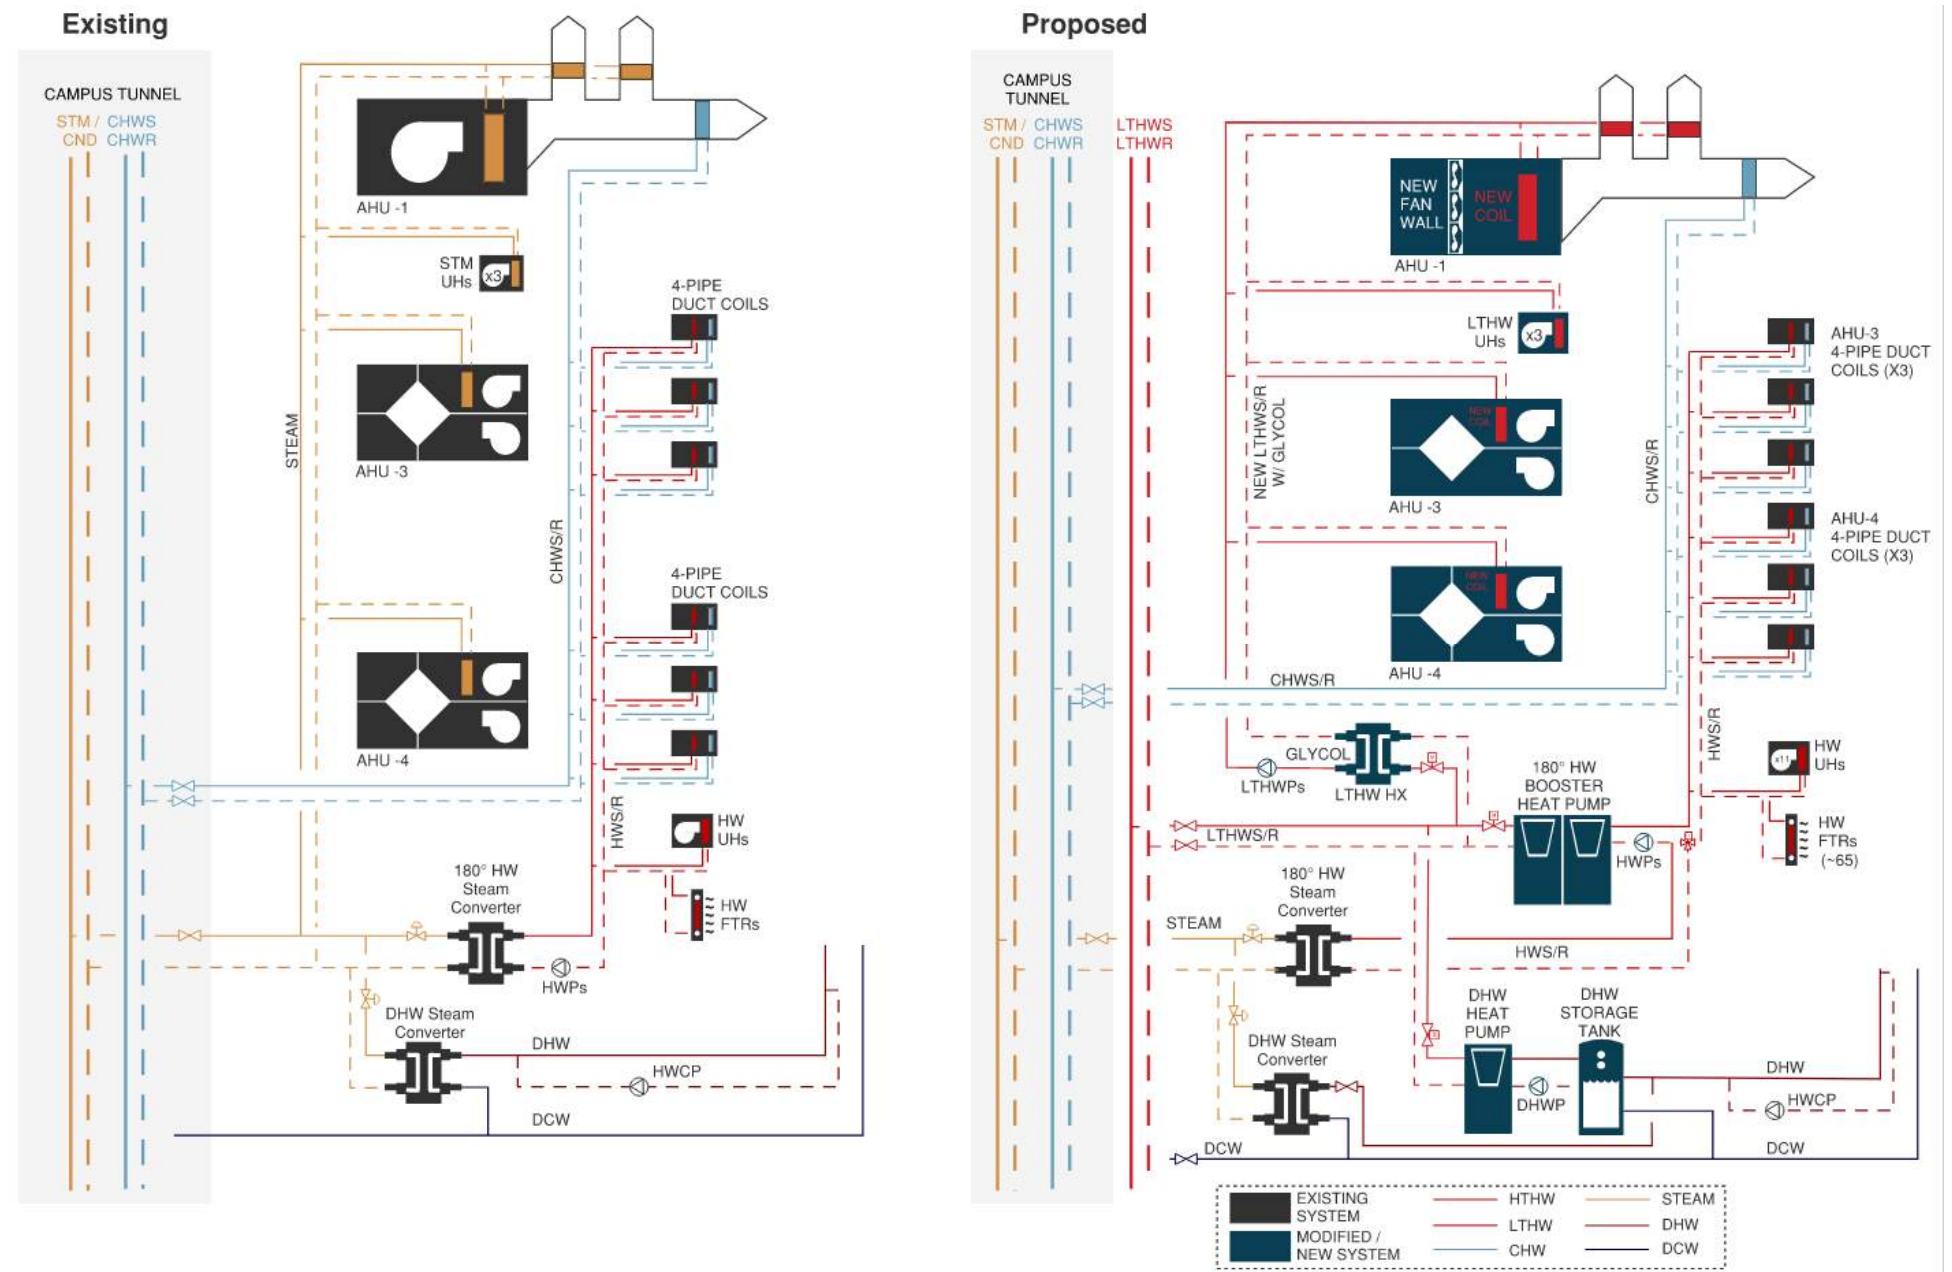

Figure 11: Strategy 3 Mechanical Diagrams

Summary of In-Building Infrastructure

The available electrical capacity and the increased load required to accommodate the proposed upgrades was reviewed at all nine buildings on campus. Metering data was reviewed at each of the buildings, where available, and compared to the capacity as determined from the building service nameplate ratings. **All the buildings reviewed were found to have sufficient electrical capacity available and can accommodate the proposed mechanical revisions without requiring a new electrical service.**

Figure 12: Summary of Existing Electrical Capacity Analysis

Table 8: Summary of Building Electrical Services

| Description |                                  | Existing Electrical Summary |                                 |                            | Decarbonized Electrical Summary |  |  |  |   |

## Decarbonization Solution | Building Electrical Systems

### Summary of Energy Efficiency Measures

The energy efficiency measures below are recommended for implementation. While these measures can occur independently of the decarbonization conversions, they should happen concurrently to capture complementary benefits.

Table 9: Energy Efficiency Measures by Building

| Energy Efficiency Measure                         | Strategy Description   | Applies to   |
|---|--|--|
| Lighting Upgrade                                  | Savings is a result of decreased power draw of LED lamps versus fluorescent lamps  | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>SUT - Sutton Hall<br>ART - Art Building<br><br>MUS - Music Building<br>THE - Theater Building<br>RTV - Radio & TV<br>CMC - Communications Building |
| Lighting Controls                                 | Room- or luminaire-based occupancy sensors will reduce lighting runtime. Recommend installing in study rooms, conference rooms, restrooms, etc..                                   | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>SUT - Sutton Hall<br>ART - Art Building<br><br>MUS - Music Building<br>THE - Theater Building<br>RTV - Radio & TV<br>CMC - Communications Building |
| Window Upgrade                                    | Energy savings is a result of reduced heat loss through energy efficient windows   | ART - Art Building<br>MUS - Music Building   |
| Demand Control Ventilation (DCV)                  | DCV automatically reduce ventilation intensity during off-peak hours, saving energy. Consists of sensors and controllers that adjust ventilation based on indoor air quality (CO2) | JFK - Kennedy Library<br>MUS - Music Building  |
| Damaged Duct / Coil Connections                   | Savings will be a result of decreased heat loss from AHU at damaged ductwork as well as water savings from leaking coil(s).  | THE - Theater Building<br>CMC - Communications Building  |
| Constant Volume to Variable Volume Fans and Pumps | Savings result from ability to throttle pumps, fans, and valves when viable.<br>Increased ability for zone control and scheduling.   | ART - Art Building   |
| Air System Testing and Balancing                  | Process of measuring, adjusting, and verifying HVAC systems to ensure they are functioning effectively and efficiently.  | CEB - Computer & Engineering   |
| Unoccupied Turndown Schedule                      | Unoccupied turndowns will result in reduced heating/cooling load as well as reduced fan energy.  | JFK - Kennedy Library<br>HUS - Huston Hall<br>SUT - Sutton Hall<br><br>ART - Art Building<br>MUS - Music Building<br>RTV - Radio & TV  |

## Decarbonization Solution | Building Conversion Summary and ROM Costs

### Summary of In-Building Renovations

The costs listed below are “all in” costs, reflective of the total cost EWU can expect when implementing these projects. They include the building conversion strategies listed below as well as the energy efficiency measures listed in Table 9. They are ROM costs for budgetary purposes and will need to be refined during the next stage of development/implementation. The appendix provides additional cost information.

Table 10: Building Conversion Summary and ROM Costs.

|     | Building                         | Building Area [s.f.] | Existing System   | Decarbonized System  | Decarbonized System Cost |
|-----|----------------------------------|----------------------|---|--|--------------------------|

| UHs                     |   |   |                  |                 |   |                 |                       |  |  |
| DHW                     | Electric tank type heater are to remain. Add a new WSHP DHW heater to offset the DHW capacity from the steam converter. The steam converter should be left in place as back up. | New supply and return piping from campus LTHW to new DHW Heat Pump.<br>New DHW piping to integrate storage tank.            |                  |                 |   |                 |                       | 337.2 kW new total load for (4x)SBH300 Modular WSHP<br>(2) New 10 HP Pumps |  |
|                         |   |   |                  |                 | Provide new Transom SWH200 WSHPs using the proposed campus LTHW to provide DHW to facility. Provide 100 gallon storage tank. Provide new 20 GPM B&G EcoCirc Pump. Tie into existing DHW system. Existing to remain in place as back up. |                 |                       | 33.7 kW power for new Transom SWH150 WSHP. New 1/2 HP Circ Pump            |  |

## Appendix C | Renovation Scope by Building

| Building                        | Summary of Retrofit | Pipe Replacement   | Coil Replacement   | Fan Replacement  | Booster Heat pump  | Steam Converter | HX & Hydronic Pump(s)   | Electrical Impacts   |   |
|---------------------------------|---------------------|--|--|--|--|-----------------|---|--|---|
| Computer & Engineering Building | AHU-1 C             |  | Retrofit new 1100 MBH LTHW coil into existing AHU cabinet and provide new control valve.   | Retrofit new 49000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |  |                 |   |  |   |
|                                 | AHU-1 H             |  | Retrofit new 600 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 14000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |  |                 |   |  |   |
|                                 | AHU-2 C             | Replace (7) existing AHU steam coils with new LTHW coils.<br>Provide (7) new fan wall sections for AHUs.                               | Route approximately 1500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 5" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 1000 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                   | Retrofit new 51000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   | Install new plate & frame HX between campus LTHW and new building LTHW loops.  |   |
|                                 | AHU-2 H             | Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs.  |  | Retrofit new 1200 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                   | Retrofit new 20000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             | Provide new 3000MBH shell & tube steam to HW converter, pipe in sidecar configuration to building primary variable LTHW loop.   | Install (2)x400gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. Pipe in parallel and tie into new construction hydronic piping loop. Provide typical pump appurtenances (shutoff valves, strainers, P/T ports, etc.) | (2) New 10 HP Building HW Pumps<br><br>(7) New Fan Wall arrays, expected to remain with existing electrical capacity. |
|                                 | AHU-3               | Retain steam connection at building, provide new steam-HW converter and pipe into new hydronic piping.                                 |  | Retrofit new 500 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 20000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | AHU-4               |  |  | Retrofit new 300 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 10000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | AHU-5               |  |  | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 15000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | DHW                 | Add a new WSHP DHW heater to offset the DHW capacity from the steam converter. The steam converter should be left in place as back up. |  | New supply and return piping from campus LTHW to new DHW Heat Pump.<br>New DHW piping to integrate storage tank.           |  |                 | Provide (2) new Transom SWH250 WSHPs using the proposed campus LTHW to provide DHW to facility. Provide 100 gallon storage tank. Provide new 20 GPM B&G EcoCirc Pump. Tie into existing DHW system. Existing steam converter to remain in place as back up. |  |   |

## Appendix C | Renovation Scope by Building

| Building       | Summary of Retrofit | Pipe Replacement   | Coil Replacement   | Fan Replacement  | Booster Heat pump  | Steam Converter | HX & Hydronic Pump(s)   | Electrical Impacts   |   |
|----------------|---------------------|--|--|--|--|-----------------|---|--|---|
| Music Building | AH-1                | Replace existing AHU steam coils with new LTHW coils. Provide new fan wall sections for all AHUs.  | Route approximately 1000ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 4" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 1600 MBH LTHW coil into existing AHU cabinet and provide new control valve. | Retrofit new 40000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             | Install new plate & frame HX between campus LTHW and new building LTHW loops.   | (2) New 7.5 HP Building HW Pumps<br><br>(2) New Fan Wall arrays, expected to remain with existing electrical capacity. |   |
|                | AH-2                | Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs. Retain steam connection at building, provide new steam-HW converter and pipe into new hydronic piping. |  | Retrofit new 600 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 18000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 | Provide new 2000MBH shell & tube steam to HW converter, pipe in sidecar configuration to building primary variable LTHW loop. |  | Install (2)x220 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. Pipe in parallel and tie into new construction hydronic piping loop. Provide typical pump appurtenances (shutoff valves, strainers, P/T ports, etc.) |
|                | UHs                 |  | Replace existing UH with new LTHW UH. Provide new control valve.   | Provide new LTHW UH.   |  |                 |   |  |   |
|                | DHW                 | Existing electric DHW to remain in place.  |  |  |  |                 |   | N/A  |   |

## Appendix C | Renovation Scope by Building

| Building           | Summary of Retrofit | Pipe Replacement   | Coil Replacement  | Fan Replacement  | Booster Heat pump    | Steam Converter   | HX & Hydronic Pump(s)  | Electrical Impacts   |   |
|--------------------|---------------------|--|---|--|----------------------|---|--|--|---|
| University Theater | AHU-1               |  | Retrofit new 1100 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 21000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A                  |   | Install new plate & frame HX between campus LTHW and new building LTHW loops. Install (2) x 5 HP 60 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances.   | (2) New 5 HP Building HW Pumps<br><br>(1) New Fan Wall arrays, expected to remain within existing electrical capacity. |   |
|                    | AHU-2               | 1) Replace existing AHU steam coils with new LTHW coils. Provide new fan wall sections for all AHUs. Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs. | Route approximately 1000ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 4" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc) and fill with 30% glycol solution. | N/A<br>Cooling Only  |                      |   |  |  | N/A<br>Cooling Only   |
|                    | Steam Converter     | 2) Deploy a high temperature booster heat pump using the proposed campus LTHW as a source, and creating HTHW for the existing terminal HW loop.  | New piping for LTHW loop to existing terminal HWR for back up heating to AHU coils.   | N/A  | N/A                  | Provide a (2) SBH100 30 ton modular water to water heat pump located in the existing mechanical room. The combined total is 750 MBH which will provide for the system load the majority of the year. Connect in sidecar configuration to existing building piping loop. Provide new controls for WWHP and accessories, tie into existing building BAS. Assume (20) physical points & (40) virtual points. | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | 53 kW new (2x)SBH100 Modular WSHP<br>(2) 3 HP B&G EcoCirc 375XL or similar.  |   |
|                    | Reheat Terminals    | The existing steam converter and pump infrastructure shall remain in place as backup. HW & CHW piping infrastructure and coils will remain unchanged.  |   |  |                      |   | Pipe in parallel and tie into existing hydronic piping loop.   |  |   |
|                    | Radiators           |  |   |  |                      |   |  |  |   |
|                    | CUHs                |  |   |  |                      |   |  |  |   |
|                    | UHs                 | Replace steam UH with LTHW   | Route 100ft of new copper HW piping to branch to new UHs in Mechanical spaces. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.)  | Replace existing UH with new LTHW UH. Provide new control valve.   | Provide new LTHW UH. | N/A   |  |  | (3) New UHs expected to remain within existing electrical capacity. |
|                    | DHW                 | Existing electric DHW to remain in place.  |   |  |                      |   |  |  | N/A   |

## Appendix C | Renovation Scope by Building

| Building     | Summary of Retrofit | Pipe Replacement  | Coil Replacement   | Fan Replacement  | Booster Heat pump   | Steam Converter | HX & Hydronic Pump(s)  | Electrical Impacts  |  |
|--------------|---------------------|---|--|--|---|-----------------|--|---|--|
| Art Building | AHU-1               | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2.5" & 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution.                                     | Retrofit new 1800 MBH LTHW coil into existing AHU cabinet and provide new control valve.   | Retrofit new 36085 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A   |                 |  |   |  |
|              | AHU 1 - Duct Coil 7 |   | Retrofit new 400 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 1 - Duct Coil 8 |   | Retrofit new 700 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU-3               | 1) Replace existing AHU steam coils with new LTHW coils. AHU-1 Preheat, AHU 1 Duct Coils 7 & 8, AHU 3 & 4 Preheat Coils. Provide new fan wall sections for AHUs 1, 3 & 4.<br><b>(New AHU preheat coils are downsized to reflect realistic loads that account for heat recovery &amp; 4°F OSA design temp. )</b> | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 8950 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | Install new plate & frame HX between campus LTHW and new building LTHW loops.<br><br>Install (2) x 20 HP 450 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. | (2) New 20 HP Building HW Pumps<br><br>(3) New Fan Walls expected to remain within existing electrical capacity. |
|              | AHU 3 - Duct Coil 1 | N/A maintain HWS/R piping.  | Retrofit new 200 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 3 - Duct Coil 2 |   | Retrofit new 100 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU 3 - Duct Coil 3 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU-4               | 2) Replace (6) 180°F duct coils with 120°F duct coils served by LTHW.<br><br>Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs.  | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 8550 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             |  |   |  |
|              | AHU 4 - Duct Coil 4 | N/A maintain HWS/R piping.  | Retrofit new 200 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 4 - Duct Coil 5 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU 4 - Duct Coil 6 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |

## Appendix C | Renovation Scope by Building

| Building                 | Summary of Retrofit  | Pipe Replacement  | Coil Replacement  | Fan Replacement  | Booster Heat pump    | Steam Converter  | HX & Hydronic Pump(s)  | Electrical Impacts  |  |
|--------------------------|--|---|---|--|----------------------|--|--|---|--|
| Art Building (continued) | Steam UHs  | Replace (3) steam UHs with new LTHW UHs.  | Route approximately 100ft of new copper HW piping to each UH, with sizes ranging from 1 1/2" 1" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Replace existing UH with new LTHW UH. Provide new control valve. | Provide new LTHW UH. | N/A  | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | Install new plate & frame HX between campus LTHW and new building LTHW loops.<br><br>Install (2) x 20 HP 450 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. | (3) New UH's expected to remain within existing electrical capacity. |
|                          | Perimeter Steam to HW Converter  | Deploy a high temperature booster heat pump using the proposed campus LTHW as a source, and creating HTHW for the existing perimeter HW loop. The existing steam converter and pump infrastructure shall remain in place as backup. HW & CHW piping infrastructure and coils will remain unchanged. | N/A maintain HWS/R piping.  | N/A  | N/A                  | Provide a (2) SBH200 60 ton modular water to water heat pump located in the existing mechanical room. The combined total is 1450 MBH which will provide for the system load the majority of the year. Connect in sidecar configuration to existing building piping loop. Provide new controls for WWHP and accessories, tie into existing building BAS. Assume (20) physical points & (40) virtual points. | Provide new duplex ECM circulator pump array serving the WWHP, B&G EcoCirc 375XL or similar.<br><br>Provide dedicated magnetic filter on header. Cheney Campus 1st GeoEco Plant - Project Site

# SECTION 1

## PROJECT OVERVIEW

## 1.0 PROJECT OVERVIEW

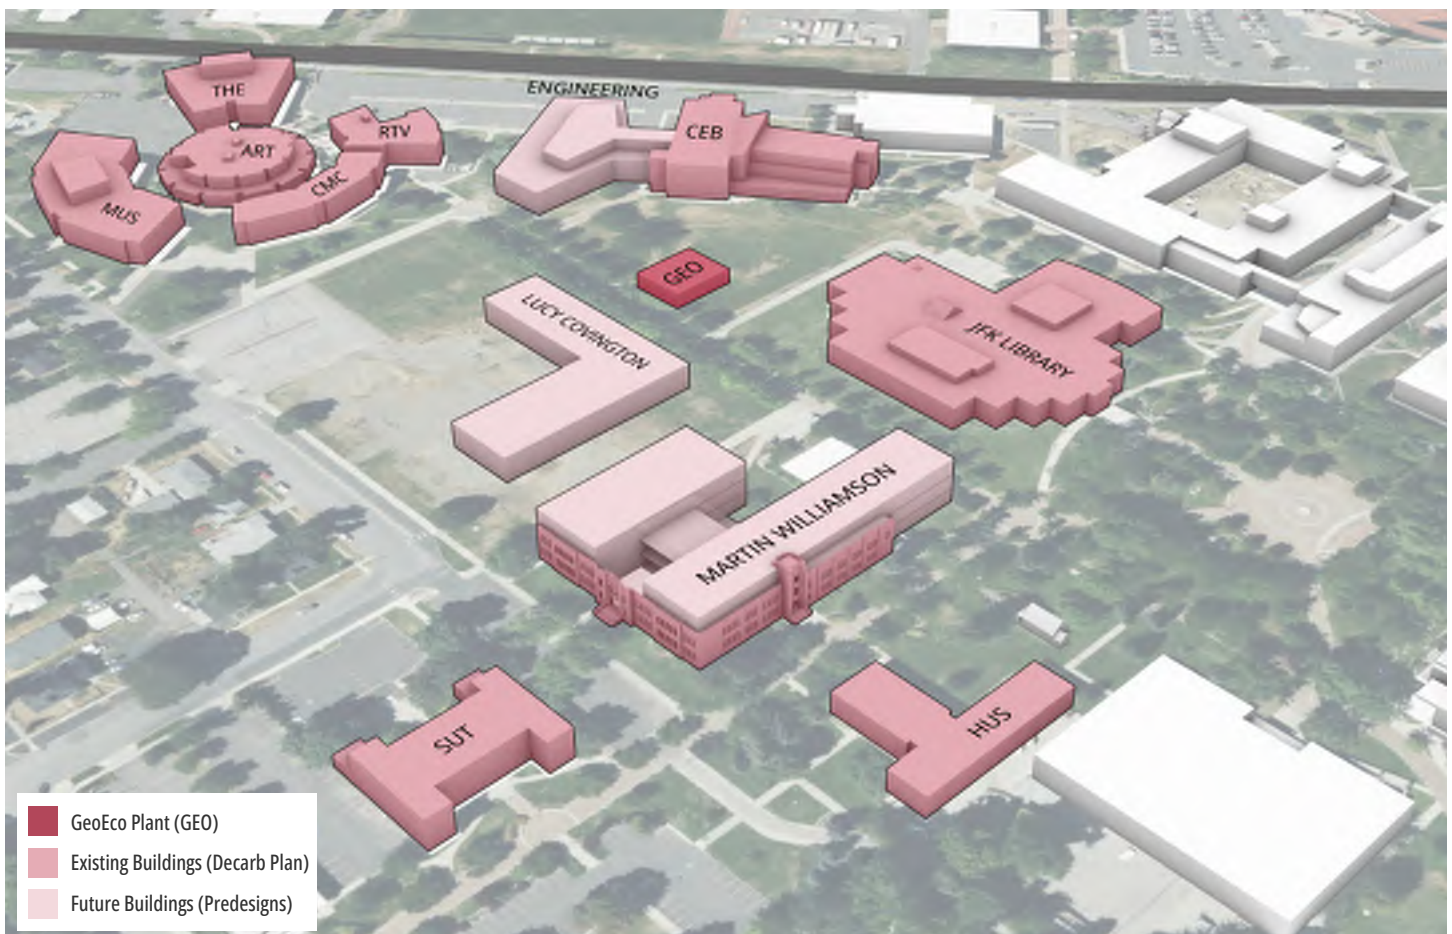

### 1.1 PROBLEM SUMMARY

Eastern Washington University is working to reduce its Energy Use Intensity (EUI) to meet the Clean Building Performance Standard requirements and to decarbonize their campus operations. The proposed GeoEco Plant is EWU's first step towards shifting away from fossil fuel-based steam boilers toward an alternative all-electric energy source.

EWU is requesting funding for the design and construction of their first GeoEco Plant which will support the transition of over 500,000 square feet of buildings off of campus steam. This proposal outlines the feasibility and benefits of installing a geothermal nodal utility plant to service a portion of the EWU Cheney campus with a new all-electric heating and cooling system.

The GeoEco Plant will be sized to support a total of eleven buildings on the EWU Cheney campus. It is planned to connect to three projects submitted as predesigns for the 2025-2027 capital budget request and to transition eight existing buildings off campus steam. The buildings that will be connected to the new system include Martin Williamson Hall (MAR & WLM), Computing and Engineering Building (CEB) and future Engineering addition, JFK Library, future Lucy Covington Center, Radio/TV Building (RTV), University Theatre (THE), Art Building (ART), Music Building (MUS), Communications Building (CMC), Sutton (SUT), and Huston (HUS).

The existing steam boilers within the central utility plant are the primary contributors of carbon emissions at Eastern Washington University. EWU is the City of Cheney's largest natural gas customer. Transitioning heating loads from these steam boilers to all-electric heating systems will significantly reduce the campus' carbon emissions.

*Campus Map of Buildings to be Supported by the GeoEco Plant*

## 1.2 MISSION ALIGNMENT

This project aligns with EWU’s newly drafted Institutional Strategic Plan, Comprehensive Campus Master Plan, the Climate Action Plan, and the Climate Resiliency Landscape Master Plan.

### Institutional Strategic Plan:

The new Institutional Strategic Plan identifies sustainability as one of six institutional values, expressing a desire to balance the needs of the environment with current and future generations.

### Comprehensive Campus Master Plan:

The current Comprehensive Campus Master Plan speaks to reducing the campus carbon footprint and the impact of university operations on the environment through decarbonization and natural resource management.

### Climate Action Plan:

The Climate Action Plan states that EWU is committed to becoming a carbon neutral institution and a leader in sustainable practices. It identifies campus targets, approaches, and methods for reducing EWU’s campus imprint for energy and carbon.

Decarbonization is a common theme and initiative across EWU’s Institutional Strategic Plan, Comprehensive Campus Master Plan, and Climate Action Plan. Transitioning campus infrastructure through the proposed GeoEco Plant will educate current generations and benefit future generations through significant carbon reductions.

### 1.3 SUMMARY OF ALTERNATIVES

Several comprehensive evaluations of various energy system options to decarbonize the existing fossil fuel fired central steam plant have been conducted. The key studies and their findings, including this infrastructure request, are as follows:

#### 1. EWU Hydrogeological Evaluation:

This study assessed several potential systems for replacing the existing central steam plant, including:

- Air-source heat pumps
- Open-loop ground source heat pump
- Closed-loop ground source heat pump
- Alternative fuels, such as bio-diesel, renewable gas, and green hydrogen
- Emerging zero-carbon steam production technologies
- A centralized open-loop ground source heat pump plant for the entire campus
- Multiple nodal open-loop ground source heat pump plants, initially serving clusters of building with a long-term goal of expanding incrementally across campus
- Building-specific open-loop ground source heat pumps

#### 2. EWU Decarbonization Plan:

Although still in progress, this plan continues to explore and refine options for decarbonizing the campus. It revisits many of the systems and technologies evaluated in the EWU Hydrogeological Evaluation and this GeoEco Plant Infrastructure Request, including:

- Combustion steam options: Renewable natural gas boilers, biomass boilers, hydrogen boilers, co-generation boilers, and carbon capture.
- Non-combustion steam options: Deep geothermal, micro-nuclear, and electrode boilers.
- High-temperature hot water systems: Heat exchangers with high-temperature heat pumps, low-temperature heating water with secondary heat pumps, steam heat pumps, and in-building electric boilers.
- Low-temperature hot water systems: Open-loop geo-exchange, closed-loop geo-exchange, air-to-water heat pumps, surface water exchange, and campus server heat recovery.

#### 3. EWU GeoEco Plant Infrastructure Request:

This study and infrastructure request evaluated potential

configurations and distribution methods for an open-loop ground source heat pump system to provide all-electric heating across the university campus as recommended by the EWU Hydrogeological Evaluation and EWU Decarbonization Plan. Key findings and consideration include:

- Hybrid Nodal Plant Concept: The EWU Hydrogeological Evaluation supports a hybrid nodal plant setup, distributing groundwater to buildings with heat pumps and backup systems located within each building, requiring additional square footage within each connected building for equipment installation.
- GeoEco Plant Concept: An alternative approach to the Hybrid Nodal Plant Concept, this centralized plant would house all essential equipment and infrastructure, distributing low-temperature heating water and chilled water to buildings without the need for additional equipment inside each building, reducing space and renovation needs.
- Piping Distribution: The study explored the routing of new piping systems for groundwater, heating water, and chilled water, recommending the installation of direct-burial, double-wall piping to extend the lifespan of these systems while minimizing capital costs by avoiding expansion of the existing campus tunnel system.
- Energy Efficiency: In addition to the efficiency of a ground source heat pump system, the existing chilled water system can be leveraged to enable energy trading between buildings, optimizing energy use and reducing installation costs by repurposing current infrastructure.
- Educational Opportunity: A strategically located GeoEco Plant near the engineering and science buildings will serve as an educational tool, offering a visible example of sustainable energy practices. This setup aims to engage students, faculty, and the community in understanding how EWU is reducing operational carbon emissions in alignment with Washington State goals.

**Recommendation:** The study recommends moving forward with the GeoEco Plant concept, emphasizing its benefits, including centralized maintenance, minimized impact on existing buildings, cost-effective piping installation, and enhanced educational opportunities.

## 1.4 SUMMARY OF PROPOSED ALTERNATIVE

EWU is requesting funding for the design and construction of their first GeoEco Plant which will support the transition of over 500,000 square feet of buildings off of the existing fossil-fueled campus steam system to an all-electric open-loop ground source heat pump system. The following is a summary of the proposed alternative in addition to the findings and considerations included in the preceding Summary of Alternatives.

### SYSTEM

The proposed conversion to an all-electric heating system for the evaluated buildings would employ a single-pass open-loop ground-source heat pump system, as detailed in the January 8, 2024, EWU Campus Hydro-Geological Assessment as prepared by Landau and MSI. This new central utility plant, referred to as the GeoEco Plant (GEP), is designed to be highly efficient in generating all-electric heating and cooling water.

One significant limitation of single-pass ground-source heat pump systems is that they typically produce heating water at temperatures up to approximately 125°F. Many existing buildings at EWU were originally designed for higher temperature heating water (160-180°F), posing challenges in converting these systems to utilize the lower temperature water generated by geothermal heat pumps.

The replacement, addition, and new construction projects explored offer opportunities to design systems that utilize low-temperature heating water. Existing buildings not currently addressed in the predesign process would undergo future conversion projects to adapt to the new low temperature heating water system.

The method of distributing the new low-temperature heating water (LTHW) system was carefully considered. Currently, the campus uses a tunnel system for steam and chilled water distribution. Due to physical constraints, it is unlikely that the new LTHW piping could fit within the existing tunnels. Additionally, the high initial first costs of enlarging the existing tunnel or adding a new tunnel system outweigh the long-term benefits. Consequently, a new direct bury piping network will

be used to distribute LTHW across the campus, connecting the GEP to this initial group of buildings and future GEP nodes. The new GEP will connect to and utilize the existing chilled water distribution system currently distributed across campus through the existing tunnel system. This new open-loop ground-source heat pump system will offer a more efficient cooling system for the campus when compared to the existing central chilled water plant and would be utilized as the first stage of cooling, further lowering the campus energy use and carbon emissions attributed to electricity use.

The feasibility of providing multiple connections to the Cheney aquifer for geothermal energy to service the entirety of EWU's campus has been validated based on other wells in the region. The EWU Campus Hydro-Geological Assessment completed on January 8, 2024, supports the potential for decarbonizing EWU's existing natural gas steam system through several GeoEco Plants. This project could serve as the first phase of a broader decarbonization effort.

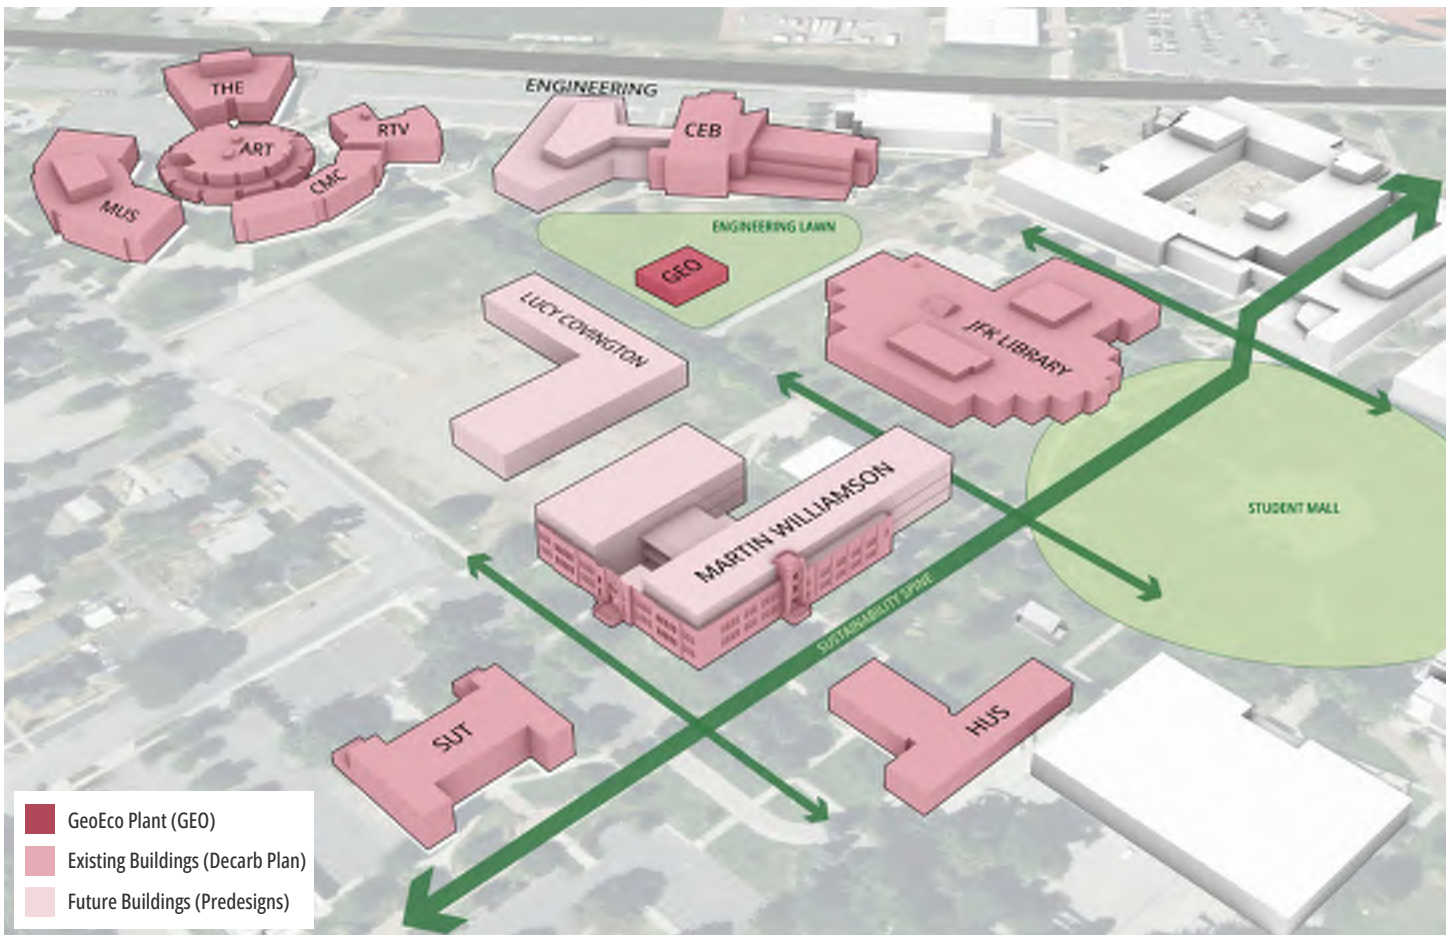

The proposed GeoEco Plant (GEP) would be designed to service at least the eleven buildings studied in this report, which encompass over 500,000 square feet of high-energy intensity Arts, Engineering, and Academic spaces. Over a 50-year period, as outlined in the Energy Life Cycle Cost Analysis (ELCCA), the GEP would result in a CO<sub>2</sub> reduction equivalent to removing approximately 9,200 cars from the road, or about 46,000 metric tons of CO<sub>2</sub>.

## LOCATION

The GeoEco Plant’s proposed location was selected for its central relationship to the buildings that will connect to it, but also for its presence near the heart of the campus. By locating the plant just off the emerging Sustainability Spine and near the Engineering Lawn of the Computing and Engineering Building it offers the opportunity to use this new infrastructure as a tool to educate students, faculty, and the community on the shift in campus infrastructure and engineering technologies that are making decarbonization at a campus scale possible.

The building will be designed to not only functionally support the heating and cooling needs of this portion of campus but to express EWU’s values and steps toward decarbonization to students, faculty, the local Cheney community, and others who may be interested in how the campus is reshaping their energy generation systems.

In addition to supporting EWU’s carbon reduction goals and offering educational opportunities, this GeoEco Plant will be a resource and example for other institutions in Eastern Washington and Idaho that may be interested in a similar model to reduce carbon emissions in their campus energy generation infrastructure.

Campus Map of Connections to the GeoEco Plant

## 1.5 PROJECT HISTORY

EWU has performed a number of studies and evaluations to find the most effective approach to shifting away from their long-time fossil fueled campus steam.

### STUDIES & EVALUATIONS

The following studies demonstrate the feasibility of this proposal and impact it will have on EWU's decarbonization.

#### Completed Studies:

- EWU Ground Source Heat Pump Evaluation
- EWU Hydrogeological Assessment
- Martin Williamson Hall Predesign
- Engineering Building Predesign
- Lucy Covington Leadership House Predesign
- EWU Geo Eco Plant Infrastructure Request

#### In-Progress Studies:

- EWU Decarbonization Plan

All completed and in-progress studies have been included in the appendix of this document for reference. The following are brief summaries and the recommendations of each study demonstrating support of the proposed new GeoEco Plant.

#### EWU Ground Source Heat Pump Evaluation:

Completed in January of 2024, this evaluation outlines requirements for permitting and water rights, alignment of anticipated aquifer yield to necessary capacity, sufficient thermal capacity of groundwater, and the ability to maintain groundwater temperatures long-term.

**Recommendation:** The feasibility of providing multiple connections to the Cheney aquifer for geothermal energy to service the entirety of EWU's campus has been validated based on other wells in the region. This study supports the potential for decarbonizing EWU's existing natural gas steam system through several open-loop ground source heat pumps. Further validation is expected from a test well, which is currently in progress.

GSHP Evaluation - See Appendix 2.3

**EWU Hydrogeological Assessment:**

Completed in January of 2024, this assessment demonstrates the feasibility and economic viability of converting EWU’s district heating and cooling systems to Ground-Source Heat Pump systems (GSHPs). It explored three different case studies including the implementation of the systems at a building scale, district scale (four buildings), and a campus scale (all 45 buildings).

**Recommendation:** The study recommended the use of an open-loop ground source heat pump system, utilizing a hybrid nodal plant concept via a combination of nodal plants to distribute groundwater to buildings, with heat pumps located within the serviced buildings. This approach was validated through the EWU Hydrogeological Evaluation.

**Martin Williamson Hall Predesign:**

Completed in June of 2024 and submitted for the 2025-2027 capital budget request proposed an intensive renovation of Martin Williamson Hall. During the pre-design process, three energy system variations were explored: the Base Package, the High-Performance Package, and the Net Zero Package. These packages provided a pathway to achieving net-zero energy use for the building, with each option’s life cycle cost evaluated. A key assumption in this report is that all energy systems would connect to a future fossil-fuel-free heating source—specifically, an open-loop ground source heat pump system, referred to as the GeoEco Plant Concept.

**Engineering Building Predesign:**

Completed in June of 2024 and submitted for the 2025-2027 capital budget request proposed the renovation and major addition for the Computing and Engineering Building. The pre-design process was utilized to assess both renovation and new construction options, aiming to enhance the functionality of the Computing and Engineering Building while also reducing its operational carbon footprint. This report focuses on integrating all new and existing energy systems with a future fossil-fuel-free heating source. The pre-design evaluated connecting to the future open-loop ground source heat pump system, known as the GeoEco Plant Concept.

Hydrogeological Assessment - See Appendix 2.4

Martin Williamson Predesign - See Appendix 2.5

Engineering Building Predesign - See Appendix 2.6

**Lucy Covington Leadership House Predesign:**

Completed in June of 2024 and submitted for the 2025-2027 capital budget request proposed the new construction of the Lucy Covington Leadership House. The pre-design phase for the new construction of Lucy Covington prioritized identifying energy systems that would significantly reduce the building’s operational carbon footprint. This report highlights that all heating and cooling needs are expected to be met by connecting to a new open-loop ground source heat pump system, referred to as the GeoEco Plant Concept.

Lucy Covington Leadership House Predesign - See Appendix 2.7

**EWU GeoEco Plant Infrastructure Request:**

Completed in September of 2024, this study and infrastructure request evaluated potential configurations and distribution methods for an open-loop ground source heat pump system to provide all-electric heating across the campus as recommended by the EWU Hydrogeological Evaluation and EWU Decarbonization Plan.

**Recommendation:** The study recommends moving forward with the GeoEco Plant concept, emphasizing its benefits, including centralized maintenance, minimized impact on existing buildings, cost-effective piping installation, and enhanced educational opportunities.

**EWU Decarbonization Plan (In-Progress):**

In-progress to be completed June 2025, this plan identifies the in-building MEP system conversions needed to connect nine existing buildings to the proposed GeoEco Plant. Upon completion it will identify how the campus can expand the first GeoEco Plant concept to implement decarbonization campus-wide to meet EWU’s decarbonization goals and House Bill 1390’s madate to remove fossil fuels from campus heating systems by 2040. Energy efficiency measures have been identified and priced for inclusion in the 2025-2027 capital request. These measures should be implemented in tandem with the building-level decarbonization measures. Not only do they contribute to meeting the campus-wide EUI target mandated by HB 1390, but they also reduce load on the new geothermal system.

**Recommendation:** The plan currently recommends constructing GeoEco Plants over several biennia, this request representing the first.

GeoEco Plant Request - This Document

Decarbonization Plan - See Appendix 2.8

1.6 BUDGET SUMMARY

MAJOR ASSUMPTIONS

A third-party cost estimation and C-100 were prepared for this request. The cost estimation assumes an approach to building and equipment organization that supports the vision of EWU that this GeoEco Plant provide a teachable moment for the campus and community. This project assumes a single phase approach with the building, wells, equipment, and pathway all being designed and constructed in a single phase.

The estimate assumes a well size and quantity that is based on the information uncovered and documented in the EWU Ground Source Heat Pump Evaluation and EWU Hydrogeological Assessment. The wells represents the majority of the construction cost for the project and their size and quantity will be confirmed during design and upon completion of the test well which EWU has underway.

SUMMARY TABLE

The following tables outline the cost summary of the proposed infrastructure request. The complete C-100 document and associated cost estimate are included in the Appendix as 2.1 and 2.2.

| Summary Construction Budget           |                        |
|---------------------------------------|------------------------|
|                                       | TOTAL                  |
| G10 - Site Preparation                | \$588,165              |
| G20 - Site Improvements               | \$0                    |
| G30 - Site Mechanical Utilities       | \$26,152,397           |
| G40 - Site Electrical Utilities       | \$1,747,020            |
| G60 - Other Site Construction         | \$0                    |
| <b>Site Work Subtotal</b>             | <b>\$28,487,582</b>    |
| A10 - Foundations                     | \$281,139              |
| A20 - Basement Construction           | \$0                    |
| B10 - Superstructure                  | \$670,110              |
| B20 - Exterior Closure                | \$494,101              |
| B30 - Roofing                         | \$303,798              |
| C10 - Interior Construction           | \$0                    |
| C20 - Stairs                          | \$0                    |
| C30 - Interior Finishes               | \$0                    |
| D10 - Conveying                       | \$0                    |
| D20 - Plumbing Systems                | (with site mechanical) |
| D30 - HVAC Systems                    | (with site mechanical) |
| D40 - Fire Protection Systems         | \$46,750               |
| D50 - Electrical Systems              | (with site electrical) |
| F10 - Special Construction            | \$0                    |
| F20 - Selective Demolition            | \$0                    |
| E10 - CFCI Equipment                  | \$0                    |
| General Requirements                  | \$2,559,711            |
| General Conditions                    | \$3,325,796            |
| OH&P + Insurance                      | \$3,118,689            |
| <b>Facility Construction Subtotal</b> | <b>\$10,800,094</b>    |
| <b>Unescalated MACC</b>               | <b>\$39,287,676</b>    |
| <b>Escalated MACC</b>                 | <b>\$42,097,636</b>    |

| Summary Budget       |                     |                        |
|----------------------|---------------------|------------------------|
|                      | Total Cost          | Total Cost - Escalated |
| Acquisition          | \$0                 | \$0                    |
| Consultants          | \$9,837,743         | \$10,558,367           |
| Construction         | \$46,820,405        | \$50,236,428           |
| Equipment            | \$21,780            | \$23,701               |
| Artwork              | \$318,523           | \$318,523              |
| Project Admin        | \$2,652,121         | \$2,886,039            |
| Other Costs          | \$0                 | \$0                    |
| <b>Total Project</b> | <b>\$59,650,572</b> | <b>\$64,023,058</b>    |

1.7 SCHEDULE & NEXT STEPS

This proposed GeoEco Plant will be the first step for EWU to transition away from fossil fuel generated steam toward an all-electric geothermal heat pump system that advances EWU’s decarbonization initiatives. The GeoEco Plant concept is a model that could eventually be applied to the entire campus in a scalable manner that supports the future potential of energy exchange across multiple geothermal nodes. However, should new technologies that are more efficient or economical be developed in the future it also offers a flexibility for change and campus diversification.

The immediate next step for advancing the GeoEco Plant concept involves confirming the assumptions of the EWU Ground Source Heat Pump Feasibility Study by developing a test well to determine the availability and characteristics of the aquifer beneath the campus. EWU is currently preparing the necessary documentation to permit this initial test well. The findings from this test well will provide essential information for designing the GEP. The design team, composed of hydrogeologists, civil engineers, mechanical engineers, electrical engineers, and architects, will utilize this data to proceed with the project.

In parallel, the ongoing refinement of the decarbonization plan, expected to be finalized by 2025, will continue. This refinement will involve evaluating additional options and developing a comprehensive strategy for EWU to meet the requirements of Washington State’s House Bill 1390, aiming for carbon neutrality by decarbonizing the central utility plant. The plan will outline key pathways for achieving these goals, including the potential expansion of GeoEco Plants to service other areas of the campus and implementing building-specific measures to enhance energy efficiency and facilitate connections to the GEP.

As part of the 2025-2027 capital request, the implementation of other projects, such as the renovation and connection of Martin Williamson Hall, the Computing and Engineering Building, and Lucy Covington Hall to the GEP, will further reduce the university’s reliance on its existing fossil fuel-fired steam heating plant, moving EWU closer to its decarbonization goals.

The below project schedule depicts the project phases and anticipated completion dates.

| Project Phase           | Date of Completion |
|-------------------------|--------------------|
| Design                  | July-26            |
| Bid/ Award/ Contracting | August-26          |
| Building Construction   | November-27        |
| Well Construction *     | December-27        |
| Commissioning & Startup | December-27        |

1.8 DELIVERY METHOD & MANAGEMENT

Eastern Washington University’s Construction and Planning Division will manage all aspects of the project. They will work with the architect/engineer(A/E) consultant design team throughout the design, bidding, construction, and commissioning, and warranty phases. The Construction and Planning Division will oversee the required contractual administration for the project architect/engineer (A/E) consultants and public works contractors. The Construction and Planning team is responsible for working closely with the university’s administration, the design team, and the contractors to ensure the project is delivered on time and within budget.

The project will use the Design-Bid-Build (DBB) project delivery method per RCW 39.04 – Public works. This is the delivery method that is most frequently used by Eastern Washington University. The school is familiar and experienced with this delivery method and has found that it has been the most cost-effective by promoting competitive bidding between interested general contractors and subcontractors.

1.9 IMPACT WITHOUT INFRASTRUCTURE PROJECT

Securing funding for the GeoEco Plant (GEP) is crucial for EWU to take a significant step toward campus decarbonization and reducing its reliance on fossil fuels for heating and domestic hot water generation, in alignment with the requirements of Washington State’s House Bill 1390. Additionally, the construction of the GEP, along with planned renovations, upgrades, and new construction projects, will substantially lower the campus’ energy use index (EUI). This reduction is essential for bringing EWU into compliance with the Washington Clean Building Performance Standard. Immediate action to reduce campus carbon emissions is imperative, and any delay in funding could hinder or even prevent this section of the campus from transitioning to a fossil-fuel-free heating system, jeopardizing both environmental and regulatory goals.

The preferred alternative of the three predesigns EWU submitted for the 2025-2027 capital budget request all proposed connecting to the GeoEco Plant to meet the Clean Building Performance Standard requirements and advance EWU’s decarbonization initiatives. Without the GeoEco Plant these projects will not be feasible or will need to shift their intended infrastructure away from low carbon renewable sources and back to the existing fossil fueled campus steam system.

| Position                            | Time On Project | Duties:   |
|-------------------------------------|-----------------|---|
| Director of Construction & Planning | 15%             | Oversees project planning and implementation for campus         |
| Sr. Project Manager                 | 85%             | Supervises construction implementation and project coordination |
| Construction Project Coordinator    | 45%             | Assists with project coordination for campus                    |
| Office Assistant                    | 15%             | Assists with administrative tasks for project                   |
| <b>Totals</b>                       | <b>160%</b>     |   |

## GEP Building

### Scope of Work

#### Project Scope Description

The project comprises cost planning for the Eastern Washington University campus GEP Building. The proposed design includes expanding the utilidor; a 5,500 mass timber and curtainwall building and geo-thermal equipment and bore field.

#### Project Design

The cost report is based on the following information:

- Memo from MW Engineers dated July 10, 2024
- 2024-07-10 GEP Conceptual Site Plan
- Conversations with Integrus

#### Procurement

It is anticipated that the project will be delivered by Design Bid Build with a minimum of 4 to 5 qualified General Contractors to maintain competitive pricing. The start date is anticipated for Q2 2025.

Eastern Washington University  
GEP Building

Basis of Estimate

Assumptions and Clarifications

This estimate is based on the following assumptions and clarifications:

- 1 The estimate is based on the drawings listed in the scope of work and conversations with the Architects and Engineers.
- 2 Standard working hours.
- 3 Prevailing wages apply.
- 4 Owners soft costs are not included.
- 5 Sales tax is not included.

## EXECUTIVE SUMMARY

This report documents a preliminary hydrogeologic evaluation by Landau Associates, Inc. (Landau) of open-loop ground source heat pump (GSHP) well field alternatives for the Eastern Washington University (EWU) campus in Cheney, Washington. Landau has prepared the evaluation in partnership with Water and Natural Resources Group, Inc. (WNR) in support of MSI Engineers' (MSI) assessment of the feasibility and economic viability of converting EWU's heating and cooling system to GSHPs. Landau and WNR's scope of work is to develop a hydrogeologic conceptual model, including hydraulic and thermal modeling, and conduct a water rights and permitting evaluation. Landau and WNR completed assessment of three well field operation case study scenarios provided by MSI. Each case study consists of an injection well(s) and a pumping well(s) at various well spacing and pumping rates. A project vicinity map is presented on Figure 1. The scope of the evaluation was limited to a desktop study of the existing literature and available aquifer testing data for the area.

The hydrogeologic evaluation addressed three primary questions: 1) what are the permitting and water rights requirements for GSHP well field installation, 2) is aquifer yield sufficient to meet system capacity, and 3) can the aquifer provide sufficient thermal capacity while maintaining groundwater temperatures within practically operable ranges for GSHP on a long-term sustainable basis?

Three GSHP system options were evaluated:

1. Case Study 1 – Martin-Williamson Hall GSHP System: GSHP system to supply heating and cooling to Martin-Williamson Hall
2. Case Study 2 – Four Buildings, Micro-District GSHP System: GSHP system to supply heating and cooling to Martin-Williamson Hall, JFK Library, the Computing and Engineering Building, and the Art-Theater-Music Complex
3. Case Study 3 – Entire Campus GSHP System: GSHP system to supply heating and cooling to the entire EWU campus.

Implementation of a GSHP will require a new non-consumptive water right authorization from the Washington State Department of Ecology (Ecology). WNR completed a draft water right application, which is presented in Appendix D.

## SUMMARY OF FINDINGS

The following findings are supported by the hydrogeologic evaluation and modeling efforts described in the report:

- GSHP wellfield permitting requirements include obtaining a new water right and registration of all injection wells with Ecology's Underground Injection Control Program. Permitting requirements are unlikely to constrain project implementation.
- The EWU campus is underlain by a productive aquifer within the Grande Ronde Basalt Formation (Grande Ronde Basalt) of the Columbia River Basalt Group (CRBG). Landau's preliminary hydrogeologic evaluation suggests aquifer yield is sufficient to meet system capacity

for all three case study scenarios. Additional aquifer testing is recommended for the next phase of feasibility analysis to confirm aquifer yield in the campus area.

- Thermal modeling completed with the computer programs MODFLOW and MT3DMS suggests that, with proper placement of extraction and injection wells, groundwater temperatures at the point of extraction will fluctuate within a range of acceptable temperatures for operation of the GSHP system. Steady-state thermal conditions were simulated by running the thermal model for each case study for a period of 5 years, cycling between heating and cooling periods.

## 1.0 PROJECT BACKGROUND

This report documents a preliminary hydrogeologic evaluation by Landau Associates, Inc. (Landau) of open-loop ground source heat pump (GSHP) well field alternatives (project) for the Eastern Washington University (EWU) campus in Cheney, Washington. Landau has prepared the evaluation in partnership with Water and Natural Resources Group, Inc. (WNR) in support of MSI Engineers' (MSI) assessment of the feasibility and economic viability of converting EWU's heating and cooling system to GSHPs.

The ground source heat pump (GSHP) system proposed by MSI is an open-loop type system, where groundwater is pumped out of the aquifer, circulated through a heat exchanger, and reinjected back into the aquifer. Hydraulic and thermal modeling was completed to evaluate hydraulic and thermal capacity of the local aquifer to meet the GSHP demands for each case study. Aquifer extraction requires a water right from the Washington State Department of Ecology (Ecology) and reinjection requires registration with Ecology's Underground Injection Control (UIC) program. Permitting considerations are discussed in the following section, followed by a discussion of the hydrogeologic assessment, modeling results, well design, and recommendations.

## 2.0 PERMITTING CONSIDERATIONS

The project will first require a water right permit for the GSHP. Typically, new water right applications are acted upon in the order in which they are received by Ecology, which assigns the application's priority date. Certain new water right applications are granted priority processing dependent upon certain proposed project requirements and conditions. Under Washington Administrative Code (WAC) 173-152-050(2), an application may receive priority processing if Ecology determines that, "the proposed water use is non-consumptive and if approved would substantially enhance or protect the quality of the natural environment (WAC 173-152-050[2][b]). Ecology also has Policy 2020 – Priority Processing of Heat Pump Applications." This policy also states that a withdrawal for heat exchange purposes may be afforded priority processing if the conditions under WAC 173-152-050(2)(b) are met. The proposed EWU GSHP open-loop heat exchange system meets the criteria set forth in WAC 173-152-050(2)(b) and as such, Ecology should afford it a priority processing status.

Ecology Policy 2020 governs the determination of consumptive versus non-consumptive water use. The policy defines groundwater use as non-consumptive when, "there is no diminishment of the source." As proposed with this project, the groundwater withdrawn for the GSHP will immediately be injected back to the source "in the same quantity and quality (excluding temperature change) at a point in close proximity to the withdrawal wells." Assuming the proposed project meets these standards, a non-consumptive water right has a relatively high probability of being approved by Ecology.

The proposed water right application (Appendix D) exceeds the 2,250 gallons per minute (gpm) exemption limit, and as such will require submittal of a State Environmental Policy Act (SEPA) checklist. The SEPA process will be conducted upon submittal of the water right application.

The project will also be required to register as a Class V Underground Injection Control well with Ecology. Owners or operators of proposed—or existing—underground injection control wells must register their wells online using the SecureAccess Washington website. All injection wells must either receive a program rule authorization or a state discharge permit in order to operate.

Ecology's Underground Injection Control rule, Chapter 173-218 WAC, authorizes open-loop heat pump/air conditioning (HAC) system wells when a well is registered, and the environmental protection requirements of the rule are met. The following conditions are required to authorize HAC systems in the form of an injection well:

- No chemicals are added to the HAC system
- The HAC system meets water right permitting requirements
- Discharges from wells do not affect the water quality in nearby waters on the 303(d) polluted waters list
- Discharges from wells do not affect the water in nearby waters with a Total Maximum Daily Load (water quality cleanup) plan
- Discharges from wells do not affect groundwater quality by concentrating or redirecting existing contaminant plumes

- Groundwater used in the HAC system must be discharged back to the source aquifer.

EWU will coordinate with Ecology upon water right permit authorization to assure all injection well requirements are met.

## 3.0 HYDROGEOLOGIC ASSESSMENT

Eastern Washington University lies within the Columbia Plateau. Local geology and hydrogeology are dominated by the presence of the CRBG. The CRBG is generally the most consistent source of large groundwater yields required by local water purveyors (Kahle 2011 and GeoEngineers 2015). A site plan that includes surficial geology is presented on Figure 2. A geologic cross section of the EWU campus is presented on Figure 3.

### 3.1 Geologic Setting

The city of Cheney, Washington (Cheney) is located on the northeast margin of the Columbia Plateau, a structural and topographic basin within the drainage of the Columbia River infilled by the CRBG. The CRBG consists of a series of flows, which erupted during the Miocene Epoch about 17 million to 6 million years ago. In the northeast region of the plateau the basalts are relatively undeformed with a gentle southwest slope. In the project area, the CRBG is divided into two basalt units—the Wanapum, and Grande Ronde Formations—and their sedimentary interbeds. Each formation consists of multiple individual flows. The presence of sedimentary interbeds reflect deposition in streams and lakes during periods between the eruption of basalt flows. The CRBG stratigraphically overlays basement rocks that consist of meta-sedimentary rocks of the Precambrian age Belt Supergroup that have undergone low-grade metamorphism during Mesozoic and Tertiary periods. Surface topography is characterized by channeled bedrock, carved by catastrophic glacial floods of the last ice age (Pleistocene time), sediments deposited by glacial flood waters, and wind deposited silts.

The stratigraphic sequence beneath EWU can be generalized as follows:

- Zero to 50 feet below ground surface (ft bgs) of unconsolidated surficial deposits, sand and gravel, and wind-deposited silts
- 50 to 1,300 ft bgs of CRBG
  - 50 to 300 ft bgs, Wanapum Basalt and sedimentary interbeds
  - 300 to 1,000 ft bgs, Grand Ronde Basalt and sedimentary interbeds
- 1,300 ft bgs and below, pre-CRBG basement rock (Kahle 2011, Buchanan 2007, and well log interpretation).<sup>1</sup>

### 3.2 Hydrogeologic Units

All three locally present stratigraphic units described above store water in the project area; however, surficial deposits and the basement rock are not anticipated to produce sufficient yield for a GSHP system. Unconsolidated surficial deposits typically have a saturated thickness of less than 10 ft and are not considered reliable for long term supplies of large quantities of groundwater. The basement rock generally has much lower permeability than the basalts and in most areas of the Columbia Plateau are considered the base of the groundwater flow system (Kahle 2011); however, the basement rock beneath Cheney may be an exception. Cheney Wells 4 and 5 are developed in basement rock aquifer

---

<sup>1</sup> Nearby well logs are presented in Attachment A. Well locations are presented on Figure 2.

with total depths of 2,136 ft and 2,134 ft, respectively, and maximum reported yields of 250 gpm and 750 gpm, respectively (Parametrix 2019).

The CRBG is generally the most consistent source of large groundwater yields in the area and is the focus of this assessment. A more detailed description of the surficial aquifer unit and the basement aquifer unit can be found in Kahle 2011, Buchanan 2007, and GeoEngineers 2015.

### **3.2.1 Columbia River Basalt Group Aquifer**

The CRBG aquifer system is a series of vertically stacked confined or semi-confined basalt aquifers with water yield concentrated at interflow zones (i.e., the zone between two individual basalt flows). Interflow zones include a flow top, a flow bottom, and a sedimentary interbed if present. Interflow structures can include vesicular and/or brecciated flow tops, flow bottom pillow complexes and/or brecciated zones; these features create permeability and storage (Kahle 2011). Water reaches the interflow zones and recharges the aquifers by downward percolation or by lateral groundwater inflow (Luzier and Burt 1974). Movement of groundwater vertically along joints in the basalt is estimated to be several orders of magnitude lower than the horizontal range of movement. Cheney wells 1, 2, 3, 6, and 7 are developed in the CRBG aquifer, as are EWU wells 1 and 2R (Parametrix 2019).

The Grande Ronde Basalt aquifer is considered the most productive basalt aquifer in the project area. The Grande Ronde Basalt aquifer is mostly confined and is recharged to a large degree by lateral groundwater inflow. The overlying Wanapum Basalt aquifer is partially recharged by precipitation and infiltration and is the source of water for many springs and lakes in the Cheney area (Buchanan 2007).

Well logs in and around the EWU campus record a substantial (75- to 100-ft-thick) sedimentary interbed at depths of 500 to 600 ft bgs. Previous hydrogeologic studies have interpreted this layer to be the Latah formation, which is broadly understood to have been deposited between the Wanapum Basalt and the Grande Ronde Basalt (Kahle 2011 and Cheney wellhead protection plan). However, recent geochemical analysis of samples collected from Cheney Well 5 identified the contact between the Wanapum and Grande Ronde Basalts at about elevation 2,200 ft (200 to 300 ft bgs; Buchanan 2007 and GeoEngineers 2015). This depth correlates to an approximate Wanapum Basalt thickness of 220 ft to 280 ft in the EWU campus area.

## **3.3 Aquifer Hydraulic Parameters**

Well testing and hydrogeologic reports were reviewed to estimate hydraulic parameters for the Grande Ronde Basalt aquifer in the vicinity of the EWU campus. Aquifer parameter estimates are summarized in Table 1.

**Table 1. Hydraulic Parameters**

| Model Parameter                                | Value      |
|--|------------|
| Aquifer Transmissivity (square feet per day)   | 9,900      |
| Aquifer Storativity (unitless)                 | 0.0002     |
| Static Water Level (feet below ground surface) | 300 to 400 |
| Hydraulic Gradient                             | 0.01       |

### 3.3.1 Aquifer Transmissivity

Aquifer transmissivity (T) describes the ability of the aquifer to transmit groundwater throughout its entire saturated thickness. Transmissivity is the product of hydraulic conductivity (i.e., the capacity of the aquifer material to transmit water) and aquifer thickness:

$$T = Kb$$

Where K is transmissivity and b is aquifer thickness

Transmissivity can be determined via pumping tests, analysis of aquifer material, or calculations based on laboratory tests. Of these methods, transmissivity values established during pumping tests are typically considered the most accurate. Due to the heterogeneity of hydraulic conductivity in the Grande Ronde Basalt aquifer and variability in saturated aquifer thickness, pumping test data from onsite EWU Well 2R is anticipated to be most representative of local conditions (versus pumping test data from wells at greater distances from campus).

In 2015, pumping tests were completed on a new water supply well (Well 2R) installed on EWU campus. Analysis of the constant-rate pumping test data estimated an aquifer transmissivity range of 9,900 square feet per day (ft<sup>2</sup>/day) to 14,000 ft<sup>2</sup>/day, using the Cooper-Jacob graphical method and the Theis recovery method, respectively (GeoEngineers 2015). For conservatism, the lower transmissivity value was selected for modeling purposes.

The pumping well screen was open to 225 ft of the aquifer, and approximately 100 ft of that interval was estimated to be water-bearing interflow zones. Therefore, for modeling purposes, an aquifer thickness of 100 ft was assumed.

### 3.3.2 Aquifer Storativity

Aquifer storativity (S) is a measure of an aquifer’s ability to store and release water and is defined as the volume of water that a unit will absorb or release from storage per unit surface area per unit change in hydraulic head. Storativity is also known as the storage coefficient; it is dimensionless and is expressed as a decimal. Storativity cannot be estimated from a pumping test without observation well data (testing of Well 2R did not include an observation well[s]), therefore a representative value was selected from

available literature. The estimated median storage coefficient for the Grande Ronde Basalt aquifer is 0.0002 (Kahle 2011).

### 3.3.3 Static Water Level and Hydraulic Gradient

Groundwater levels in the Grande Ronde Basalt aquifer are between about 2,100 and 2,200 ft elevation in the Cheney area (Whiteman 1986) (i.e., between 300 and 400 ft bgs in the EWU campus area). The groundwater flow direction is interpreted to be to the south-southeast with a gradient of 0.01.

During the production well evaluation at Well 2R, completed in 2015, the static groundwater level in the Grande Ronde Basalt aquifer was approximately 350 ft bgs (GeoEngineers 2015). The groundwater level was monitored for a 7-day period under non-pumping conditions. A cyclic fluctuation of 1½ ft was recorded and interpreted to be interference associated with the pumping cycle at Well 1. On a larger timescale, existing historical data indicate that groundwater mining is occurring in the aquifer system beneath the city of Cheney and modeling efforts predict that the rate of water level decline will increase as pumping demands grow with anticipated increases in city population (Buchanan 2007).

Groundwater flow in the CRBG near the Cheney area is generally to the south and southwest, towards the center of the Columbia Basin. However, flow in the Grande Ronde Basalt aquifer in the area of the EWU campus appears to be to the south-southeast due to the presence of a groundwater trough to the southeast of Cheney. Grande Ronde Basalt aquifer groundwater elevation contours are presented in Figure 4 (Whiteman 1986). Groundwater flow direction should be confirmed in the next phase of project design; it is an important design variable for sustaining groundwater temperature targets at the source well.

## 4.0 MODELING

Hydraulic modeling was completed using estimated aquifer parameters discussed above. Three GSHP system options were evaluated:

1. Case Study 1 – Martin-Williamson Hall GSHP System: GSHP system to supply heating and cooling to Martin-Williamson Hall. Consists of one injection well and one extraction well. Preliminary well locations for Case Study 1 are shown on Figure 5A.
2. Case Study 2 – Four Buildings, Micro-District GSHP System: GSHP system to supply heating and cooling to Martin-Williamson Hall, JFK Library, the Computing and Engineering Building and the Art-Theater-Music Complex. Consists of three injection wells and three extraction wells. Preliminary well locations for Case Study 2 are shown on Figure 5B.
3. Case Study 3 – Entire Campus GSHP System: GSHP system to supply heating and cooling to the entire EWU campus. Consists of ten injection wells and ten extraction wells. Preliminary well locations for Case Study 3 are shown on Figure 5C.

Case Study scenarios were presented to Landau by MSI, including associated target system capacity in units of gpm and preliminary design assumptions (e.g., number of wells required, well depth, and well spacing). Hydraulic and thermal modeling was completed to evaluate the feasibility of achieving the necessary well yields to meet system capacity demands and maintain sustainable groundwater temperatures for effective operation of the GSHP system.

### 4.1 Hydraulic Modeling

Drawdown at the extraction well and mounding at the injection well were simulated using the modified nonequilibrium equation (Driscoll 1986) and estimated aquifer parameters presented above.

$$s = \frac{264Q}{T} \log \frac{0.3Tt}{r^2S}$$

Where:  $s$  = drawdown, in ft

$Q$  = pumping rate, in gallons per minute

$T$  = transmissivity, in gallons per day per foot (9,900 ft<sup>2</sup>/day)

$t$  = time since pumping started, in days (1,825 days = 5 years)

$r$  = distance from pumping well, in ft (i.e., well spacing)

$S$  = coefficient of storage (dimensionless; 0.0002)

The drawdown (or mounding) value ( $s$ ) at each well location was calculated for each case study, simulating the effects of combined extraction and injection on the water level in the aquifer. Drawdown in the extraction wells is offset by the return of groundwater through the injections well, which has the opposite effect on the water level than pumping (i.e., raises rather than lowers water levels). Drawdown or mounding analysis does not take into account well efficiency. Well efficiency (drawdown in the well divided by drawdown in the aquifer directly outside the well) is less than 100 percent due to the effect of well loss as water enters or exits the well screen. For the purposes of this evaluation, it may be

assumed that well efficiency would cause drawdown in the wells to be roughly 10 to 20 ft lower (or higher in the case of injection). Model inputs and results are summarized below:

**Table 2. Hydraulic Modeling Results Summary**

|  | Case Study 1 | Case Study 2 | Case Study 3 |
|--|--------------|--------------|--------------|
| Q (gpm)  | 600          | 1,200        | 1,500        |
| r (ft)   | 600          | 500 – 1,600  | 340 – 3,010  |
| Maximum drawdown (s, ft)                                   | 16           | 43           | 87           |
| Maximum mounding (-s, ft)                                  | 16 (7 psi)   | 43 (19 psi)  | 87 (38 psi)  |
| Available water column above pump at maximum drawdown (ft) | 284          | 257          | 213          |

- a. **Note:** Hydraulic head in the Grande Ronde Basalt aquifer in the vicinity of the EWU campus is estimated to be around 350 ft bgs. Available water column is calculated as follows: pump depth minus static water level minus drawdown. Drawdown and mounding values presented do not take into account well efficiency, see discussion in text.

Hydraulic modeling details are included in Appendix B.

## 4.2 Thermal Modeling

Overall anticipated GSHP system performance within the constraints of the site hydrogeologic setting, as described above, was evaluated with numerical groundwater flow and heat transport modeling (thermal modeling). Thermal modeling was completed using a simple 1-layer groundwater transport model using the US Geological Survey (USGS) numerical MODFLOW (for groundwater flow) and MT3DMS (for heat transport) model codes, as accessed via Aquaveo’s Groundwater Modeling System (GMS) software. GMS allows for convenient GIS-based conceptual model setup, conversion to numerical model grid space, and high-quality output graphics to visualize modeling results. The thermal model was set up as a simplified single layer to represent the Grande Ronde Basalt aquifer, with the following key parameters:

- Model grid dimensions (i.e., model domain): approximately 50,000 ft by 45,000 ft—with the EWU campus in the approximate center—or approximately 10 times the general dimensions of the campus (see adjacent graphic), in order to reduce the effect of model boundary conditions on simulated results at the campus location. Model grid cells were set to be 50 ft by 50 ft in the vicinity of campus (i.e., refined to allow for flexibility in extraction and injection well placement as well as to allow for the resulting steeper hydraulic gradients around the wells). The grid was expanded to 1,300 ft by 1,300 ft toward the model boundaries (i.e., expanded to reduce computational needs of the simulations). The model grid was rotated approximately 30 degrees counter-clockwise to allow for convenient assignment of up-gradient and down-gradient hydraulic boundary conditions to represent the general North-Northwest to South-Southeast hydraulic gradient assumed for the campus vicinity.
- The top and bottom of the model were set to a uniform elevation of 2,000 ft and 1,900 ft, respectively; therefore, the model thickness is roughly 100 ft, representing the combined thickness of the basalt interflow zones encountered in Well 2R.
- A uniform hydraulic conductivity of 99 ft per day and a specific storage value of  $2.0 \times 10^{-6} \text{ ft}^{-1}$  (which relates to a storage coefficient value of 0.0002, given an aquifer thickness of 100 ft) were assigned to the model.<sup>2</sup>
- Boundary conditions—both hydraulic and temperature—were assigned to the northwest and southeast edge of the model to simulate background aquifer conditions. The hydraulic boundary conditions were assigned using the specified head (CHD) package in MODFLOW. The resulting background simulated hydraulic conditions in the vicinity of the campus included a simulated head ranging from 2,130 to 2,160 ft with a hydraulic gradient of 0.01 ft per foot. Extraction and injection wells were assigned to the model, in accordance with well layout and pumping rates described for each GSHP case, using the WEL package in MODFLOW.<sup>3</sup> The temperature boundary conditions were assigned to the same up-gradient and down-gradient model boundary cells and assigned to be 286 Kelvin (or about 55 degrees Fahrenheit). Aerial recharge (i.e., from precipitation infiltration) was not applied to the top of the model, with the assumption that vertical percolation of precipitation to the Grande Ronde Basalt aquifer is

<sup>2</sup> Note that, because the flow model was run in steady state (not transient, or time-varying) conditions, the aquifer storage term is not important for model results.

<sup>3</sup> Case 1, with one extraction well and one injection well, extraction and injection rates were assigned 600 gpm for each well; Case 2, with three extraction wells and three injection wells, extraction and injection rates were assigned 1,200 gpm for each well (or 3,600 gpm total extraction and injection); Case 3, with ten extraction wells and ten injection wells, extraction and injection rates were assigned 1,350 gpm for each well (or 13,500 gpm total extraction and injection).

limited. Rather, up-gradient groundwater recharge to the aquifer is implicitly represented by the CHD boundary conditions.

- As described above, background groundwater temperature was assigned 286 Kelvin (or about 55 degrees Fahrenheit). GSHP injection water (with temperature depending on the operational period of the GSHP system) was applied to the injection well(s). Wintertime relatively cool injection water from the GSHP system was assigned a temperature of 279 Kelvin (or about 42.5 degrees Fahrenheit). Summertime relatively warm injection water from the GSHP system was assigned a temperature of 293 Kelvin (or about 67.7 degrees Fahrenheit). Advection, dispersion, conduction, and thermal retardation are the primary heat transport mechanisms represented in MT3DMS. Heat advection was simulated with a third-order total variation diminishing scheme (the default option in GMS). Dispersion was represented in both longitudinal (parallel to groundwater flow, with a dispersivity value of 0.5) and transverse (perpendicular to groundwater flow, with a dispersivity value of 0.1). Conduction was simulated in MT3DMS with the molecular diffusion coefficient of  $2.15 \times 10^{-11}$ . Thermal retardation was calculated using bulk density ( $1,961 \text{ kg/m}^3$ ), sorption coefficient ( $0.00021 \text{ m}^3/\text{kg}$ ), and porosity (0.25) values such that the resulting retardation factor applied to the model was 2.6.
- The MODFLOW groundwater flow model, including simulated hydraulic effect of pumping from the extraction wells and injecting to the injection wells, was set up in steady-state (not time-varying) mode to represent long-term sustained pumping/injecting conditions. The MT3DMS heat transport model, however, was set up in transient mode with daily timesteps, including 10 stress periods representing five repeated annual cycles of cooling/heating operational periods of the GSHP system. Each cycle of cooling/heating periods included 212 days (from October 1 to April 30) of GSHP heating (during which injected water is relatively cool) and 153 days (from May 1 to September 30) of GSHP cooling (during which injected water is relatively warm). Therefore, the thermal model was set up to simulate the heat transport effect on the aquifer from the anticipated operations of the GSHP system over a 5-year period.

Each GSHP case was then evaluated by simulating the extraction and injection wells (via MODFLOW) and heat transport of injected GSHP system water (via MT3DMS) in general accordance with the pumping (extraction/injection) rates and injected water temperatures described above and with well layouts for each case. The results were evaluated by tracking simulated heat in the aquifer over time, both in plan view (i.e., thermal contours across the campus) and in time series (from a representative model cell) formats. The thermal modeling results of each simulated case are presented in Appendix C.

Thermal modeling indicates that a likely temperature effect from the injection wells would be observed at the extraction wells in less than 5 years for all three case studies. This effect consists of an annual fluctuation from warmer than ambient (ambient equal to 286 degrees Kelvin) to cooler than ambient. However, it is likely that the temperature impact would stabilize (reach a maximum impact) in less than 5 years. The maximum temperature impact that was observed was for Case Study 3. At an arbitrary monitoring point within the extraction well array, temperatures fluctuated between about 291 and 280 degrees Kelvin annually. This seasonal pattern stabilized after about 2 years.

## 5.0 WELL DESIGN

For the purposes of cost estimation, MSI requested that Landau establish preliminary well design parameters. Well design parameters are largely based on production well testing of EWU Well 2R and proven well yield. Landau assumes Ecology will require injection wells to reinject into the same aquifer interval as the extraction wells, therefore preliminary injection well design recommendations and preliminary extraction well design recommendations are the same. Design parameters are presented in Table 3 and discussed in the following subsections.

**Table 3. Preliminary Well Design Recommendations (Based on Well 2R construction)**

| Diameter        | 16-inches  |
|-----------------|--|
| Well Depth      | 1,075 ft bgs   |
| Screen interval | 225 ft of screen installed between 677 and 1,075 bgs |
| Depth to Pump   | 650 ft bgs   |

**Note:** Screened interval is within the Grande Ronde Basalt aquifer.

### 5.1 Well Diameter

The recommended extraction and injection well diameter is 16 inches. A 16-inch-diameter well can accommodate a well yield of 800 to 1,800 gpm (Driscoll 1986).

### 5.2 Well Depth and Screen Interval

The recommended well depth and screen interval is 1,145 ft bgs with a 225 ft screen installed between 677 and 1,075 ft bgs.

As a matter of policy, Ecology considers the Wanapum and the Grande Ronde Basalt Formations to be two distinct aquifers. Per WAC Chapters 173-160-181(3) and 173-160-450, water wells may not interconnect aquifers. Ecology typically requires that wells are cased and sealed at least 200 ft into the Grande Ronde Basalt to minimize aquifer interconnection. In the project area, 200 ft into the Grande Ronde Basalt is estimated to be approximately 430 ft bgs. If the well screen interval is 225 ft (approximately the same length as at Well 2R), the minimum well depth would be 665 ft bgs. The maximum well depth would be the estimated depth of the bottom of the Grande Ronde Basalt in this area, which is 1,370 ft. Ultimately, extraction and injection wells would be installed within this range of well depths to intersect sufficient basalt interflow zones to accommodate the design pumping and injection rates. For the purposes of cost estimation, it is recommended the wells target the same depth and screened interval as Well 2R (see Table 3), which discharged 1,300 gpm with only 28 ft of drawdown during a 24-hour constant-rate pumping test.

## 5.3 Pump Depth

Based on the recommended screen placement, the recommended pump depth is approximately 650 ft bgs. The intake of a pump should be placed above the well screen to minimize the risk of distorted flow patterns occurring in the vicinity of the screen, which can result in well fouling and pump damage (Driscoll 1986, Gjengedal et al. 2019). Also, enough water must be present above the pump suction port (i.e., intake) so that the pump remains submerged during groundwater extraction (i.e., anticipated drawdown does not expose the pump). A pump submergence of 20 ft during pumping is typically sufficient for safe operation; however, the pump specification sheet should be reviewed to confirm the pump net positive suction head required (NPSHr). The NPSHr is the minimum pressure at the suction port of the pump required to keep the pump from cavitating.

## 6.0 SUMMARY AND RECOMMENDATIONS

The local Grande Ronde Basalt aquifer appears to have the hydraulic characteristics to support a high yield open-loop GSHP system. Landau's and WNR's analysis of the regulatory environment, hydrogeology and aquifer properties, and thermal modeling efforts indicate that the local aquifer could support system capacity demands for all three case study scenarios presented by MSI. For the next step of project feasibility assessment, well installation and pumping tests should be considered to verify aquifer yields and refine well design and well field configuration.

## 7.0 USE OF THIS REPORT

This report has been prepared for the exclusive use of MSI Engineers for specific application to the Eastern Washington University Ground Source Heat Pump Evaluation project. No other party is entitled to rely on the information, conclusions, and recommendations included in this document without the express written consent of Landau. Further, the reuse of information, conclusions, and recommendations provided herein for extensions of the project or for any other project, without review and authorization by Landau, shall be at the user's sole risk. Landau warrants that within the limitations of scope, schedule, and budget, our services have been provided in a manner consistent with that level of care and skill ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions as this project. Landau makes no other warranty, either express or implied.

WATER WELL REPORT

DEPARTMENT OF ECOLOGY

JAN 30 2013

Notice of Interm No.

WE 32509

Type of Work:

Construction

Decommission  Original installation NOI No.

State of Washington

Department of Ecology Eastern Washington Office

Tag No. BLD 014

Well Name (if not the same as one well):

WELL #3R

Water Right Permit/Certificate No.

G3-22439P/G3-22439C

Property Owner Name

CITY OF CHENEY

Well Street Address

210 ERIE ST

City

CHENEY

County SPOKANE

Tax Parcel No.

131231207

Was a variance approved for this well?  Yes  No

If yes, what was the variance for?

Location (see instructions on page 2):  WWM or  BWM

SW 1/4 of the SW 1/4, Section 12, Township 23N, Range 41E

Latitude (Example: 47.12345)

Longitude (Example: -120.12345)

Proposed Use:  Domestic  Industrial  Municipal  Dewatering  Irrigation  Test Well  Other

Construction Type:  New well  Alteration  Deepening  Other Method:  Driven  Jetted  Cable Tool  Air  Mud-Rotary

Dimensions: Diameter of boring 19" in. to 7.52 ft. Depth of completed well 7.52 ft.

Construction Details table with columns for Casing, Liner, Diameter, From, To, Thickness, Steel, PVC, Welded, Thread.

Perforations:  Yes  No Type of perforator used No. of perforations Size of perforations Performed from ft. to ft. below ground surface

Screens:  Yes  No K-Packer Depth Manufacturer's Name Type Model No.

Sand/Filter pack:  Yes  No Size of pack material Materials placed from ft. to ft.

Surface Seal:  Yes  No To what depth? 444 ft. Material used in seal CEMENT GROUT Did any strata contain tasteable water?  Yes  No Type of water? 5-10 GPM Depth of strata 150-160 FT Method of sealing strata off 16" CASING & CEMENT GROUT

Pump: Manufacturer's Name Type H.P. Pump intake depth ft. Designated flow rate gpm

Water Levels: Land-surface elevation above mean sea level ft. Stick-up of top of well casing 20 ft. above ground surface Static water level 296.5 ft. below top of well casing Date JAN 8/19 Artesian pressure lbs. per square inch Date Artesian water is controlled by (cap, valve, etc.)

Well Tests: Was a pumping test performed?  No  Yes by whom? BSE-NW Yield 1500 gpm with 6.25 ft. drawdown after 24 hrs.

Recovery data (time = zero when pump is turned off - water level measured from well top to water level)

Table with columns: Time, Water Level, Time, Water Level. Rows: 5m, 10m, 15m.

Date of pumping test: JAN 8/19

Boiler test gpm with ft. drawdown after hrs. Air test gpm with stem set ft. for hrs. Date Artesian flow gpm Temperature of water 20.7 F Was a chemical analysis made?  Yes  No

Driller's Log/Construction or Decommission Procedure

Formation: Describe by color, character, size of material and structure, and the kind and nature of the material in each layer penetrated, with at least one entry for each change of information. Use additional sheets if necessary.

Table with columns: Material, From, To. Rows: Top Soil & Old Drill cuttings, Red Clay, Reddish Gray Broken Basalt, Dark Brown Hard Clay, Soft Clay & Broken Basalt, Medium Hard Gray Basalt, Clay & Broken Basalt, Broken Basalt, Clay & Broken Basalt, Red Clay & Broken Basalt, Brown Clay & Broken Basalt, Medium Hard Basalt, Clay & Broken Basalt, Medium Hard Gray Basalt, Medium Hard Broken Basalt, Grayish Brown Soft Broken Basalt (Water 5-10 GPM), Medium Hard Broken Basalt, Hard Gray Basalt, Broken Basalt & Gray Clay, Hard Gray Basalt, Soft Gray Basalt, Hard Gray Basalt, Soft Gray Basalt, Hard Gray Basalt, Medium Hard Gray & Brown Basalt, Hard Gray Basalt, Soft Broken Black Basalt with Green Clay (Water 400-500 GPM).

Start Date SEP 14/18 Completed Date JAN 18/19

WELL CONSTRUCTION CERTIFICATION: I constructed and/or accept responsibility for construction of this well, and its compliance with all Washington well construction standards. Materials used and the information reported above are true to my best knowledge and belief.

NOTE: Multiple symbols are used to indicate borderline or dual soil classifications

### Sampler Symbol Descriptions

|  |                                 |
|--|---------------------------------|
|  | 2.4-inch I.D. split barrel      |
|  | Standard Penetration Test (SPT) |
|  | Shelby tube                     |
|  | Piston                          |
|  | Direct-Push                     |
|  | Bulk or grab                    |
|  | Continuous Coring               |

Blowcount is recorded for driven samplers as the number of blows required to advance sampler 12 inches (or distance noted). See exploration log for hammer weight and drop.

A "P" indicates sampler pushed using the weight of the drill rig.

## ADDITIONAL MATERIAL SYMBOLS

| SYMBOLS |           | TYPICAL DESCRIPTIONS        |
|---------|-----------|-----------------------------|
| GRAPH   | LETTER    |                             |
|         | <b>AC</b> | Asphalt Concrete            |
|         | <b>CC</b> | Cement Concrete             |
|         | <b>CR</b> | Crushed Rock/ Quarry Spalls |
|         | <b>TS</b> | Topsoil/ Forest Duff/Sod    |

### Groundwater Contact

Measured groundwater level in exploration, well, or piezometer

Measured free product in well or piezometer

### Graphic Log Contact

Distinct contact between soil strata or geologic units

Approximate location of soil strata change within a geologic soil unit

### Material Description Contact

Distinct contact between soil strata or geologic units

Approximate location of soil strata change within a geologic soil unit

### Laboratory / Field Tests

|     |  |
|-----|--|
| %F  | Percent fines                          |
| AL  | Atterberg limits                       |
| CA  | Chemical analysis                      |

Case Study 1

Q = 600 gpm

t = 5 years

| Well | s(ft) |
|------|-------|
| EW-1 | 16    |
| IW-1 | -16   |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

Q= pumping rate in gpm

b= 100 ft

T= coefficient of transmissivity of aquifer, in ft<sup>2</sup>/day and gpd/ft

K= 99 ft/day

t= time since pumping test started, in days

S= 0.0002

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

T = 9,900 ft<sup>2</sup>/day

S= coefficient of storage (dimensionless)

T = 74,057 gpd/ft

Q = 600 gpm

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft

Q= pumping rate in gpm (Attenuated over a period of time)

K= 99 ft/day

T= coefficient of transmissivity of aquifer, in gpd/ft

S= 0.0002

t= time since pumping test started, in days

T = 9900 ft<sup>2</sup>/day

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

T = 74,057 gpd/ft

S= coefficient of storage (dimensionless)

Q = 1,200

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

Case 3

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---------|---|----------|-----------------|-------------------------|-----------------------------------|-----------------------|---------------------|--------|--------------------------|-----------------------------|

## Theoretical Drawdown of a Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:

$$s = [264Q/T] * [\log(0.3Tt/r^2S)]$$

Where:

s= drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

b= 100 ft  
K= 99 ft/day  
S= 0.0002  
T = 9900 ft<sup>2</sup>/day  
T = 74,057 gpd/ft  
Q = 1,500 gpm

Q= pumping rate in gpm (Attenuated over a period of time)

T= coefficient of transmissivity of aquifer, in gpd/ft

t= time since pumping test started, in days

r= distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S= coefficient of storage (dimensionless)

| Well ID | Drawdown of Well at a given distance (ft) | Constant | Discharge (GPM) | Transmissivity (GPD/ft) | Time since pumping started (days) | Distance to Well (ft) | Storage Coefficient | 264Q/T | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |

# Thermal Modeling

## APPENDIX C

### THERMAL MODELING

Case Study 1 (in degrees Kelvin)

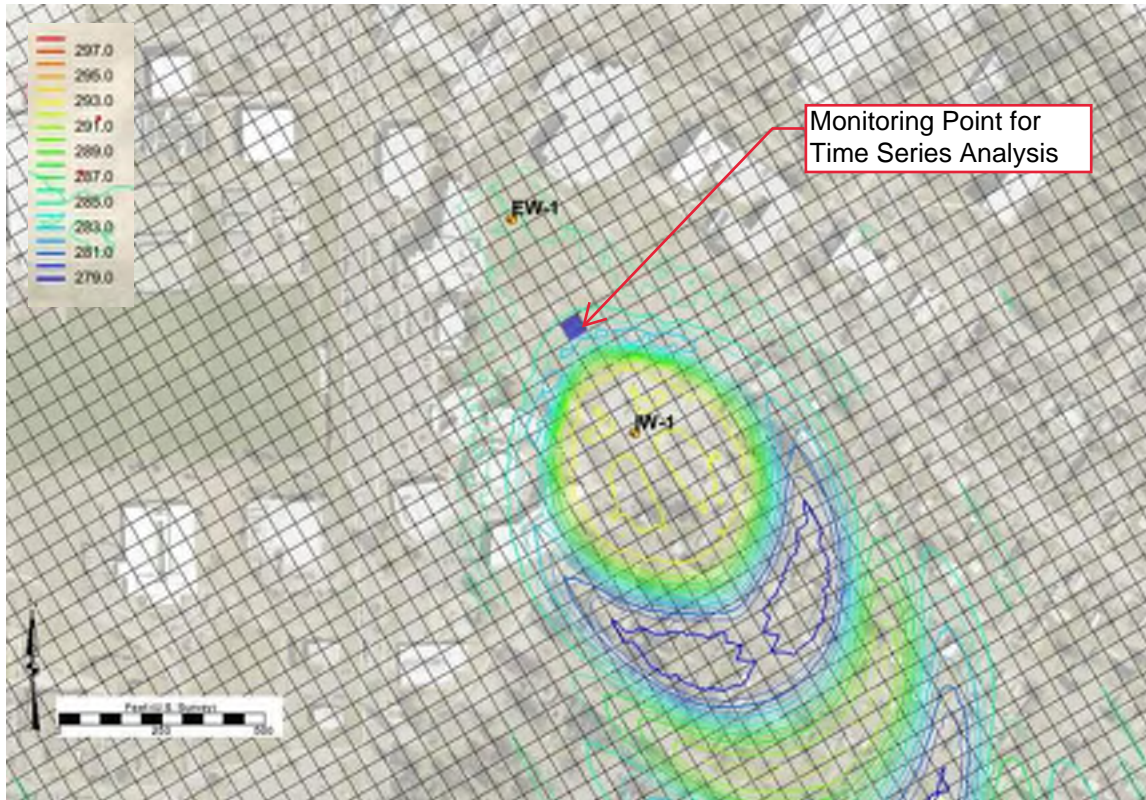

Figure C1. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C2. Timeseries of temperature in a cell in between the EW and IW (blue highlighted cell in the image above – about 300 ft down-gradient of the extraction well).

Case Study 2 (in degrees Kelvin)

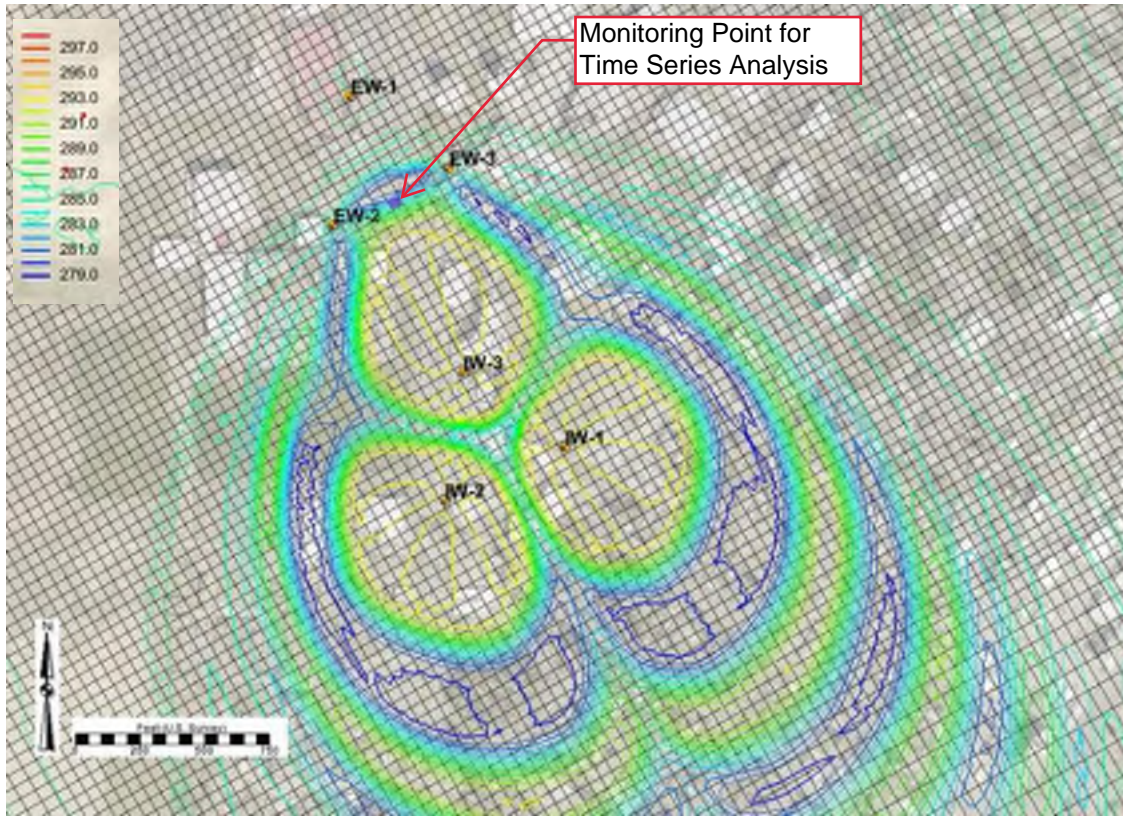

Figure C3. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C4. Timeseries of temperature in a cell in between the EW-2 and EW-3 and IW (blue highlighted cell in the image above).

Case Study 3 (in degrees Kelvin)

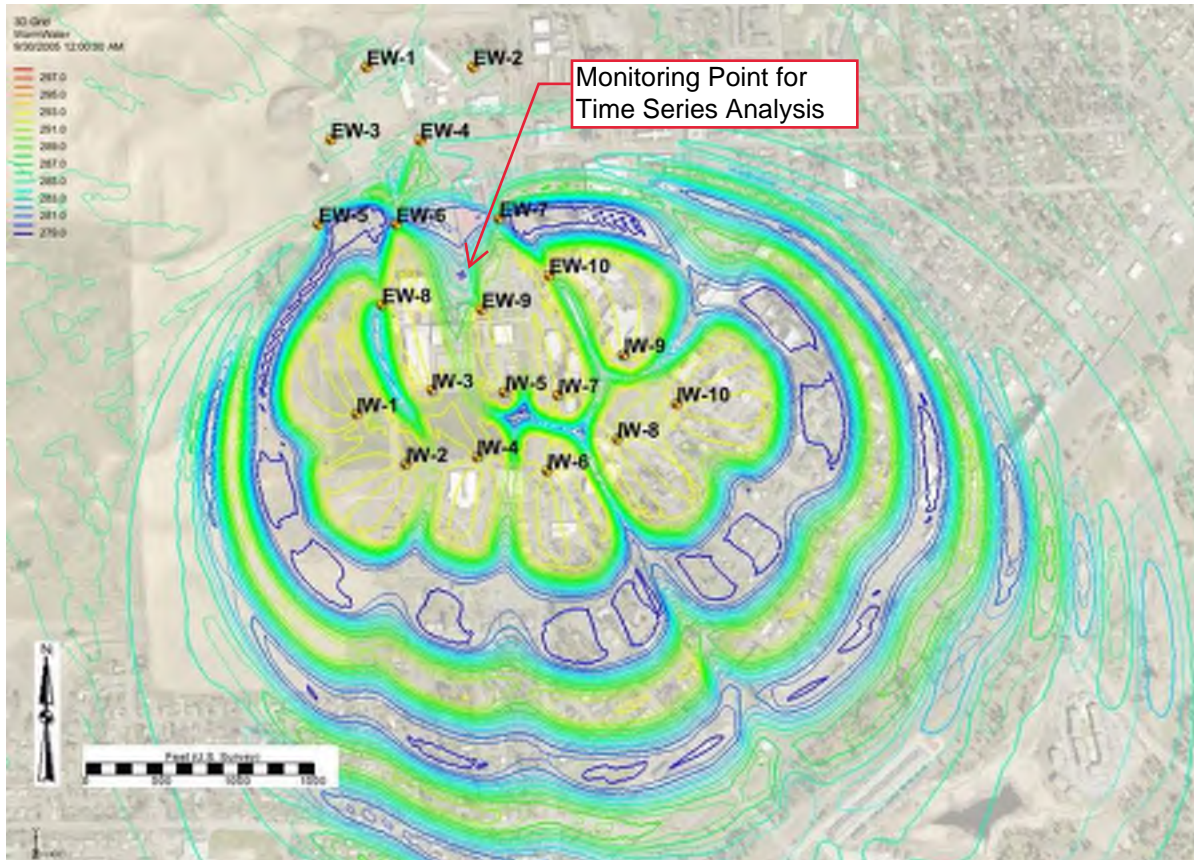

Figure C5. Temperature (Kelvin) at the end of the 5-year simulation.

Figure C6. Timeseries of temperature in a cell in between the EW-6, EW-7, EW-8, EW-9, and EW-10 (blue highlighted cell in the image above).

# Water Right Application

# Application for a New Water Right Permit

Form No. ECY 040-1-14 (Rev 05-2020)

- Refer to accompanying guidance to complete this form.
- We strongly encourage applicants to seek pre-application consultation prior to applying.
- Incomplete applications will be returned.
- All fees are non-refundable (RCW 90.03.470(13)).

## Processing option you are choosing:

|  |   |
|--|---|
| <input checked="" type="checkbox"/> <b>Standard Processing</b><br>(Department of Ecology)            | <input type="checkbox"/> <b>Cost Reimbursement Agreement Processing</b><br>(Ecology Contractor) |
| A minimum \$50 fee is required to apply. Additional fees may apply. Drought applications are exempt. | Contact Department of Ecology to obtain information on this option.                             |

### Submit all applications and fees to:

DEPARTMENT OF ECOLOGY  
 CASHIERING SECTION  
 PO BOX 47611  
 OLYMPIA, WA 98504-7611

Check the box for the region where your project is located.

- Central Region
- Eastern Region
- Northwest Region
- Southwest Region

### ADA Requests

To request ADA accommodation including materials in a format for the visually impaired, call Ecology Water Resources Program at 360-407-6872. People with impaired hearing may call Washington Relay Service at 711. People with speech disability may call TTY at 877-833-6341.

# WATER RESOURCES PROGRAM

## Application for a New Water Right Permit

For Ecology Use  
 (Date Stamp)

**I am applying for a:**

- New groundwater right permit
- New surface water right permit
  
- Short-term water right permit (less than 4 months, non-recurring)  
 Dates the water will be needed:  
 FROM: \_\_\_\_ / \_\_\_\_ / \_\_\_\_  
 TO: \_\_\_\_ / \_\_\_\_ / \_\_\_\_
  
- Cost Reimbursement Processing
- Drought (see Attachment A)

**Required submittals:**

- A \$50 filing fee. This fee is not required for drought or cost reimbursement applications.
- A map showing the proposed point(s) of diversion/withdrawal and place(s) of use.
- A copy of the legal description of property where the water will be used (taken from a real estate contract, property deed, or title insurance policy).
- If platted property, a complete copy of the plat map.

**Date of pre-application consultation with Ecology:** \_\_\_\_\_

**Name of Ecology contact for pre-application:** \_\_\_\_\_

## 2. Project Description

Attach a report with responses to the following required information, and reference the section number in your responses.

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 2.1     | Provide a brief narrative explaining the general nature and intent of the proposed water use.  |              |
| 2.2     | If the proposed water use will include a diversion from a new or permitted reservoir, list any associated water rights, and the means of withdrawal. |              |
| 2.3     | Attach a copy of any SEPA checklists or environmental analyses related to this project with this application.  |              |
| 2.4     | Describe how you will measure and control the rate and volume of your diversion or withdrawal.   |              |

## 3. Purpose(s) and Period of Use

List all purposes for which water will be applied to a beneficial use, and provide the quantity required for each.

| PURPOSE(S) OF USE | RATE (CHECK ONE BOX ONLY)<br><input type="checkbox"/> CFS<br><input checked="" type="checkbox"/> GPM | ACRE-FEET PER YEAR (AF/YR) | PROPOSED NUMBER OF IRRIGATED ACRES | PERIOD OF USE (CONTINUOUS, OR DATES OF PROPOSED USE) |
|-------------------|--|----------------------------|------------------------------------|--|
| Heat Exchange     | 12,000   | 0                          | 0                                  | Continuous   |
| <b>TOTAL:</b>     | 12,000   | 0                          | 0                                  |  |

| Section | Required information  | Reference(s)  |
|---------|---|---------------|
| 3.1     | For domestic water supply systems proposals with <b>fewer than 15 residential connections</b> , provide: <ul style="list-style-type: none"> <li>Projected number of connections to be served</li> <li>Type of connections (e.g., home, recreational cabin)</li> </ul>   |               |
| 3.2     | For domestic water supply systems proposals with <b>more than 15 residential connections</b> , provide: <ul style="list-style-type: none"> <li>Present population to be served water</li> <li>Estimated future population to be served (20 year projection)</li> <li>Whether you have a Water System Plan approved by the Washington State Department of Health, Drinking Water Division, and the date of plan approval.</li> <li>Water System Identification Number</li> <li>Name of water system</li> </ul> | RCW 90.03.015 |
| 3.3     | <b>For stockwater purposes</b> , provide the number of animals and type of stock, and daily water requirements per animal.  |               |

| Section | Required information  | Reference(s)  |
|---------|---|---------------|
| 3.4     | <p><b>For agricultural irrigation</b>, calculate the acreage in which you have a controlling interest, including only:</p> <ul style="list-style-type: none"> <li>• Acreage irrigated under water rights acquired after December 8, 1977,</li> <li>• Acreage proposed to be irrigated under this application, and</li> <li>• Acreage proposed to be irrigated under other pending application(s). Is the combined acreage under existing rights greater than 6,000 acres?</li> <li>• Do you have a controlling interest in a Family Farm Development Permit?</li> </ul> <p>If yes, provide the permit number.</p> | RCW 90.66     |
| 3.5     | <b>For other farm uses</b> , describe all proposed uses.  |               |
| 3.6     | <p><b>For hydropower uses</b>, indicate:</p> <ul style="list-style-type: none"> <li>• Total feet of head</li> <li>• Proposed capacity in kilowatts</li> <li>• Describe works</li> <li>• Indicate all uses to which power is to be applied</li> <li>• FERC License Number</li> </ul>   | RCW 90.03.260 |
| 3.7     | <b>For industrial/mining uses</b> , describe the type of industrial/mining operations, and the method of supplying and utilizing water.   |               |
| 3.8     | <b>For other uses</b> , describe your use in detail.  |               |

## 4. Point(s) of Diversion or Withdrawal Location(s)

Use a separate application for each source (either surface water or groundwater). Attach additional sheets if more than four points of diversion or withdrawal are proposed. Refer to the application guidance document for more information.

Attach additional sheets as necessary.

## 7. Related Water Rights (if applicable)

| Section | Required information  | Reference(s) |
|---------|---|--------------|
| 7.1     | List any other water rights (applications, permits, certificates, or claims) related to this application. Include any rights that overlap the place of use. |              |
| 7.2     | Explain how the water rights listed above have been exercised.  |              |

## 8. System Design and Operation

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 8.1     | Provide a description of the proposed water supply system from the point of diversion or withdrawal to the proposed place of use.  |              |
| 8.2     | Provide preliminary design plans and specifications for the proposed use, including diversion or withdrawal and conveyance facilities, if applicable, and the proposed flow rate and volume design capacity. |              |
| 8.3     | Provide the projected system efficiency.   |              |
| 8.4     | <b>For surface water diversions</b> , describe how your plans comply with WDFW fish screening requirements.  | RCW 77.57    |

## DEVELOPMENT SCHEDULE

| Section | Required information  |  |
|---------|---|--|
| 8.5     | Provide a general timeline that includes the steps needed to begin the project, complete the project, and put the water to full beneficial use. |  |
| 8.6     | Identify and discuss other land-use or environmental permits required and the timeline to obtain those permits.                                 |  |

## 9. Hydrogeologic Analysis

We strongly recommend that applicants consult with Ecology in a pre-application meeting prior to conducting any hydrogeologic work, to determine the scope of data required for processing this application.

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 9.1     | If known, describe the hydrogeologic setting and identify all groundwater bodies and surface water bodies involved.  |              |
| 9.2     | <p>If known, describe:</p> <ul style="list-style-type: none"> <li>• Geographic recharge and discharge areas</li> <li>• Seasonal variations of groundwater elevations</li> <li>• Interrelationships between surface water and groundwater, and between aquifers</li> <li>• Barriers to flow</li> <li>• Hydrologic boundaries</li> </ul>   |              |
| 9.3     | <p>Attach any available well information including:</p> <ul style="list-style-type: none"> <li>• Water well report</li> <li>• Well diameter and depth</li> <li>• Motor and pump specifications (i.e., make, horsepower, and type)</li> <li>• Pump test data</li> <li>• Well locations (must be identified as outlined in Section 11)</li> </ul>  |              |
| 9.4     | <p>If known, describe the following characteristics of the aquifer, and cite the source of that information:</p> <ul style="list-style-type: none"> <li>• Aquifer transmissivity</li> <li>• Aquifer storage coefficient and specific yield</li> <li>• Saturated thickness</li> <li>• Aquitard leakage</li> <li>• A detailed description of groundwater-flow boundaries</li> <li>• Water-level hydrographs for wells</li> <li>• Associated water-quality information</li> </ul> |              |

If your proposed water use impacts or impairs a protected water source or an existing water right, you will need to discuss mitigation options in **Attachment B** with the appropriate regional office.

## 10. Environmental Assessment

| Section | Required information   |  |
|---------|--|--|
| 10.1    | Describe the aquatic uses of any related surface water bodies (i.e., fish and wildlife, recreation and aesthetic, water quality, etc.).  |  |
| 10.2    | Indicate whether the related surface water is fish-bearing, including whether it is inhabited by salmonids. List species and the times of year they are present. <a href="https://apps.wdfw.wa.gov/salmonscape/">https://apps.wdfw.wa.gov/salmonscape/</a> |  |

## 11. Driving Directions

| Section | Required information   | Reference(s) |
|---------|--|--------------|
| 11.1    | Site address, and detailed driving directions to the project site. |              |

## 12. Maps and Other Documentation

| Section | Required information   |  |
|---------|--|--|
| 12.1    | <p>Attach detailed map(s) clearly indicating the following:</p> <ul style="list-style-type: none"> <li>The proposed places of use for all rights related to this application. If any overlapping water rights for the place of use, or multiple rights that share the same point(s) of diversion/withdrawal exist, provide one map depicting all of the historic points of diversion, means of conveyance, and places of use. Identify related rights as such by water right number.</li> <li>The county parcel numbers for the proposed place of use, unless the place of use is for a large service area such as that served by an irrigation district or municipal water system. Identify the name of the irrigation district or the water system, if applicable.</li> <li>The proposed locations of the point(s) of diversion/withdrawal.</li> <li>The names, informal or formal, used to identify each point of diversion/withdrawal (e.g., Well No. 1, River Well, S01, Smith Dam, etc.).</li> <li>A grid layer referencing Section, Township, and Range of the area.</li> <li>The location of the water delivery system and other such features relevant to your proposed application (e.g., mainlines, reservoirs, booster pumps, etc.)</li> </ul> |  |

# Attachment A: Drought Authorizations

**Note:** In order to apply for a new temporary drought permit, applicants must be conducting a previously established activity under a valid water right permit, certificate, or water right claim within an area covered by a formal drought declaration. (WAC 173-166).

Complete this attachment and the following sections of the Application for a New Water Right:

- Sections 1 through 5
- Section 11. Maps and other Documentation

| Section | Required information  | Reference(s)   |
|---------|---|----------------|
| A.1     | Describe the specific circumstances pertaining to your water shortage. Describe how existing water rights are insufficient to address these impacts due to the drought.   |                |
| A.2     | Describe how the water right proposed will address these impacts.   |                |
| A.3     | Have you had any previous drought-specific authorizations for the subject parcels?<br>If yes: <ul style="list-style-type: none"> <li>• What are the Drought Authorization numbers?</li> <li>• Did those former authorizations cause impairment to other water users?</li> </ul> | RCW 43.83B.410 |

## Attachment B: Mitigation Plan

| Section | Required information  | Reference(s)   |
|---------|---|--|
| B.1     | Identify the source of supply for the proposed mitigation water.  |  |
| B.2     | Estimate the consumptive quantity of water for the proposed use. Describe the methodology used to support your estimate.  |  |
| B.3     | Describe how the proposed mitigation would offset the impacts of the proposed withdrawal or diversion.  |  |
| B.4     | Describe the measures that will be taken to ensure mitigation will be maintained for the duration of the water right authorization.   |  |
| B.5     | Provide copies of any agreements between you and other parties regarding mitigation for impacts, if applicable.   |  |
| B.6     | Describe the benefits and costs, including environmental effects, of any water impoundment or other resource management technique that is included as a component of the application.   | RCW 90.03.255<br>RCW 90.44.055                       |
| B.7     | <b><u>For surface water</u></b> , analyze whether there will be any increased water supply from the impoundment or technique, including recharge of groundwater, as a means of making water available or otherwise offsetting diversion impacts.  |  |
| B.8     | <b><u>For groundwater</u></b> , analyze whether there will be any increased water supply from the impoundment or technique, including recharge of groundwater, as a means of making water available or otherwise offsetting the impact of the diversion of surface water.                         |  |
| B.9     | If you intend to offset your new use, describe how and when non-consumptive water returns to groundwater or surface water, and explain how this volume was estimated. Specifically describe how the quantity, timing and location of return flow would change if the proposed permit is approved. | WAC 173-500-050(5)<br>WAC 173-500-050(9)<br>POL 1020 |

Attachment  
EWU Application for Non-Consumptive Water Right  
Proposed Heat Exchange System at EWU Campus

SECTION 2: Project Description

2.1 Brief Narrative

Eastern Washington University (EWU) is evaluating a proposed heat exchange project plan at the EWU campus. This water right application is being submitted to support the non-consumptive use and consists of a phased proposal designed to determine the feasibility and design Ground Source based Heat Pump systems (GSHPs).

The GSHP system proposed by MSI Engineers (engineers under contract to EWU) is an open-loop type system, where groundwater is pumped out of the basalt aquifers, circulated through a heat exchanger, and reinjected back into the earth. Hydraulic and thermal modeling was completed to evaluate hydraulic and thermal capacity of the local aquifer to meet the GHSP demands for each case study (Landau, 2023). Aquifer extraction requires a water right from the Washington Department of Ecology (Ecology) and reinjection requires registration with Ecology's Underground Injection Control program. Permitting considerations are discussed in the appurtenant section below. A detailed discussion of the hydrogeologic assessment, modeling results, well design and recommendations are included in the Landau (2023) report completed for this project.

Closed-loop heat pump systems circulate water through buried piping to exchange heat with the ground, whereas open-loop type systems (Figure 1) pump water directly in and out of the earth, from an available aquifer source. The nature of heat transfer requires closed-loop type systems to utilize a significant number of expensive vertical wells, or large open fields for shallow horizontal loops, whereas open-loop type systems, which use water directly, instead of relying on heat transfer to the earth, only required a few wells. This allows for an economy of both scale and space constraints, especially in the context of a college campus, where open space for multiple wells or heat transfer fields is extremely limited.

The evaluation to be completed at the EWU facility is planned to be undertaken in a phased approach, with the three case studies described below. This application is being submitted assuming the project will continue to full buildout throughout the university. Should the project plans be modified during feasibility and/or construction activities, the application may be modified during development or at the proof of appropriation phase. The three case studies for the project are:

**CASE STUDY – 1: MARTIN-WILLIAMSON HALL GSHP SYSTEM**

The first case to be studied is based around the upcoming project involving the remodel and retrofit of the existing Martin-Williamson Hall facility. Because the existing, aging, HVAC system in Martin-Williamson Hall will be replaced with an entirely new, modern HVAC system, the application of a possible GSHP based system is easy to propose. This phase will require one 16-inch extraction well and one 16-inch injection well. Proposed Qi for the first phase is 600 gpm.

### **CASE STUDY – 2: FOUR (4) BUILDINGS – MICRO-DISTRICT GSHP SYSTEM**

Then, considering the initial M-W case as a likely starting point for the campus transition to GSHP based systems, the nearby buildings that include the JFK Library, the Computing and Engineering Building (CEB) and the Art-Theater-Music (ART) complex, were chosen as part of a so-called Micro-District Heat Transfer Center, under the second case study. This would be a facility where the proposed several open-loop system source wells would deliver the ground water to heat exchangers for the building heat pump systems before the ground water was returned to the ground via the reinjection wells. This phase will require three 16-inch extraction wells and three 16-inch injection wells. Proposed  $Q_i$  for the second phase is 3,600 gpm.

### **CASE STUDY – 3: ENTIRE CAMPUS – GSHP SYSTEMS**

The third, and final, case study would provide a large network of source and reinjection wells, serving multiple micro-district heat transfer centers sprinkled around the campus, to support the entire campus using GSHP systems. This would be the upper boundary case in converting the whole campus to be conditioned by open-loop ground-source type heat pump systems. This phase will require ten 16-inch extraction well and ten 16-inch injection well. Proposed  $Q_i$  for the full campus buildout phase is 12,000 gpm.

Figure 1: Generalized Schematic of Open Loop System.

## 2.2 Diversion and Other Water Rights

The proposed project will not include a diversion from a new or permitted reservoir. The project area is currently within the boundaries of the EWU Water System Service area. Water supplied to the municipal water system is provided by two wells as shown on Figure 2. This service area currently utilizes three water rights. These include:

**Table 1: Summary EWU Existing Water Rights**

| Water Right No. | Type        | Priority  | Type        | Qi (gpm) | Qa (AF) | Irr. Ac. |
|-----------------|-------------|-----------|-------------|----------|---------|----------|
| G3-*09810CWRIS  | groundwater | 9/19/1968 | Certificate | 200      | 162     | --       |
| G3-25018C       | groundwater | 8/9/1976  | Certificate | 150      | 200     | 125      |
| G3-27882C       | groundwater | 5/28/1996 | Certificate | 550      | 520     | 125      |

Note: Water rights above have a provision that the total amount of water authorized for withdrawal under Groundwater Certificates No. 7218-A, G3-25018C and G3-27882C is limited to 900 gallons per minute and 922 acre-feet per year.

This proposal is independent of the three existing water rights currently owed by EWU. These water rights are currently undergoing a proof of appropriation and/or conforming documents for the rights.

## 2.3 SEPA

A SEPA determination evaluates if a proposed water right diversion will cause significant adverse environmental impacts. A SEPA threshold determination is required for:

- Surface water applications for more than 1 cubic feet per second (cfs). For agricultural irrigation, the threshold increases to 50 cfs, if the project isn't receiving public subsidies.
- Groundwater applications requesting more than 2,250 gpm.
- Projects with several water right applications where the combined diversions meet the conditions listed above.
- Projects subject to SEPA for other reasons.
- Applications that are part of several exempt actions that collectively trigger SEPA under WAC 197-11-305.

A SEPA will be required under this application. The SEPA will be completed upon final submittal of this application.

## 2.4 Measuring

The groundwater withdrawal will be measured by a dedicated meter at each of the well heads. Pumping rate and quantity withdrawn and injected will be recorded weekly.

## SECTION 3: Purpose and Period of Use

3.1 – Not Applicable

3.2 – EWU water system has a DOH approved water system plan (WSP) for Water System ID# 21900. This project is proposed to be independent of those water rights.

3.3 - Not Applicable

3.4 – Not Applicable

3.5 – Not Applicable

3.6 – Not Applicable

3.7 – Industrial Use of Water

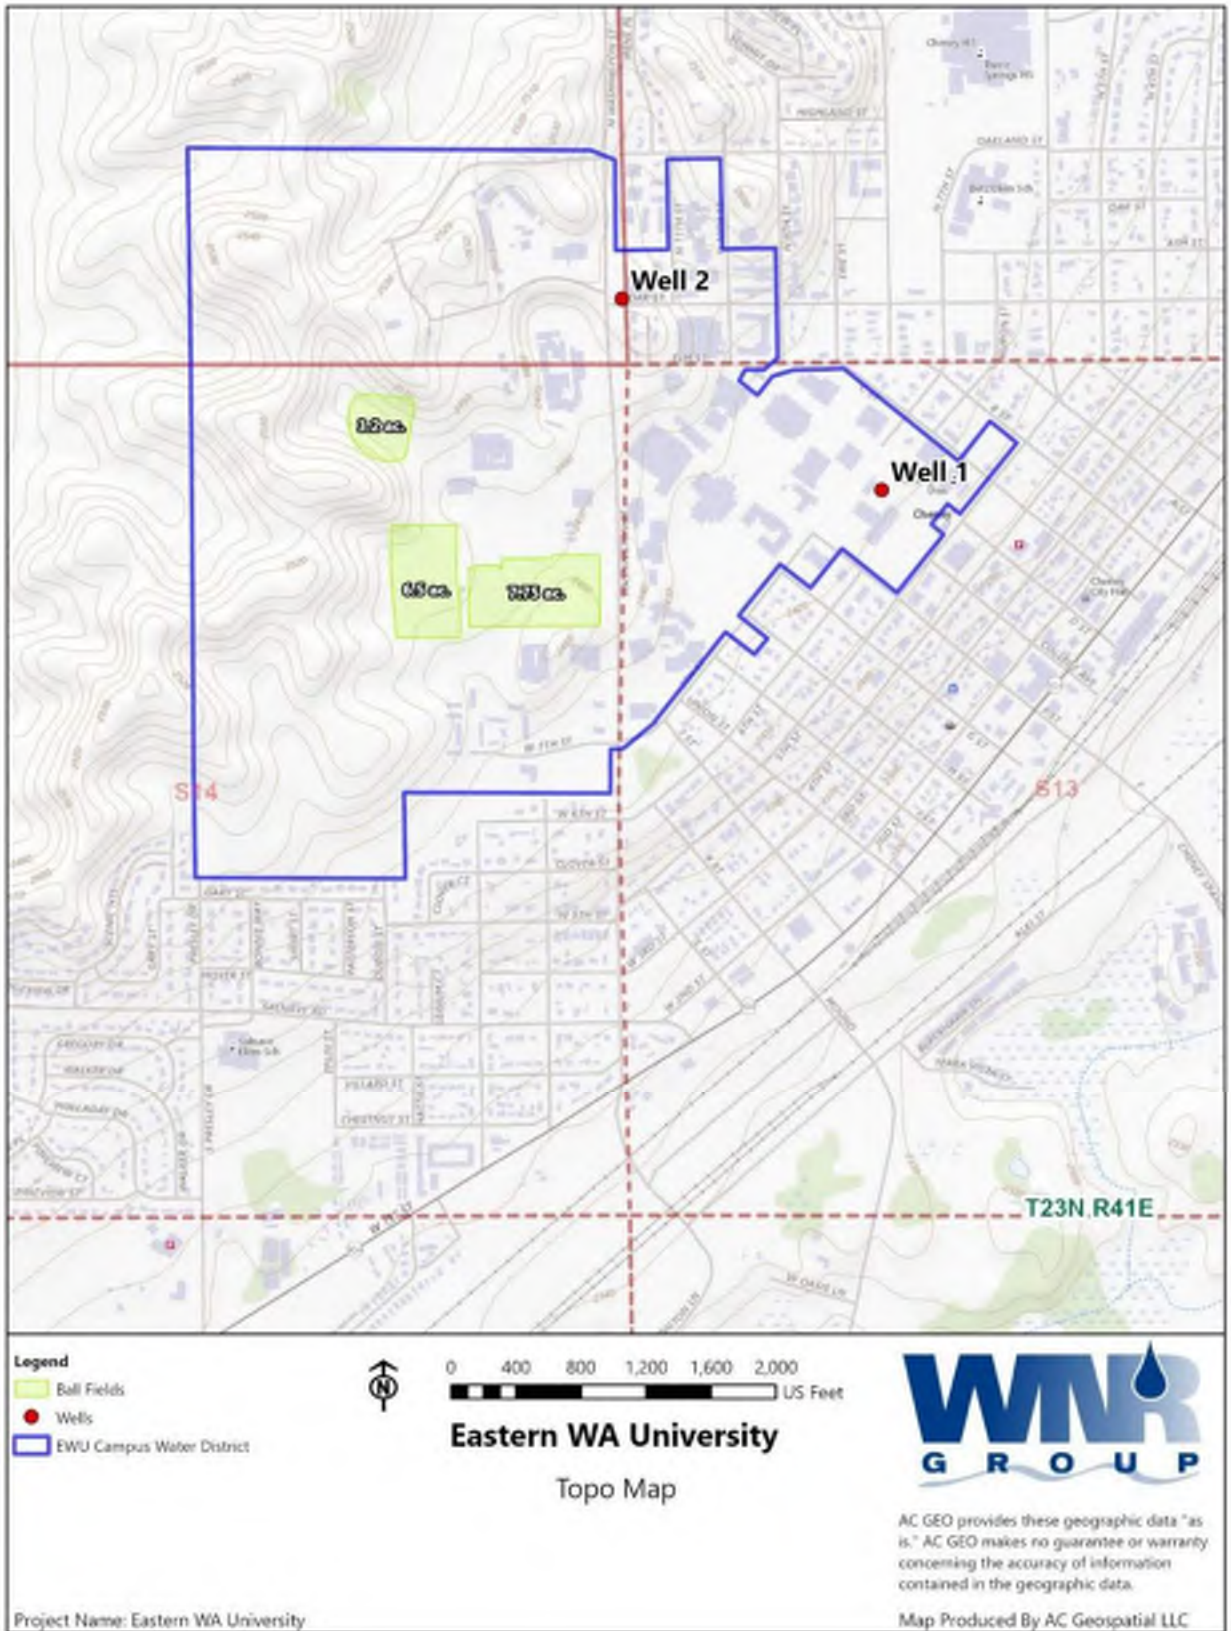

Figure 2: Location of existing municipal wells for EWU service area.

### 3.8 – Description of Use

The primary goal of this project is to provide EWU with information on a possible pathway to reducing fossil fuel use at the existing campus central heating (and cooling) plant, with the ultimate goal of achieving an Energy Efficient, Zero-Carbon campus. As such it will be looking at the availability of, and characteristics of, the existing aquifer water within the Grande Ronde aquifer beneath the EWU campus. The proposed use is using this ground water for the purpose of heating and/or cooling the EWU campus buildings, as this aquifer acts as a heat-source or heat-sink for efficient operation of ground-source heat pump systems. A ground-source heat pump system is an electric energy-based heating and cooling system, rather than a fossil fuel based system, which uses the earth as a source of stable “energy” for extracting or rejecting heat to (i.e., heat sink or heat source), for the purpose of heating or cooling buildings. Although there are other possible heat pump based systems that utilize the ambient outdoor air, rather than the earth, as the heat source or heat sink, using the earth is considered more efficient, since the thermal mass is much more dense than air, and the typical 50 to 60 deg. F ground temperatures are also more stable than the air, which can vary well over 100 deg. F throughout the seasons.

The heat exchange process calls for pumping water from the proposed source (extraction) wells, passing it through a heat pump exchange unit, for the purpose of heat generation, and then injecting it back into the ground through the proposed injection wells, currently planned at approximately a 600-foot spacing. The intent is to have the full discharge from the heat exchange system return to the source aquifer within a short time of being withdrawn. By doing this, the purpose is considered a non-consumptive use. The standard for the project is for the water to be returned to the same aquifer location from which it was withdrawn without any changes to its chemical content. The project will also require approval through the Underground Injection Control registration, discussed later in this document.

The use of water is proposed for heat exchange purposes and is defined in statute as a beneficial use (RCW 90.54.020(1)) and Ecology Policy-2020. The use is defined as a non-consumptive use.

#### SECTION 5: Water Storage

5.1 – Not Applicable

5.2 – Not Applicable

5.3 – Not Applicable

#### SECTION 6

The proposed Heat Exchange project is being evaluated for use within the boundaries of the EWU Water System area. However, the Heat Exchange program will be operated independently of the water supply system currently in use for the university.

#### SECTION 7 – Related Water Rights

7.1 - The EWU facility is currently developing the change to their three water rights shown in Table 1. These three rights are primarily used for municipal water supply and irrigation on the campus. The WNR Group also conducted a screen of the Ecology WRTS database to determine what water rights were within a ½-mile radius of the boundaries of the EWU service area. These results are shown in Table 2 and on Figure 3.

TABLE 2 – WATE RIGHTS AT AND WITHIN ½-MILE OF EWU WSA BOUNDARY

| Water Right No. | Type        | Priority Date | Wtr Rgt Type | Qi (gpm) | Qa (AF/yr) | Irrigated Area Quantity | Purpose Of Use Type Codes   | Name on Certificate           |
|-----------------|-------------|---------------|--------------|----------|------------|-------------------------|-----------------------------|-------------------------------|
| G3-*09810CWRIS  | groundwater | 9/19/1968     | Certificate  | 200      | 162        | --                      | CI, CDS                     | Eastern Washington University |

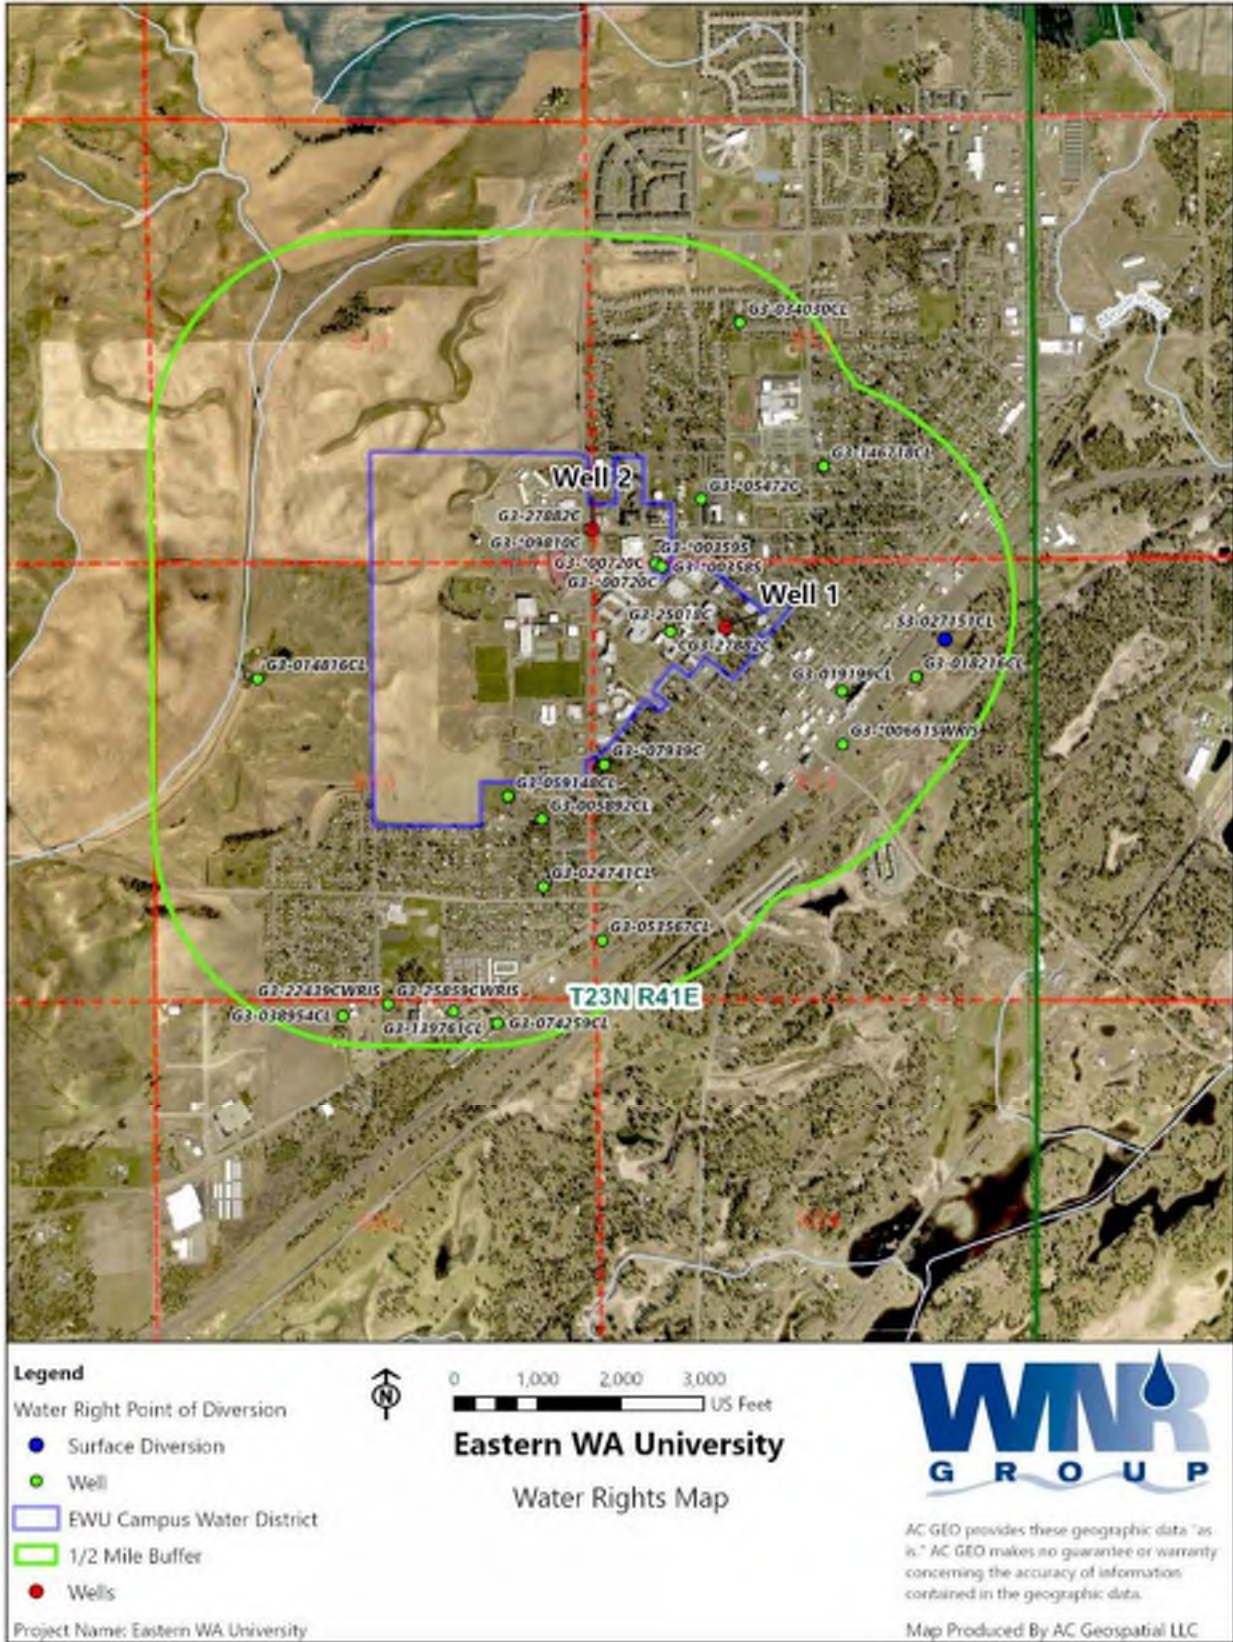

FIGURE 3: Map showing location of water rights within 1/2-mile of EWU Service Area boundaries.

As shown on Table 2, EWU utilizes three water rights within their service area. The City of Cheney also utilizes nine water rights for their water system area. Although the water system areas do not overlap, the City does operate wells within the boundaries of EWU's service area. Outside of the two municipal water purveyors, no other certificates are located within ½-mile of the boundaries of EWU service area. Twelve groundwater and one surface water claims are within ½-mile of the EWU service area as shown in the water right summary Table 2. These claims are all for domestic water use with irrigation less than half an acre and stock watering. Review of well logs show that these small water uses are primarily using water from the shallow Wanapum formation and do not have wells completed into the deeper Grande Ronde aquifer like EWU and the City of Cheney. In addition, all but one of these Claims are located down or cross-gradient of the proposed heat exchange groundwater extraction wells.

7.2 – Water rights currently owned by EWU have been exercised to provide domestic and municipal use within the EWU water service area. Groundwater is also used for irrigation on sports fields around the campus, and for building land scaping and lawn irrigation throughout the campus. EWU is currently undergoing the CWRE evaluation for the proof of appropriation of the changes to these rights and completion of the conforming documents to change the water rights to municipal use. The water right being submitted under this request will be operated independently of the existing water rights and develop its own extraction and injection wells. No shared wells will be utilized under this request and the existing rights.

#### SECTION 8 System Design and Operation

The system design and operation are discussed in detail in the MSI Engineers GSHP Feasibility Report (MSI, 2023) and the Landau Groundwater Temperature Modeling Report (2023). Final design and operations will be based on any results of the feasibility phase of this project.

As discussed previously, three phases are proposed for this GSHP project. Preliminary modelling results completed by Landau (2023) have tentatively determined the proposed place of withdrawal of 10 wells and the proposed placement of ten injection wells. The following figures (4a, 4b and 4c) outline the location of the proposed extraction wells and accompanying proposed injection wells for each of the three phases discussed previously. These locations correspond to the 20 proposed wells included within this application.

### 8.5 Timeline

The timeline on this project will be defined by funding alternatives of the project. Initiation of the first phase of the project, to include the initial extraction and injection well is tentatively projected to be initiated by 2026. Full completion of the project through phase 3 may extend up to 10 years.

### 8.6 Other Permits

The project will first require a water right permit for the GSHP. Typically, new water right applications are acted upon in the order which they are received by the Department of Ecology, who assigns their priority date. Certain new water right applications are granted priority processing dependent upon certain proposed project requirements and conditions. Under WAC 173-152-050(2), an application may be priority processed if Ecology determines that: “the proposed water use is non-consumptive and if approved would substantially enhance or protect the quality of the natural environment (WAC 173-152-050(2)(b)). Ecology also has Policy 2020 – Priority Processing of Heat Pump Applications”. This policy also states that a withdrawal for heat exchange purposes may be afforded priority processing if the conditions under WAC 173-152-050(2)(b) are met.

Ecology Policy 1020 governs determination of consumptive vs. non-consumptive water use. The policy defines groundwater use as non-consumptive when “there is no diminishment of the source.” As proposed with this project, the groundwater withdrawn for the GSHP will immediately be injected back to the source “in the same quantity and quality (excluding temperature change) at a point in close proximity to the withdrawal wells. As shown previously in this document, this proposed project meets these standards.

The EWU GSHP proposed open-loop heat exchange system meets the criteria set forth in WAC 173-152-050(2)(b) and as such, Ecology should afford it a priority processing status.

As discussed previously, the proposed water right application exceeds the 2,250-gpm limit, and as such will require submitting the SEPA checklist. The SEPA process will be conducted upon submittal of the water right application.

The project will also be required to register in the “Underground Injection Control Registration” administered by Ecology. Owners or operators of proposed — or existing — underground injection control wells must register their wells online using the SecureAccess Washington website. All injection wells must either receive a program rule authorization or a state discharge permit in order to operate. Ecology guidance states that:

Heat pump/air conditioning (HAC) systems return water back into the subsurface groundwater after it has been used to heat or cool a structure by means of an Underground Injection Control (UIC) well — or injection well.

*HAC systems heat or cool buildings by:*

- *Extracting heat energy from groundwater.*
- *Using groundwater as a heat sink (heat is absorbed) when cooling.*

*Ecology's Underground Injection Control rule, Chapter 173-218 WAC, authorizes open-loop HAC system wells when a well is registered and the environmental protection requirements of the rule are met.*

The following conditions are required to authorize HAC systems as an injection well:

- No chemicals are added to the HAC system.
- HAC system meets water right permitting requirements.
- Discharges from wells do not affect the water quality in nearby waters on the 303(d) polluted waters list.
- Discharges from wells do not affect the water in nearby waters with a Total Maximum Daily Load (water quality cleanup) plan.
- Discharges from wells do not affect groundwater quality by concentrating or redirecting existing contaminant plumes.
- Groundwater used in the HAC system must be discharged back to the source aquifer.

EWU will coordinate with Ecology upon water right permit authorization to assure all injection well requirements are met.

#### SECTION 9 HYDROGEOLOGICAL ANALYSIS

9.1 THROUGH 9.4 – For detailed hydrogeologic interpretations, see the Hydrogeologic Report's cited in this application. Groundwater use for the proposed project exists in a basalt aquifer at the site. The existing EWU municipal system currently withdraws groundwater from two wells in the Grande Ronde basalt, which will also be the target aquifer for this project.

The WNR Group reviewed the Washington Division of Geology and Earth Resources geologic map for northeastern Washington (1991). The geologic map (Figure 5) revealed that the new and proposed sites are underlain by Miocene Wanapum basalts (Mvw) which overlie the deeper Grand Ronde basalt. The Columbia River Basalt Group, of which the Wanapum and Grande Ronde are members, represent a vast outpouring of basaltic lava flows from vents in eastern Oregon and southwestern Washington and Idaho from about 17 to 6 million years ago (Johnson et al, 1998). The two units exposed in Spokane County (Wanapum and Grande Ronde), were erupted from vents in Idaho and flowed to the Pacific Ocean. The Wanapum and Grande Ronde primarily consist of a black to dark gray fine-grained (Grande Ronde) to coarse-grained (Wanapum), basalt (Johnson et al, 1998). These units typically host multiple aquifers in the interflows or where they are heavily fractured.

The stratigraphic sequence beneath EWU can be generalized as follows (in feet below ground surface):

- Zero to 50 feet of unconsolidated surficial deposits; sand and gravel and wind-deposited silts.
- 50 – 1,300 feet of CRBG,
  - 50 – 300 ft, Wanapum basalt unit and sedimentary interbeds
  - 300 – 1,000 ft, Grand Ronde basalt unit and sedimentary interbeds
- 1,300 feet and below, Pre-CRBG basement rock (Kahle 2011, Buchanan 2007, and well log interpretation).

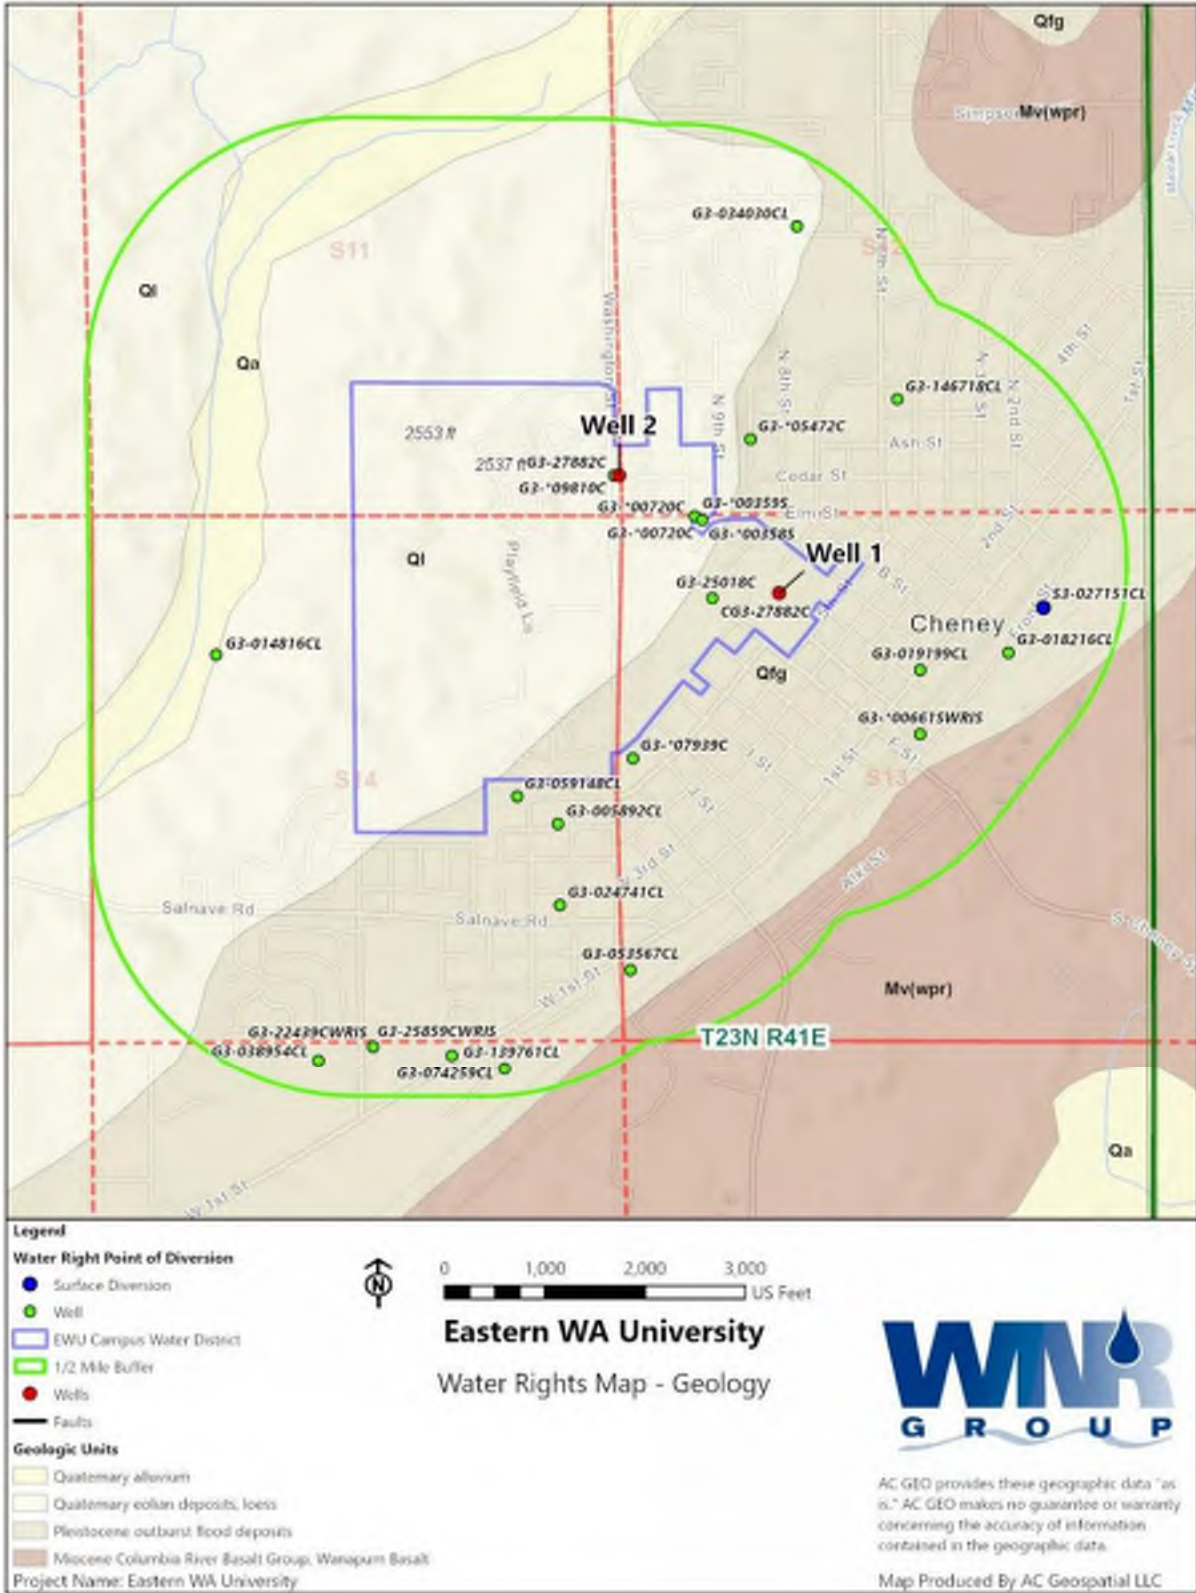

Figure 5: Geologic Map of the area around EWU

The following is presented from an Ecology Memo dated March 13, 2008 which described the hydrogeologic conditions for a proposed change to the City of Cheney water rights.

The area is underlain by the Columbia River Basalt Group, of which there are two major zones of public groundwater: the unconsolidated zone, and the basalt. The unconsolidated zone extends from the land surface down to the first solid basalt flow. It consists of unconsolidated and weakly consolidated sediments, chiefly sands, and gravels.

The basalt zone is part of a large groundwater reservoir occurring in a thick series of basalt flows. These flows primarily consist of the Saddle Mountain, Wanapum and Grand Ronde formations. Groundwater is found in a system of interconnected aquifers within the formations of the Columbia River Basalt Group.

The proposed project lies near the margin of the Columbia River Basalt Group. Steptoes consisting of pre-Cenozoic rocks lie to the north of Cheney. Miocene age Wanapum Basalt is exposed to the south and west of Cheney. The Wanapum basalt overlies the older Grand Ronde basalt, and a sedimentary interbed may be present at that contact.

Hydraulic heads indicative of the Grand Ronde aquifer do not necessarily appear at the base of that sedimentary interbed. Often, the hydraulic head does not appear until wells penetrate up to 200 feet into the Grand Ronde basalt. High hydraulic heads, typical of the overlying Wanapum basalt hosted are often closely connected to shallow groundwater.

Groundwater flow in the Cheney area is from SSW to SW with aquifers recharging along the margins of the basement outcrops which are exposed north of Cheney, or through the basin margins for the deeper basalt interflows. No evidence of significant connection to surface water is available.

Research compiled under this study and summarized in Landau (2023) temperature modeling report documents that the principal aquifer in the region is contained within the Columbia Plateau Basalt flows of the Wanapum and Grand Ronde formations. Regionally, these basalt flows erupted over a 10 million year period beginning approximately 16 million years ago. Each individual flow is typically 50 to 100 feet thick. Water migrates laterally through the high permeability interflow zones which are located at the intersection of the top of the underlying basalt flow and the bottom of the overlying basalt flow. The dense, basalt flow interiors typically display vertical hydraulic conductivity values that are orders of magnitude lower than the much higher conductivities of the interflow zones.

The CRBG aquifer system is a series of vertically stacked confined or semi-confined basalt aquifers with water concentrated interflow zones, i.e., the zone between two individual basalt flows. Interflow zones include a flow top, a flow bottom, and a sedimentary interbed if present. Interflow structures can include vesicular and/or brecciated flow tops, flow-bottom pillow complexes and/or brecciated zones, these features create permeability and storage (Kahle 2011). Water reaches the interflow zones and recharges the aquifers by downward percolation or by lateral groundwater inflow (Luzier and Burt 1974). Movement of groundwater vertically along joints in the basalt is estimated to be several orders of magnitude lower than the horizontal range of

movement. City of Cheney wells 1, 2, 3, 6 and 7 are developing in the CRBG aquifer, as are EWU wells 1 and 2R (Parametrix 2019).

The CRBG consists of the Saddle Mountain Basalt unit, Wanapum Basalt unit, and the Grande Ronde Basalt, and their sedimentary interbeds. The Wanapum and the Grande Ronde Basalts are present in the Cheney area, the Wanapum Basalt underlies the Grande Ronde Basalt. The Grande Ronde is the deepest and most-voluminous unit and the most productive basalt aquifer. The Grande Ronde Basalt aquifer is mostly confined and is recharged by lateral groundwater inflow. The Wanapum Basalt aquifer is partially recharged by precipitation and infiltration and is the source of water for many springs and lakes in the Cheney area (Buchanan 2007).

Well logs in and around the EWU campus record a substantial sedimentary interbed at depths of 500-600 feet bgs and a thickness of 75-100 feet. Previous hydrogeologic studies have interpreted this to be the Latah formation, which is broadly understood to have been deposited between the Wanapum Basalt and the Grande Ronde Basalt (Kahle 2011 and City of Cheney wellhead protection plan). However, recent geochemical analysis of samples collected from City of Cheney Well 5 identified the contact between the Wanapum and Grande Ronde Basalts at about elevation 2,200' (200-300 ft bgs) (Buchanan 2007 and GeoEngineers, 2015). This correlates to an approximate Wanapum Basalt thickness of 220 and 280 in the EWU campus area. Locally the Latah formation has been interpreted as a confining layer that restricts groundwater flow based on higher heads in the Wanapum Basalt respective to the Grande Ronde Basalt (Buchanan 2007).

A generalized geologic cross-section beneath the site is presented in Figure 6. The target aquifer for this project will be the lower Grand Ronde basalt Formation.

Figure 6: Generalized Geologic Cross Section in the area of EWU

**Site Groundwater Conditions** – A detailed review of well logs and available hydrogeologic data and reports were conducted for this study. At the Existing subject site, the groundwater within the Grand Ronde member was determined to have the following aquifer characteristics. The Columbia River Basalt Group is a regional aquifer system, and the Grand Ronde Aquifer extends across the basin. The aquifer hydraulic parameters may vary dependent upon the specific geologic conditions at a specific location within the basin. The following are the most representative parameters the project evaluation could develop.

**Aquifer Hydraulic Parameters**

Well testing and hydrogeologic reports were reviewed to estimate hydraulic parameters for the Grande Ronde aquifer in the vicinity of the EWU campus.

**Table 3. Hydraulic Parameters**

| <b>Model Parameter</b>                        | <b>Value</b> |
|---|--------------|
| Aquifer Transmissivity (ft <sup>2</sup> /day) | 9,900        |
| Aquifer Storativity (unitless)                | 0.0002       |
| Static Water Level (ft bgs)                   | 300 – 400    |
| Hydraulic Gradient                            | 0.01         |

**Aquifer Transmissivity**

Aquifer transmissivity (T) describes the ability of the aquifer to transmit groundwater throughout its entire saturated thickness. Transmissivity is the product of hydraulic conductivity (i.e., the capacity of the aquifer material to transmit water) and aquifer thickness:

$$T = Kb$$

Where K is transmissivity and b is aquifer thickness. Transmissivity can be determined via pumping tests, analysis of aquifer material, or calculations based on laboratory tests. Of these methods, transmissivity values established during pumping tests are the most accurate and should reflect the true hydraulic conditions within an aquifer. Due to the heterogeneity of hydraulic conductivity in the Grande Ronde Basalt aquifer and variability in saturated aquifer thickness, pumping test data from onsite EWU Well 2R is anticipated to be most representative of local conditions (versus pumping test data from wells at greater distances from campus).

In 2015, pumping tests were completed on a new water supply well (Well 2R) installed on EWU campus. Analysis of the constant-rate pumping test data estimated an aquifer transmissivity range of 9,900 ft<sup>2</sup>/day to 14,000 ft<sup>2</sup>/day, using the Cooper-Jacob graphical method and the Theis recovery method, respectively (GeoEngineers 2015). For conservatism, the lower transmissivity value was selected for modeling purposes.

The pumping well screen was open to 225-ft of the aquifer, and approximately 100-ft of that interval was water-bearing interflow zones, therefore for modeling purposes an aquifer thickness of 100-ft was used.

### Aquifer Storativity

Aquifer storativity (S) is a measure of an aquifer's ability to store and release water and is defined as the volume of water that a unit will absorb or release from storage per unit surface area per unit change in head. Storativity is also known as the storage coefficient and is typically expressed in units of cubic feet per cubic foot, a dimensionless quantity. Storativity cannot be estimated from a pumping test without observation well data (testing of Well 2R did not include observation wells), therefore, a representative value was selected from available literature. The estimated median storage coefficient for the Grande Ronde unit of the CRBG is 0.0002 (Kahle, 2011).

### Static Water Level and Hydraulic Gradient

Groundwater levels in the Grande Ronde basalt unit are around between 2,100 and 2,200 ft elevation in the Cheney area (Whiteman 1986), i.e., between 300 and 400 ft bgs in the EWU campus area. The groundwater flow direction is interpreted to be to the south-southeast with a gradient of 0.01.

During the production well evaluation at Well 2R, completed in 2015, the static groundwater level in the Grande Ronde Basalt aquifer unit was approximately 350 feet bgs (GeoEngineers 2015). The groundwater level was monitored for a 7-day period under non-pumping conditions. A cyclic fluctuation of 1½ feet was recorded and interpreted to be interference associated with the pumping cycle at Well 1. On a larger timescale, existing historical data indicate that groundwater mining is occurring in the aquifer system beneath the City of Cheney and modeling efforts predict that the rate of water level decline will increase as pumping demands grow with anticipated increases in City population (Buchanan, 2007).

Groundwater levels in the basalt units generally mimic the dip of the basalt, because most groundwater occurs and moves in the interflow zones (Kahle 2011). Groundwater flow in the CRBG near the Cheney area is generally to the south and southwest, towards the center of the Columbia Basin. However, flow in the Grande Ronde Basalt aquifer in the area of the EWU campus appears to be to the south-southeast due to the presence of a groundwater trough to the southeast of Cheney. Grande Ronde groundwater elevation contours are presented in Figure 4 (Whiteman 1986). Groundwater flow direction should be confirmed in the next phase of project design; it is an important design variable for sustaining groundwater temperature targets at the source well.

The altitude of the Grande Ronde Basalt Member (from the USGS WRI Report 87-4238, Sheet Three) for a well in the SE¼ Sec. 11, SW¼ Sec. 12, NW¼ Section 13, or NE¼ of Sec. 14, T. 23 N. R. 41 E.W.M. is approximately 2175'. With a land surface of ~2450', this puts the top of the Grande Ronde at approximately 275' below land surface. The casing call for a well at this site would be estimated at 475' below land surface for a Grande Ronde wells at this location.

To properly construct a well in the Grande Ronde Aquifer, the driller will need to case and seal the well as mentioned above to allow for production from only the Grande Ronde Aquifer. The annular space would need to be a minimum of 4-inches greater than the permanent casing. After the casing is sealed in place, the well may be completed by drilling out of the casing until sufficient

water is obtained. Sealing shall be placed from the bottom of the well to the top until undiluted sealing material returns to the surface.

### Impairment Considerations

Impairment is an adverse impact on the physical availability of water for a beneficial use that is entitled to protection. In order to determine potential impairment, the following Theis non-equilibrium well equation analysis was completed.

In order to determine theoretical drawdown in wells at a given distance from the proposed wells, the Theis non-equilibrium equation (1935), modified by Cooper and Jacob (1946) was used as outlined in Driscoll (1986). The equation allows for the calculation of drawdown at any point away from a well pumping at a constant rate. The equation is presented as:

$$s = [264Q/T] * [\log(0.3Tt/r^2 S)]$$

Where:

**s** = drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate;

**Q** = pumping rate in gpm;

**T** = coefficient of transmissivity of aquifer, in gpd/ft

**t** = time since pumping started, in days;

**r** = distance, in feet, from the center of a pumped well to a point where the drawdown is measured;

**S** = coefficient of storage (dimensionless)

A spreadsheet was developed for the equation and is attached to this memo. The equation was run for a pumping rate for each of the proposed phases (600, 3,600 and 12,000 gpm), with time of pumping at 1, 7, 30, 180, and 365 days, at a distance to observation well of ¼, ½, and 1 mile from a proposed theoretical well. The Thesis non-equilibrium equation generally revealed that a pumping rate of 600 gpm (the maximum amount proposed for each individual extraction well in the system) for 365 days drawdown (decline in hydraulic head) in an observation would be 9.34 feet (1/4-mile), 8.05 feet (1/2-mile), and 6.76 feet (1-mile). At a pumping rate of 3,600 gpm for 365 days, drawdown in an observation would be 56.04 feet (1/4-mile), 48.31 feet (1/2-mile), and 40.59 feet (1-mile).

As the proposed project is non-consumptive, the extracted groundwater will be immediately returned to the aquifer through an injection well within 600 feet of its extraction well. This theoretically creates the same mounding values as that calculated in the drawdown analysis, thus offsetting any drawdown or decline of the hydrostatic head. Figure 7 presents a schematic showing the theoretical effects on the potentiometric head gradient created during an open loop heat exchange system.

Therefore, it is assumed that no impairment to wells in the area may occur. Only the City of Cheney wells located within the EWU service area would be within the radius of influence.

Figure 7: Schematic showing the theoretical drawdown and mounding of an open loop heat exchange project.

## SECTION 10: Environmental Assessment

10.1 – Nearest surface water body: An unnamed intermittent creek which is tributary to Browns Lake is located approximately ½-mile north of the facility. The nearest surface water feature is Ames Lake and is located approximately ¾-mile southwest from the facility. There is no evidence of any significant connection to surface water to the basalt aquifers in the area of the site (Ecology, 2008).

10.2 – The project site is located on the Columbia Basalt Plateau and contains some intermittent water bodies perched on top of the basalts. No known salmonids are located in the immediate area of the facility.

## SECTION 11: Driving Directions

11.1 The site is located at: Eastern Washington University campus in Cheney, WA 99004. The site is located approximately 17-miles southwest of Spokane Washington in Cheney, WA in Spokane County. To get to the site, drive east on I-90 from Spokane approximately 10 miles to Exit 270-Highway 904, Cheney. Continue approximately 4 miles south on Highway 904 until entering the City of Cheney. Upon entering Cheney, turn right (west) on Betz Road, and after a mile it will bend to the left (heading south) and becomes Washington Street. Drive approximately one mile to the site location.

## Section 12: Maps and Other Documentation

12.1 – Various Maps are included in this document

# Theoretical Drawdown of A Well at a Given Distance and a Constant Pumping Rate Using Theis Nonequilibrium Well Equation (Driscoll, F.G., 1986: Groundwater and Wells)

Equation:  $s = [264Q/T] * [\log(0.3Tt/r^2S)]$

Where: s = drawdown, in feet, at any point in the vicinity of a well discharging at a constant rate

Q = pumping rate in gpm

T = coefficient of transmissivity of aquifer, in gpd/ft

t = time since pumping started, in days

r = distance, in feet, from the center of a pumped well to a point where the drawdown is measured

S = coefficient of storage (dimensionless)

K and T data derived from GeoEngineers 2015 Report

T= 74056.95

| Drawdown of Well at a given distance (ft) | Constant | Discharge (gpm) | Transmissivity (gpd/ft) | Time since pumping started (days) | Distance to Well (feet) | Storage Coefficient | 264Q/T   | (0.3Tt/r <sup>2</sup> S) | log(0.3Tt/r <sup>2</sup> S) |
|---|----------|-----------------|-------------------------|-----------------------------------|-------------------------|---------------------|----------|--------------------------|-----------------------------|

# SECTION 2

## APPENDICES

# EWU Campus Hydro-Geological Assessment

Open-Loop Ground-Source  
Heat Pump Feasibility Study

**Eastern Washington University**

Cheney, WA

January 08, 2024

FINAL REPORT

# Background

## PURPOSE

This report provides the technical, economic, environmental and regulatory assessment of utilizing the existing Grande Ronde aquifer, present deep below the Eastern Washington University campus in Cheney, WA, for the feasibility and economic viability of converting the university’s district heating and cooling system to Ground-Source based Heat Pump systems (GSHPs).

## GOAL

The primary goal of this report is to provide EWU with information on one possible pathway to reducing fossil fuel use at the existing campus central heating (and cooling) plant, with the ultimate goal of achieving an Energy Efficient, Zero-Carbon campus.

## “HYDRO-GEOLOGICAL” vs “GEOTHERMAL” ASSESSMENT

### What’s the difference?

The primary distinction between the term “hydro-geological” and “geothermal” is mostly semantics, in that, even though more commonly used in these sorts of studies, the term “geothermal” suggests fairly warm, if not very hot, ground water is present and available. The term “thermal”, suggests abundant heat from the earth for direct heating of buildings (or electric generation) is possible. This, however, is not normally the case, except in certain special and isolated areas, such as Yellowstone Park, areas of California and some other select areas in the West, as well as certain parts of Iceland, Indonesia and the Philippines. Most of these readily available geothermal sources have already been identified and utilized to produce fossil fuel free heating or electrical generation, or both. In the case of EWU, there is really no geothermal, meaning very hot, ground water present or available, which, if it were, would make the transition away from traditional fossil fuel based heating, much more economically viable.

So, for the purposes of this report, the more appropriate term that will be used is “hydro-geological” assessment. As such it will be looking at the availability of, and characteristics of, the existing aquifer (hydro) ground (geological) water that is present in the earth beneath the EWU campus. The feasibility of using this ground water for the purpose of heating and/or cooling the EWU campus buildings, as this aquifer acts as a heat-source or heat-sink for efficient operation of ground-source heat pump systems, will be analyzed in detail.

# Background

## WHAT IS A GROUND-SOURCE HEAT PUMP SYSTEM?

A ground-source heat pump system is an electric energy based heating and cooling system, rather than a fossil fuel based system, that uses the earth as a source of stable “energy” for extracting or rejecting heat to (i.e. heat sink or heat source), for the purpose of heating or cooling buildings. Although there are other possible heat pump based systems that utilize the ambient outdoor air, rather than the earth, as the heat source or heat sink, using the earth is considered more efficient, since the thermal mass is much more dense than air, and the typical 50 to 60 deg. F ground temperatures are also more stable than the air, which can vary well over 100 deg. F throughout the seasons.

## WHY STUDY A GROUND-SOURCE HEAT PUMP SYSTEM?

Because ground-source heat pump systems are powered by electricity, and are considered highly efficient, more so than alternative air-source type heat pumps, they can greatly reduce or eliminate completely, the combustion of fossil fuels on site for the purpose of heating buildings. This, therefore, allows for a potential significant reduction in the emission of greenhouse gases (GHGs) at the campus level.

## WHAT IS THE DIFFERENCE BETWEEN OPEN-LOOP AND CLOSED-LOOP WELLS?

Closed-loop heat pump systems circulate water through buried piping to exchange heat with the ground, whereas open-loop type systems pump water directly in and out of the earth, from an available aquifer source. The nature of heat transfer requires closed-loop type systems to utilize a significant number of expensive vertical wells, or large open fields for shallow horizontal loops, whereas open-loop type systems, which use water directly, instead of relying on heat transfer to the earth, only required a few wells. This allows for an economy of both scale and space constraints, especially in the context of a college campus, where open space for multiple wells or heat transfer fields is extremely limited.

Horizontal configuration of a ground-coupled heat pump system

Configuration of a groundwater heat pump system

Vertical configuration of a ground-coupled heat pump system

# Process and Findings

---

## ASSESSMENT PROCESS

- The groundwater aquifer below the EWU campus, was investigated and characterized by the consulting firms of Landau Associates and WNR Group, Inc, with hydrogeologists having expertise and experience in the nature of Eastern Washington aquifers and water rights.
- Existing literature, available aquifer testing data, and well logs from the Cheney area were used to develop estimates of the aquifer properties, potential well yield, and preliminary well design.
- Based on three theoretical well water use scenarios for the campus GSHP systems, the viability of water extraction and reinjection was estimated, along with possible thermal degradation/migration impacts, in order to establish reasonable well sizes, depths, spacing and pumping requirements.
- The complete and detailed Hydro-Geological Assessment can be found in the Appendix of this report:
  - *Eastern Washington University Ground Source Heat Pump Evaluation, by Landau Associates and WNR Group, dated January 08, 2024.*
- Using the open-loop well design requirements from the above assessment, cost estimates for the three campus system scenarios were developed, in order to help quantify the environmental impact and economic viability of these systems.
- The various well costs were then coupled with cost estimates for installing and operating ground-source heat pump systems in the three campus scenarios that were analyzed. These were then compared against traditional district heating (fossil fuel based) and cooling systems, from the existing Rozell Energy Plant, in order to determine potential reductions greenhouse gas emissions and energy cost savings for GSHP systems.

## ASSESSMENT SUMMARY, FINDINGS and CHALLENGES

- The Grande Rhonde aquifer has sufficient capacity to support open-loop type ground source heat pumps for the purpose of heating and cooling the EWU campus.
- The campus footprint is large enough to accommodate the development of enough extraction and reinjection wells, to transition the entire campus to GSHP based systems.
- Carbon savings could be significant compared to the existing fossil fuel-based district steam heating systems.
- Energy savings for GSHP systems, compared to the existing central energy plant, are tempered by the added, parasitic pumping energy needed for the open-loop well operations.
- Well costs, interconnecting infrastructure costs, and building HVAC retrofit costs required to utilize GSHP systems, will be considerable.
- Transitioning away from a single centralized energy production energy plant to decentralized, multiple, micro-district plants, will have added management, operational and maintenance costs, that are not included in this study.
- Prior to the design and installation of such GSHP systems as discussed in this report, other alternative HVAC systems, such as air-source heat pumps (which have been discussed in other studies) may provide more economical solutions for reducing carbon emissions on the EWU campus, since the costs to develop expensive well fields can be avoided. It is therefore recommended that more detailed analysis of potential GHG reducing HVAC systems and technologies be further evaluated, which compare life cycle costs vs. energy and carbon savings, prior to a final solution being selected.

# Next Steps and Other Considerations

---

## RECOMMENDED NEXT STEPS

- Review and discuss findings presented in this evaluation.
- Review possible alternative approaches or opportunities for carbon reductions on campus.
- Determine if the findings are compelling enough to justify additional, more detailed study, economics evaluation and likely environmental benefits and trade-offs.
- Develop a roadmap/playbook for implementing carbon reduction opportunities, with timelines and cost/budget estimates.
- Identify funding opportunities, including State capital monies, grants, incentives, and rebates.
- Develop a test well in order to validate preliminary hydro-geology expectations and to help better understand costs and challenges for future scalability.
- Develop alternative energy models for the planned Martin-Williamson Complex upgrade, to better understand the cost-benefits of alternative HVAC systems, such as air-source heat pumps, hybrid systems, etc.

## GENERAL COMMENTARY ON GROUND SOURCE HEAT PUMP (GSHP) SYSTEMS

- The application of ground source heat pump (GSHP) systems for building HVAC applications, is attractive from both an energy efficiency and carbon reduction standpoint. Because it can eliminate the use of fossil fuel for building heating, it can achieve the ideal goal of zero-carbon operation.
- Although the costs to drill and develop the required water well networks are significant, the considerable social and environment benefits to such a system, in addition to the current regulatory requirements, make such GSHP systems attractive for further consideration, as a serious and viable option for a significant campus Greenhouse Gas (GHG) reduction strategy.

## OTHER POSSIBLE CARBON REDUCTION STRATEGIES TO STUDY

- Air-Source Heat Pumps: Similar efficiencies to GSHPs most of the time. May requires supplemental heat in extreme weather. Possibly a more economical option.
- Hybrid Systems: Consider adapting/leveraging existing Central Energy Steam and Chilled water systems with building heat pumps, to optimize energy efficiency and cover the extreme weather periods, without oversizing the heat pumps.
- Green Fuels – Bio-diesel, Renewable Natural Gas & Green Hydrogen: Although so-called “Green Fuels” are not commercially viable for EWU, it may be worthy to consider advances in the development of these fuels for future applications.
- Existing Chiller Plant Optimization: Continue ongoing efforts to optimize the performance of the existing central chilled water plant, due to the fact that it is already carbon zero for campus building cooling duty, and is similar in efficiency to the proposed GSHP systems for air conditioning purposes, but without the added costs of developing the expensive well network. Consider the installation of a Thermal Energy Storage Tank, for added efficiency, and to take advantage of likely future time-of-day electric rates.
- Future Zero-Carbon Steam Production Technologies: High Temperature Heat Pumps, tied into ground-source wells as discussed in this report, combined with new generation Steam Compressors, may make it possible in the future to generate high pressure steam, using zero-carbon electric heat pumps, instead of traditional fossil fuels. Europe is leading the way in these technologies, for heavy industries that are looking for carbon-free steam for process uses. Such technologies may provide a possible bridge, as the campus transitions away from district steam heating to distributed heat pumps, but at the present time, these technologies are not widely used or available in the U.S.

# GSHP System Case Studies

## CASE STUDY SELECTION CRITERIA

Three (3) discrete GSHP system options were chosen for this feasibility study. These varied from one facility, to a group of several buildings, to the entire campus. The several scenarios were selected based on the idea of scaling-up the assessment from an individual building and system, as a starting point to determine viability, to a somewhat larger system, comprising a network of several nearby buildings, to the theoretical eventual conversion of the entire campus to a GSHP system.

Proposed well locations were selected to allow for the general NW to SE ground water flow direction in the Grande Rhonde aquifer, so that the reinjection wells were located “down stream” from the extraction wells, so as to minimize thermal break-through (short circuiting) over time.

## CASE STUDY – 1: MARTIN-WILLIAMSON HALL GSHP SYSTEM

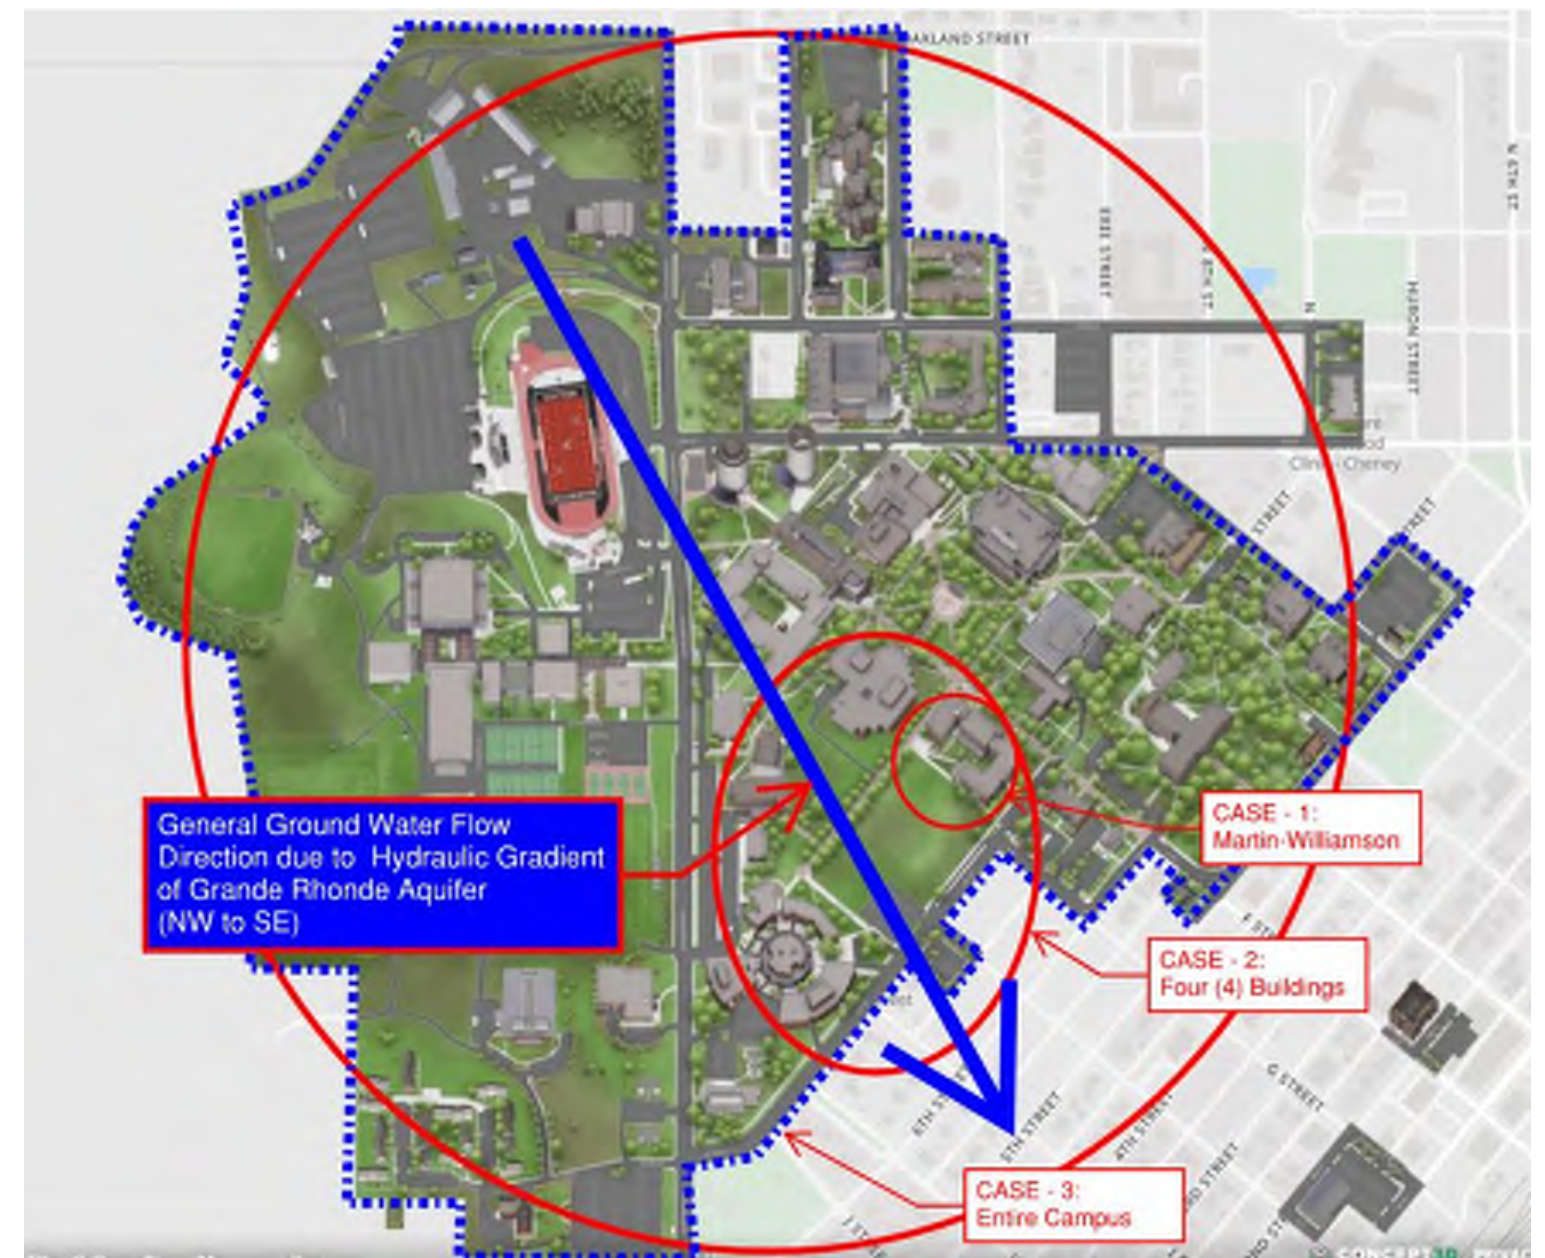

The first case to be study is based around the upcoming project involving the remodel and retrofit of the existing Martin-Williamson Hall facility. Because the existing, aging, HVAC system in Martin-Williamson Hall will be replaced with an entirely new, modern HVAC system, the application of a possible GSHP based system is a practical strategy.

## CASE STUDY – 2: FOUR (4) BUILDINGS – MICRO-DISTRICT GSHP SYSTEM

Then, considering the initial M-W case as a likely starting point for the campus transition to GSHP based systems, the nearby buildings that include the JFK Library, the Computing and Engineering Building (CEB) and the Art-Theater-Music (ART) complex, were chosen as part of a so-called Micro-District Heat Transfer Center, under the second case study. This would be a facility where the proposed several open-loop system source wells would deliver the ground water to heat exchangers for the building heat pump systems, before the ground water was returned to the ground via the reinjection wells.

## CASE STUDY – 3: ENTIRE CAMPUS – GSHP SYSTEMS

The third, and final, case study would provide a large network of source and reinjection wells, serving multiple micro-district heat transfer centers sprinkled around the campus, to support the entire campus using GSHP systems. This would be the upper boundary case in converting the whole campus to be conditioned by open-loop ground-source type heat pump systems.

# Hydro-Geological Assessment | Columbina River Basalt Group (CRBG)

## HYDRAULIC MODELING

## GRANDE RONDE AQUIFER | EXISTING CONDITIONS

Based on analysis by Landau Associates the CRBG aquifer below EWU campus consists of two units, the Wanapum basalt unit and the Grande Ronde basalt unit. The Grande Ronde is the more productive aquifer and is the focus of the hydrogeologic assessment. The following generalizations can be made.

- The CRBG aquifer is present at a depth of approximately 50 to at least 1,300 ft deep.
- It is one of the primary sources for EWU and the City of Cheney.
- The Grande Rhonde portion of the CRBG aquifer is assumed to be confined or semi-confined.
- General regional groundwater flow direction is south.
- Assumed hydraulic gradient: 0.001 to 0.01.
- Estimated transmissivity 9,900 to 1,400 SF/day (Grande Rhonde unit).
- The storage coefficient is assumed to be about 0.0002.

Water rights and impacts to neighboring water users has been reviewed by WNR group. Impairment does not appear to be a project constraint. New water rights for non-consumptive use are therefore likely to be approved.

## HYDRAULIC MODELING RESULTS | DESIGN FACTORS

- The aquifer can supply sufficient water to support each of the three case study scenarios proposed.
- Estimated source well pumping rates: 600 gpm to 1,500 gpm.
- Estimated pumping depths: 650 ft deep.
- Estimated draw-down: 16 ft to 87 ft.
- Recommended well spacing: 600 ft.
- Reinjection pressure: 9 to 41 psi.
- Case-1 can be supported by 1-extraction well and 1-injection well.
- Case-2 can be supported by 3-extraction wells and 3-injection wells.
- Case-3 can be supported by 10-extraction wells and 10-injection wells.

## THERMAL MODELING | THERMAL BREAKTHROUGH ANALYSIS

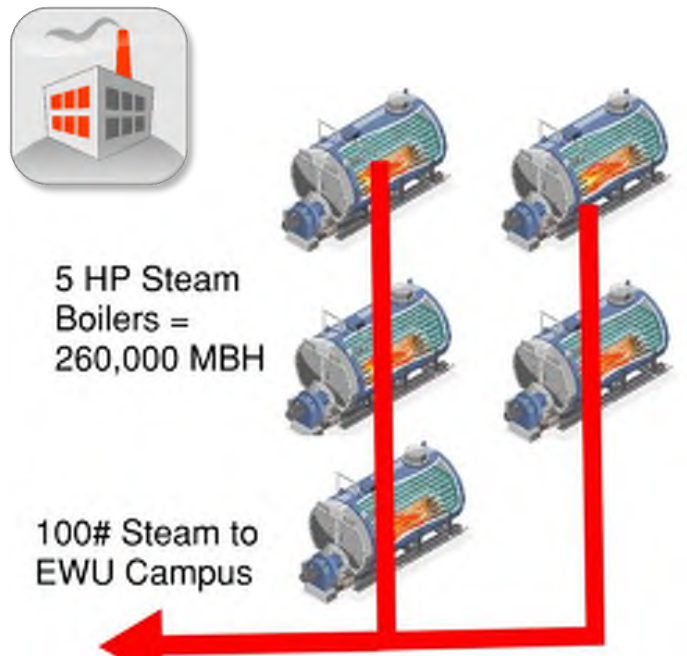

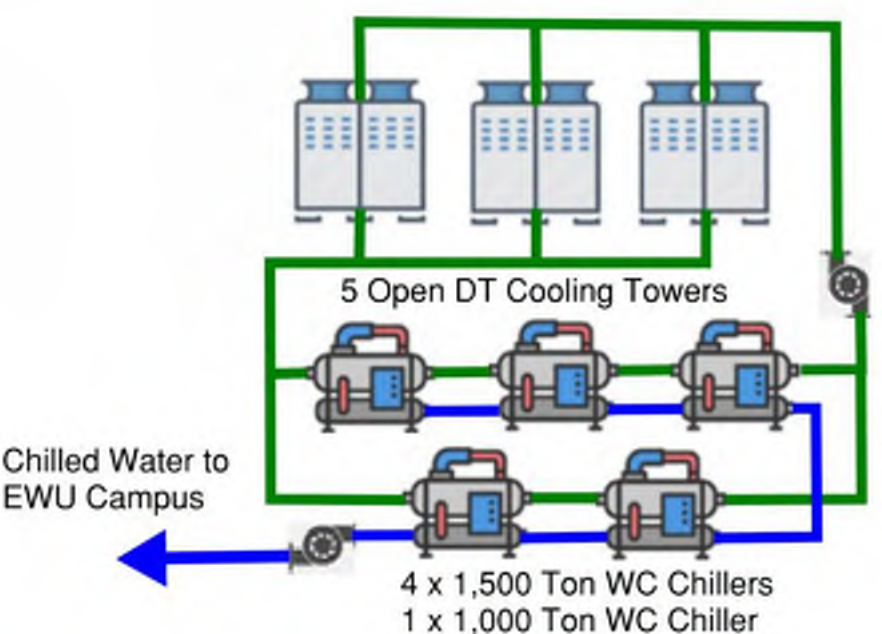

- Simulated well-field operation over time indicates no significant thermal breakthrough of waste heat for the proposed well head spacing and seasonal usages.

# BASELINE CASE | Existing Rozell Central Energy Plant - District Heating & Cooling

|  |  |  |  |
|--|--|--|--|
| <p><b>EXISTING ROZELL CENTRAL ENERGY PLANT</b></p>  <p><b>Campus Heating:</b></p> <ul style="list-style-type: none"> <li>- Five (5) Gas &amp; Oil-Fired High Pressure (100#) Steam Boilers</li> <li>- 260 Klb/Hr Steam Capacity</li> <li>- Assumed Efficiency – 85%</li> </ul> <p><b>Campus Cooling:</b></p> <ul style="list-style-type: none"> <li>- Five (5) Water-Cooled Chillers &amp; Open Draw-Thru Cooling Towers</li> <li>- 7,000 Tons CHW Capacity</li> <li>- Calculated Efficiency – 0.61 kW/Ton</li> </ul> |  <p>5 HP Steam Boilers = 260,000 MBH</p> <p>100# Steam to EWU Campus</p>   |  <p>5 Open DT Cooling Towers</p> <p>4 x 1,500 Ton WC Chillers<br/>1 x 1,000 Ton WC Chiller</p> <p>Chilled Water to EWU Campus</p>   |  <p>EWU - OVERALL UTILITY TUNNEL PLAN</p>   |
| <p><b>2022 EWU Utility Rates</b></p> <ul style="list-style-type: none"> <li>- Electricity (City of Cheney): Consumption Rate: \$0.064/kWh</li> <li>- Natural Gas (AVISTA): Consumption Rate: \$0.994/Therm</li> </ul> <p><b>E-GRID WA STATE CO<sub>2</sub>E FACTORS</b></p> <ul style="list-style-type: none"> <li>- Electricity CO<sub>2</sub>e = 0.44 lb/kWh</li> <li>- Natural Gas CO<sub>2</sub>e = 11.7 lb/Therm</li> </ul>   | <p><b>CAMPUS HEATING</b></p> <p>Heating for the EWU campus is provided by steam produced at the Central Rozell Energy Plant. High Pressure (100 psig) Steam is distributed through a campus-wide network of underground utility tunnels, which then feeds steam into each building. Steam pressure is typically reduced to about 15 psig, for space heating needs and domestic hot water production. Some buildings convert the steam to hot water, for hydronic heating, but most facilities use the steam directly. The steam condensate is pumped back to the central plant to be reused in the heating cycle. Campus heating, due to the cold winter months in eastern Washington, accounts for about 74% of the total central plant energy usage, and about 95% of the carbon emissions. As such the primary focus of this study is to explore opportunities to reduce carbon impacts from the heating plant.</p> | <p><b>CAMPUS COOLING</b></p> <p>Cooling for the EWU campus is provided by chilled water that is produced at the Central Rozell Energy Plant. Five water-cooled chillers and open-type cooling towers produce chilled water at approximately 45 deg. F, which is pumped around the campus through the utility tunnel network. The chiller plant is in the process of several modernization and energy upgrades, including water-side economizers and variable speed chillers and pumps. Winter cooling, when needed for process cooling needs, is provided by a separate dry-cooler unit, with glycol anti-freeze protection. The majority of the campus buildings are cooled (air-conditioned) from the chiller plant, except for most of the residence halls, which are not air conditioned. Chilled water from the plant is typically fed directly into the building's HVAC air handling units, without losses due to intervening heat exchangers.</p> | <p><b>EXISTING CENTRAL PLANT METRICS</b></p> <p><b>Fuel Costs:</b></p> <ul style="list-style-type: none"> <li>Natural Gas/Oil - \$1,988,000/yr</li> <li>Electricity - \$ 241,432/yr</li> </ul> <p><b>Emissions (GHG equivalents):</b></p> <ul style="list-style-type: none"> <li>Natural Gas/Oil – 2,340 Gas Cars/yr</li> <li>Electricity – 152 Gas Cars/yr</li> </ul> <p><b>Overall Campus Energy Density:</b></p> <ul style="list-style-type: none"> <li>Heating EUI – 77 kBtu/sf/yr</li> <li>Cooling EUI – 33 kBtu/sf/yr</li> </ul> |
| <p><b>CENTRAL ENERGY PLANT AREAS SERVED</b></p> <p>Heating ~ 2,600,000 SF<br/>Cooling ~ 2,100,000 SF</p>   | <p><b>CARBON REDUCTION OPPORTUNITIES</b></p> <ul style="list-style-type: none"> <li>- Transition Campus Heating to Heat Pumps (ground or air-source).</li> <li>- Explore hybrid heating systems, such as air-source heat pumps with steam back-up for cold spells.</li> <li>- Add/Expand use of Steam Micro-Turbine Electric Generators (Phase 1 is already being implemented) for “free” site produced power.</li> <li>- Transition to evolving “Green” Fuels, if and when available, such as Renewable Diesel or Renewable Natural Gas. Allows continued use of existing infrastructure.</li> <li>- Explore eventual transition of the Plant to High-Temperature (LP Steam) Heat Pumps and/or Steam Compressors, as these technologies continue to develop. Allows continued use of existing infrastructure.</li> </ul>  | <p><b>CARBON REDUCTION OPPORTUNITIES</b></p> <ul style="list-style-type: none"> <li>- Transition Campus Cooling to Heat Pumps (maximize building heat recovery/sharing opportunities with heating-side operation).</li> <li>- Explore hybrid cooling systems, using building-level heat pumps with simultaneous heat recovery operation, to maximize efficiency during moderate weather, with chiller plant use during peak summer cooling season. Allows continued use of existing infrastructure and highly efficient chiller plant.</li> <li>- Explore opportunities to continue maximize existing chiller plant efficiencies, such as Thermal Energy Storage, Steam-Powered Chillers, etc.</li> </ul>  | <p><b>CARBON REDUCTION CHALLENGES</b></p> <ul style="list-style-type: none"> <li>- Carbon Reduction Costs are very high for these case studies.</li> <li>- Transitions and upgrades/retrofits will take time and be disruptive.</li> <li>- Future costs of energy are uncertain.</li> <li>- Alternative GHG reduction technologies are still emerging. Markets are developing.</li> </ul>  |

# CASE STUDY-1 | Martin-Williamson Hall Complex GSHP System

## GROUND-SOURCE HEAT PUMP (GSHP) SYSTEM HVAC INFRASTRUCTURE:

- Water-to-Water Heat Recovery Chillers (Heat Pumps) – 2 Units
- Heat Exchanger
- Distribution Pumps (To GSHPs)
- Extraction Well Supply Pump
- Underground Piping to and from Well Heads.

### FIRST COSTS:

- Bldg HVAC Systems:  
 90K SF x \$35/sf = **\$3.1M**  
 (Costs for GSHP system components only, other HVAC costs are common to other systems)

## OPEN-LOOP TYPE EXTRACTION & REINJECTION WELL CHARACTERISTICS:

Target System Capacity:

**200 tons**

Ground Water Exchange Flow Rate:

**600 gpm**

Spacing Between Extraction and Reinjection Wells:

**600 ft**

|                   |                   |
|-------------------|-------------------|
| Total Well Depth: | No. of Wells:     |
| <b>1,075 ft</b>   | <b>2 (1-pair)</b> |

|               |                                   |
|---------------|-----------------------------------|
| Pump Depth:   | Average Reinjection Backpressure: |
| <b>650 ft</b> | <b>20 PSI</b>                     |

### FIRST COSTS:

- Wells, Pumps & Piping: **\$3.5M**  
 (\$1.5M per well – Typical)

## PROPOSED OPEN-LOOP WELL LOCATIONS:

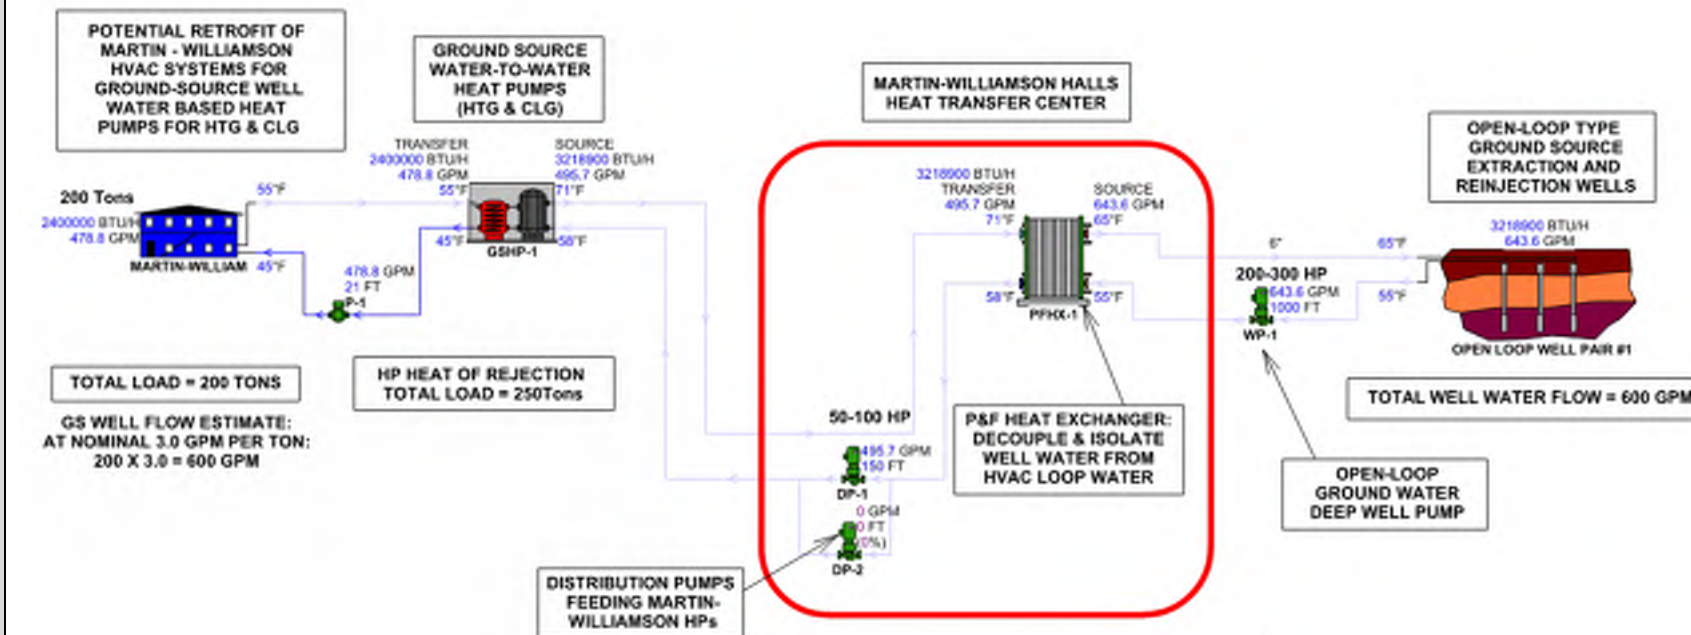

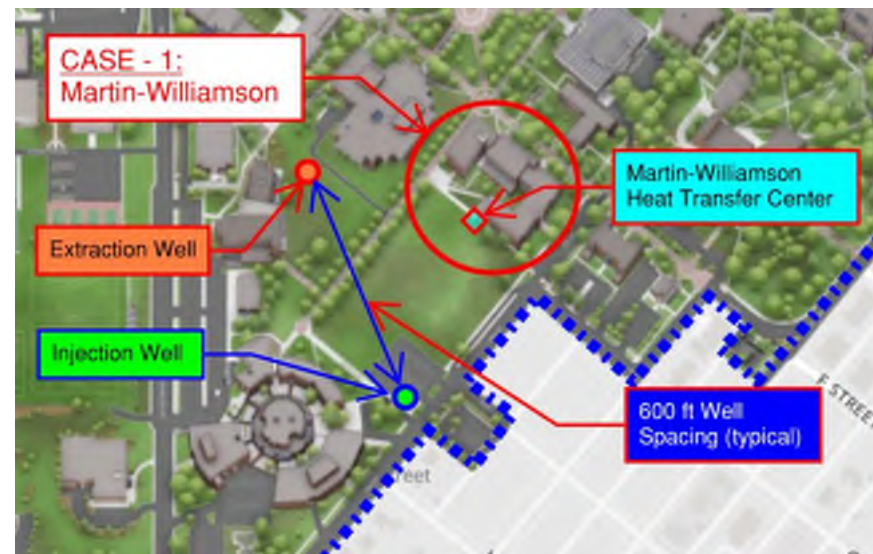

The proposed location of the extraction well, for the Martin-Williamson Complex, would be near the NE corner of the CEB building. The location of the injection well would be at the SE corner of the vacant lot, where the former Reid Elementary School was torn down. This well would be situated near the corner of the lot, to allow for future construction in the main vacant area, with piping running along the edges, to and from the well heads.

## PROPOSED SYSTEM DESIGN:

The existing Martin-Williamson Complex is in the process of being studied for a complete renovation and upgrade.

This provides an excellent opportunity to consider possible new, energy efficient, carbon-zero, HVAC system options.

For this study, the proposed HVAC system would be based on a ground-source heat pump (GSHP) system, utilizing open-loop wells for supply and reinjection of ground water, which acts as the source of the heat-sink & source for the central heat pump equipment. Utilizing a ground-source heat pump system for the building heating needs, which utilizes electricity, instead of fossil-fuel based steam from the Rozell Central Plant, allows the facility to be heated up to 400% more efficiently compared the existing steam system, thereby providing for significant reductions in greenhouse gas (GHG) emissions.

## ENERGY & CARBON ANALYSIS:

## PERFORMANCE ANALYSIS:

The open-loop ground source heat pump system is able to reduce heating energy by about 60% compared to heating from the existing central steam plant. Cooling energy is similar to the central chiller plant, since the GSHP's higher efficiency is tempered somewhat by the extraction well pumping energy needs.

## SAVINGS FROM BASELINE:

Heating EUI Savings: **25 btu/sf/yr**  
 Energy Cost Savings: **\$11,000/yr**  
 Carbon Emissions Reductions: **135 tons/yr**  
 (27 gas cars off the road)

## FIRST COST ANALYSIS:

The proposed GSHP system using open-loop wells, will have significantly higher first costs compared to a system that ties into the existing central plant steam and hot water systems.

# CASE STUDY-2 | Four (4) Building – Micro-District GSHP System

## GROUND-SOURCE HEAT PUMP (GSHP) SYSTEM HVAC INFRASTRUCTURE:

- Water-to-Water Heat Recovery Chillers (Heat Pumps) – 2 Units/Bldg
- Heat Exchangers
- Distribution Pumps (To GSHPs)
- Extraction Well Supply Pumps
- Underground Piping to and from Well Heads.

## FIRST COSTS:

- Bldg HVAC Systems: 515K SF x \$35/sf = **\$18.0M** (Costs for GSHP system components only). Also requires existing HVAC systems to be retrofit for GSHP duty.

## OPEN-LOOP TYPE EXTRACTION & REINJECTION WELL CHARACTERISTICS:

Target System Capacity: **1,600 tons**

Ground Water Exchange Flow Rate: **4,800 gpm**

Spacing Between Extraction and Reinjection Wells: **600 ft**

Total Well Depth: **1,075 ft**  
No. of Wells: **6 (3-pairs)**

Pump Depth: **650 ft**  
Average Reinjection Backpressure: **20 PSI**

## FIRST COSTS:

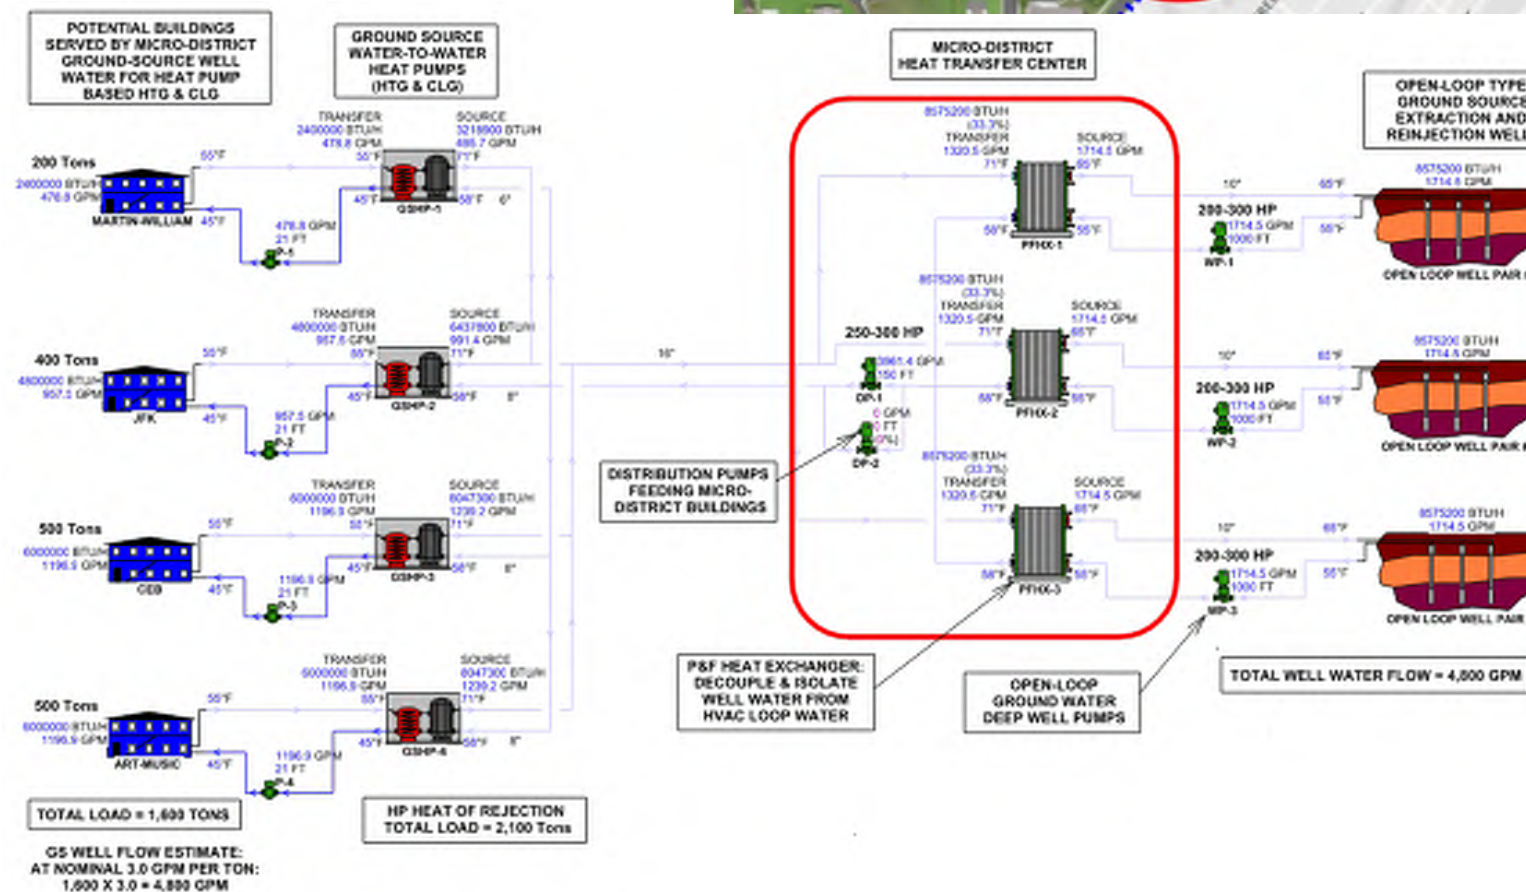

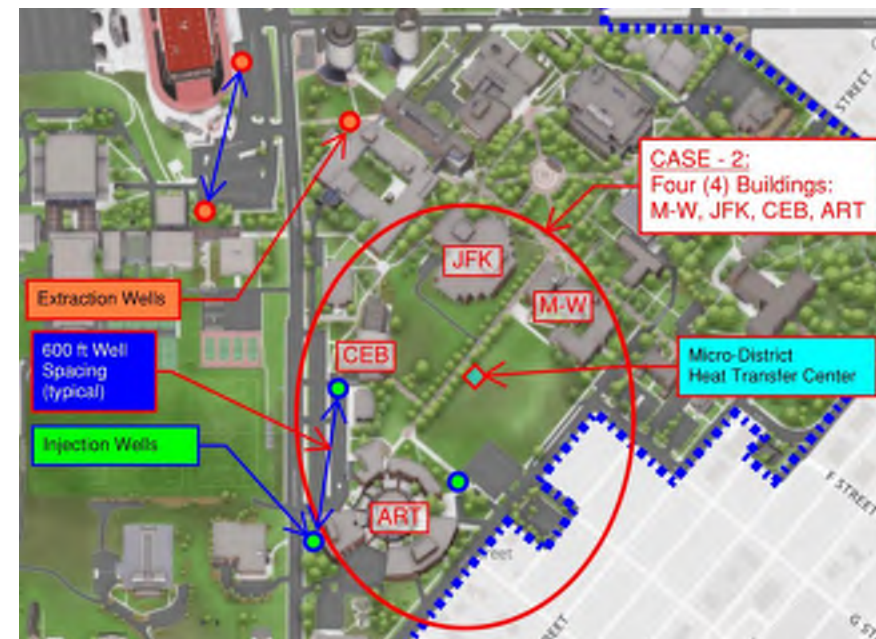

- Wells, Pumps & Piping: **\$10.5M** (\$1.5M per well – Typical)

## PROPOSED OPEN-LOOP WELL LOCATIONS:

Expanding on the well locations as proposed in Case Study-1, additional extraction wells would be added up-gradient, around the stadium parking areas, with matching reinjection wells located along Washington St, near the CEB and ART complexes.

## PROPOSED SYSTEM DESIGN:

In this scenario, the ground-source extraction wells would supply water to a central “Micro-District” Heat Transfer Center. Here the ground loops would be decoupled using heat exchangers, and secondary pumps would then distribute water to the various connected buildings in the network.

## ENERGY & CARBON ANALYSIS:

## ENERGY CONSUMPTION (MMBTU/YR)

## CARBON EMISSIONS (TONS/YR)

## PERFORMANCE ANALYSIS:

Similar to Case Study-1, The open-loop ground source heat pump system is able to reduce heating energy by about 60%, compared to heating from the existing central steam plant. There is some economy of scale in this scenario, with multiple wells that can be staged and optimized with load changes.

## SAVINGS FROM BASELINE:

- Heating EUI Savings: **30 btu/sf/yr**
- Energy Cost Savings: **\$65,000/yr**
- Carbon Emissions Reductions: **800 tons/yr** (160 gas cars off the road)

## FIRST COST ANALYSIS:

The proposed GSHP system using open-loop wells, will have significantly higher first costs compared to a system that ties into the existing central plant steam and hot water systems.

# CASE STUDY-3 | Entire Campus Conversion to GSHP Systems

## GROUND-SOURCE HEAT PUMP (GSHP) SYSTEM HVAC INFRASTRUCTURE:

- Micro-District Heat Transfer Buildings
- Water-to-Water Heat Recovery Chillers (Heat Pumps) – 2 Units/Bldg
- Heat Exchangers
- Distribution Pumps (To GSHPs)
- Extraction Well Supply Pumps
- Underground Piping to and from Well Heads.

## FIRST COSTS:

- Bldg HVAC Systems:  
2,600,000 SF x \$30/sf = \$78.0M  
(Costs for GSHP system components only). Also requires existing HVAC systems to be retrofit for GSHP duty.

## OPEN-LOOP TYPE EXTRACTION & REINJECTION WELL CHARACTERISTICS:

Target System Capacity:

**4,800 tons to 6,000 tons**

Ground Water Exchange Flow Rate:

**12,000 gpm to 15,000 gpm**

Spacing Between Extraction and Reinjection Wells:

**600 ft**

Total Well Depth:  
**1,075 ft**

No. of Wells:  
**20 (10 pairs)**

Pump Depth:  
**650 ft**

Average Reinjection Backpressure:  
**20 PSI**

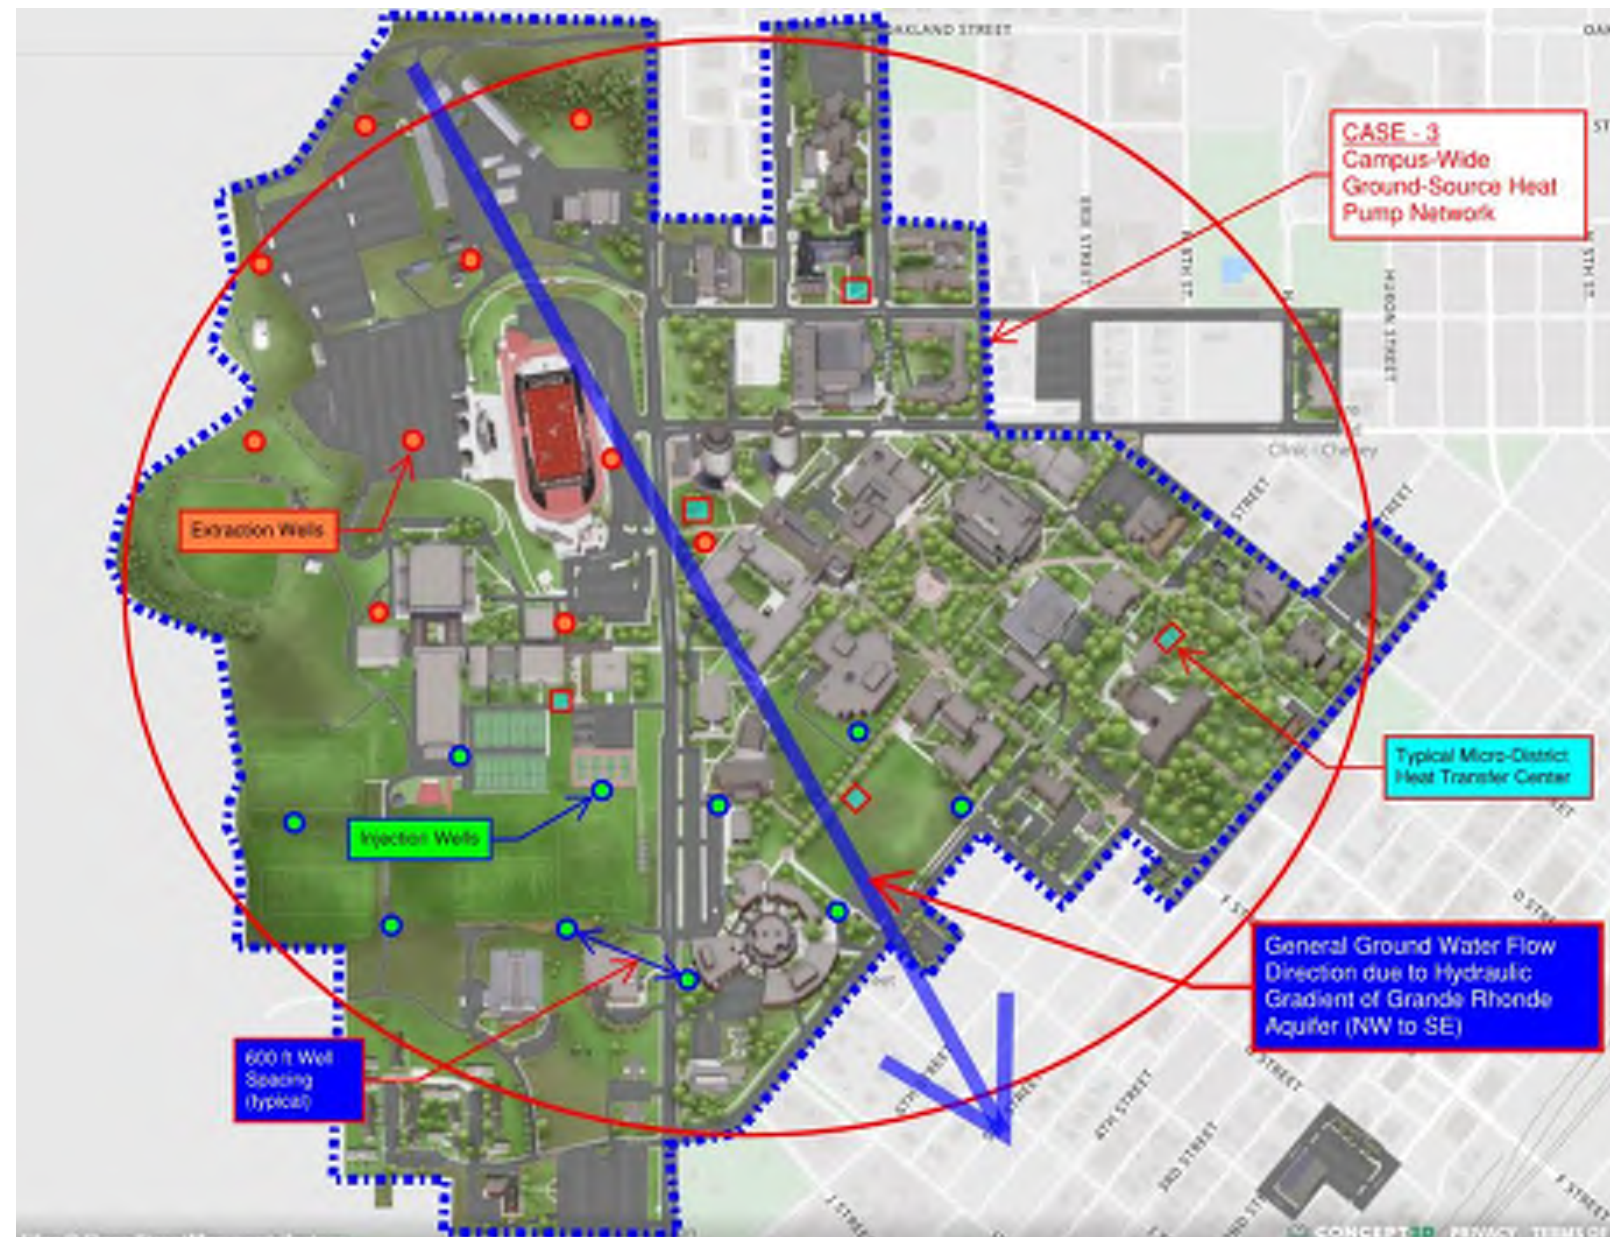

## FIRST COSTS:

- Wells, Pumps & Piping: \$32.0M  
(\$1.5M per well – Typical)

## PROPOSED OPEN-LOOP WELL LOCATIONS:

Converting the entire campus heating system to ground source heat pumps will require a considerable expansion of the well fields proposed in Case Studies 1 & 2. Under this scenario, it is envisioned that the extraction wells would be located up-gradient, mostly around the stadium and parking lots. The injection wells would be situated SE from the extraction wells, primarily along the perimeter of the playfields and central campus lawn areas.

Under this scenario, all of the campus buildings steam heating systems would need to be retrofit, in order to utilize the lower heating water temperatures produced by the ground-source heat pump systems. This will require a multi-year, phased approach, in order to transition away from the central energy plant, to the proposed distributed energy system.

## ENERGY & CARBON ANALYSIS:

## ENERGY CONSUMPTION (MMBTU/YR)

## CARBON EMISSIONS (TONS/YR)

## PERFORMANCE ANALYSIS:

Performance estimates for this scenario are simply extrapolations of the other case studies, scaled to the entire campus area. Due to the variations in building types, uses, operation, age, etc., detailed energy modeling estimates at this stage are not practical.

## SAVINGS FROM BASELINE:

- Heating EUI Savings: **48 btu/sf/yr**
- Energy Cost Savings: **\$620,000/yr**
- Carbon Emissions Reductions: **7,700 Tons/yr**  
 (1,540 gas cars off the road)

## FIRST COST ANALYSIS:

The costs of the proposed campus-wide GSHP system, to convert from central plant steam and chilled water, will be significant. Numbers presented here are simply rough-order-of-magnitude values, for conceptual planning purposes.

Martin Williamson Hall - Project Site

# SECTION 1

## EXECUTIVE SUMMARY

## 1.0 EXECUTIVE SUMMARY

### 1.1 PROBLEM SUMMARY

Martin Williamson Hall stands as one of Eastern Washington University's largest academic buildings, encompassing approximately 90,000 gross square feet. Positioned prominently near the main campus quad, Martin Williamson creates an iconic historic backdrop for the pedestrian heart of campus life.

Martin Williamson Hall houses two of five programs within the College of Professional Programs: the School of Education and the School of Psychology. Also located within Martin Williamson Hall, and closely tied to the departments and academic success is Counseling and Wellness Services.

The current condition and configuration of Martin Williamson Hall presents significant obstacles and limitations to the departments housed within, inhibiting effective quality program instruction, administration, and student services. Addressing these challenges is paramount to fostering an environment conducive to student and departmental success at EWU.

Eastern Washington University is working to reduce its Energy Use Intensity (EUI) to meet Clean Building Performance Standard requirements and aims to switch from fossil fuel-based heating to alternative energy sources.

### 1.2 OPPORTUNITY AND PROGRAM REQUIREMENTS

Currently, Martin Williamson Hall houses the School of Education, School of Psychology, and Mental Health Counseling Services, but the building lacks sufficient space and amenities to support these programs effectively. There are issues with accessibility, safety, and outdated infrastructure, which impact the learning environment and research capabilities. Additionally, these shortcomings contribute to high energy usage and carbon emissions.

The proposed project is envisioned as a 124,000 gsf multi-story and multi-use facility to house the School of Education, School of Psychology, Counseling and Wellness Services, and Student Accommodations and Support Services.

*Martin Hall Entry*

*Martin Williamson Hall Connection & Williamson Entry*

*Martin Williamson Hall Connection*

EWU currently houses the critical student support services of Mental Health Counseling Services, Wellness Services, and Student Accommodations and Support Services spread across three different buildings on campus. Consolidating the three services of Mental Health Counseling, Wellness, and Student Accommodations into a single building at the campus core will improve access and offer streamlined and holistic wrap-around support to EWU students.

Mental Health Counseling services are presently housed in Martin Hall, where the counseling offices and treatment rooms are outdated and inadequate. These spaces lack sufficient size and amenities to accommodate the full range of services provided. Moreover, they suffer from accessibility shortcomings and fail to uphold the necessary standards for patient confidentiality.

Wellness Services currently reside within the University Recreation Center and lacks a dedicated space for its Peer Health Educators and Eagles for Recovery program. With Counseling and Wellness housed in separate buildings, it not only hinders collaboration and wrap-around student support, but challenges the Director to provide timely oversight and immediate assistance to both initiatives.

Student Accommodations and Support Services currently occupies two segmented areas in the basement level of Hargreaves Hall. This space poses challenges for individuals with mobility or vision impairments due to its remote location within the building requiring the use of ramps and elevators. Furthermore, the case manager offices located in a separate suite creates obstacles for directors to efficiently oversee activities and provide assistance when required.

The COVID-19 pandemic produced psychological hardship across the world and has created new social and academic challenges for today's youth. The World Health Organization says, "COVID-19 pandemic triggers 25% increase in prevalence of anxiety and depression worldwide in its first year;" "By the end of 2021 the situation had somewhat improved but today too many people remain unable to get the care and support they need for both pre-existing and newly developed mental health conditions."

**This project will allow Eastern Washington University's Counseling and Wellness Services, Training Clinic, and Student Accommodations and Support Services to be conveniently collocated at the center of campus, where they will be able to provide high quality services to students, faculty, staff, and the broader community for free and in private spaces designed for confidentiality and comfort.**

This project will result in a new functional facility that addresses modern instruction and research needs and provides a sensitive and supportive environment for all EWU students. The facility will have an expected life of 50-100 years, and will significantly increase energy efficiency, with a high-performance envelope, and all new low carbon energy efficient designs and equipment. It will be designed to a minimum LEED Silver certification by the U.S. Green Building Council and to meet the Washington State Clean Building Standards.

An energy life cycle cost analysis was conducted to explore potential energy systems for the building. This assessment revealed an energy use reduction from the existing building, which could lower the overall campus EUI by over 6%, bringing it within the Clean Building Performance Standard requirements. With these high-performing energy systems and a connection to the newly proposed all-electric geothermal heating system, this building will become one of the first all-electric buildings on campus, significantly reducing the campus' operational carbon emissions.

### 1.3 SUMMARY OF ALTERNATIVES

The Martin Williamson Hall Predesign considered three alternatives summarized below.

#### **Alternative A: No Action**

A no action alternative was considered.

#### **Alternative B: Renovation & Replacement**

Alternative B explored the full renovation of Martin Hall and the complete replacement of Williamson Hall.

#### **Alternative C: Historic Screen (Preferred Alternative)**

Alternative C presents a comprehensive plan centered on the replacement of Martin Williamson Hall while preserving two of Martin Hall's historic facades—the northeast and southeast elevations.

### 1.4 SUMMARY OF PREFERRED ALTERNATIVE

The identified institutional goals, program needs, and ability to address state mandated performance criteria can be best addressed through Alternative C: Historic Screen. This approach aligns most closely with EWU's institutional mission and overarching goals, while effectively addressing the project's Guiding Principles, and meeting the diverse needs of academic and student service programs to be housed in the facility.

*Alternative A Axon - No Action*

*Alternative B Axon - Renovation & Replacement*

*Alternative C Axon - Historic Screen*

1.5 SUMMARY BUDGET OF PREFERRED ALTERNATIVE

| Summary Budget of Preferred Alternative |                            |                            |                      |                              |                              |                           |
|---|----------------------------|----------------------------|----------------------|------------------------------|------------------------------|---------------------------|
|   | Phase 1 -<br>Cost Estimate | Phase 2 -<br>Cost Estimate | Total Cost           | Phase 1 -<br>Escalated Costs | Phase 2 -<br>Escalated Costs | Total Cost -<br>Escalated |
| Acquisition                             | \$0                        | \$0                        | \$0                  | \$0                          | \$0                          | \$0                       |
| Consultants                             | \$8,056,326                | \$5,466,907                | \$13,523,233         | \$8,789,190                  | \$6,117,967                  | \$14,907,157              |
| Construction                            | \$64,423,332               | \$44,402,726               | \$108,826,058        | \$73,112,861                 | \$53,879,081                 | \$126,991,942             |
| Equipment                               | \$3,308,181                | \$2,448,205                | \$5,756,386          | \$3,762,394                  | \$2,973,101                  | \$6,735,495               |
| Artwork                                 | \$441,683                  | \$325,913                  | \$767,596            | \$441,685                    | \$325,913                    | \$767,598                 |
| Project Admin                           | \$2,349,834                | \$1,821,884                | \$4,171,718          | \$2,672,466                  | \$2,212,496                  | \$4,884,962               |
| Other Costs                             | \$0                        | \$0                        | \$0                  | \$0                          | \$0                          | \$0                       |
| <b>Total Project</b>                    | <b>\$78,579,356</b>        | <b>\$54,465,635</b>        | <b>\$133,044,991</b> | <b>\$88,778,596</b>          | <b>\$65,508,558</b>          | <b>\$154,287,154</b>      |

# SECTION 2

## PROBLEM STATEMENT

## 2.0 PROBLEM STATEMENT

### 2.1 IDENTIFY THE PROBLEM & OPPORTUNITIES

#### Problem

EWU seeks design funding to renovate and re-imagine Martin Williamson Hall. Constructed in 1935 and later renovated in 1977, Martin Hall's evolution reflects the changing landscape of academic pedagogy. While the renovation in '77 introduced specialized laboratory and research clinical spaces, aligned with teaching methodologies of the time, these configurations now pose barriers to modern instructional practices. In contrast, Williamson Hall, erected in 1967, awaits comprehensive renovation and crucial infrastructure upgrades, with its systems exceeding their anticipated lifespans.

The current condition and configuration of Martin Williamson Hall presents significant obstacles and limitations to the departments housed within, inhibiting effective quality program instruction, administration, and student services. Addressing these challenges is paramount to fostering an environment conducive to student and departmental success at EWU.

#### Opportunities

This project offers opportunities to tackle current programmatic, safety, equity, sustainability, and operational challenges facing Martin Williamson Hall. Through strategic initiatives, EWU aims to profoundly enhance the experiences of students, faculty, and staff within the School of Education, School of Psychology, Counseling and Wellness Services, Student Accommodations and Support Services, and the wider EWU community. The renovation of Martin Williamson Hall encompasses several key opportunities:

- **Quality Learning Outcomes:**

Transforming underutilized and inadequate instructional spaces into new, accessible, and supportive learning environments tailored to meet the diverse needs of the student body. This alternative proposes a reduction in classrooms from 27 to 15, which improves EWU's total campus classroom utilization.

- **High-Performance and Decarbonization:**

Implementing state-of-the-art, energy-efficient building systems to minimize energy consumption and reduce the need for ongoing maintenance. These upgrades not only benefit the environment but also ensure the long-term functionality of the facility.

Eastern Washington University is actively seeking strategies to reduce its campus Energy Use Intensity (EUI) to meet the Clean Building Performance Standard requirements, as the current EUI exceeds these standards. Additionally, the university aims to utilize alternative heating sources that do not rely on fossil fuels, compared to their existing fossil fuel-driven campus steam plant.

- **Inclusive and Equitable Environments:**

By housing C&WS and SASS within the building, implementing universal design principles will enhance the capacity of these programs to support all EWU students effectively and equitably. The inclusion of Inclusive Restrooms, designed to accommodate students of all identities, abilities, and backgrounds, will set a precedent for future models across the EWU campus.

- **Safety and Access:**

Enhancing accessibility and safety measures by ensuring all building entries are accessible, eliminating long dead-end corridors to improve emergency response, addressing accessibility deficiencies, and enhancing wayfinding and navigational features.

Auditorium

## 2.2 DRIVERS FOR THE PROJECT'S OPERATIONAL PROGRAMS

The existing Martin Williamson Hall is currently in non-compliance or below standard requirements of the following local, state, and federal codes:

### Accessibility Requirements for People with Disabilities:

- Washington State Law Against Discrimination (RCW49.60.222)
- Washington State Building Code (WAC 52-50)
- Americans with Disabilities Act of 1990 (2 U.S.C. Part B)
- Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794)

### Green Building Requirements:

- High Performance Building – LEED Silver Standard (RCW 39.35D)
- State Energy Standards for Clean Buildings, RCW 19.27A.210
- Per Executive Order 20-01 State Efficiency and Environmental Performance, New Facility Construction, dated January 23, 2020.
- Electric Car Charging Stations per RCW 19.27.540
- Greenhouse Gas Reduction Strategies per RCW 70A.45.070

### Infrastructure Requirements:

- International Building Code (IBC)
- International Mechanical Code
- International Fire Code (IFC)
- Local Codes & Ordinances
- National Electric Code (NFPA 70)

### Fire Protection Requirements:

- National Fire Protection Association (NFPA) Section 13
- International Fire Code (IFC)
- Regulations of the State Fire Marshall

Pedagogy, research, and technology requirements significantly differ from those of fifty years ago when the buildings were constructed and renovated. Current techniques often include more project-based work which demands group participation in a large room setup with multiple teaching and learning aids. These typically square spaces don't fit well in the old building with short spans and small column bays. The few larger classrooms in the existing building have limited technology infrastructure and difficult site lines for students sitting at the room's periphery.

Existing Mental Health Counseling Services Entrance

Existing Student Space

2.3 CONNECTION TO AGENCY MISSION, GOALS AND OBJECTIVES

The Guiding Principles and preferred alternative for this project align with Eastern Washington University’s institutional goals at several levels and across several of their different campus plans and initiatives.

Guiding Principles

The proposed renovation of Martin Williamson Hall supports Eastern Washington University’s commitment to expanding opportunities for personal transformation through excellence in learning through three core themes of access, learning, and completion. The Martin Williamson Hall renovation embodies each of these requirements by centering key wellness functions and departments that are feeders to our regional wellness and education systems into a single multidisciplinary and highly functional building.

An initial visioning workshop was held with the Pre-design Committee to develop a list of goals and aspirations that would guide the project. The identified goals were all centered around three themes: CONNECTIVE, SUPPORTIVE, and FUTURE FORWARD. The below Guiding Principles will be referenced throughout the design process and aid in project decision making.

CONNECTIVE

- Articulate spaces that are **WELCOMING** to all and foster **CONNECTION**.
- Encourage a **COLLABORATIVE ENVIRONMENT** for student, faculty, and departmental interactions.

SUPPORTIVE

- Create environments that are **SENSITIVE** and meet needs beyond that which is basic and required.
- Provide students and faculty with a modern space for **RESEARCH** and **APPLIED WORK** so they hone skills to **SERVE** their communities.

FUTURE FORWARD

- Build for **LONGEVITY** of infrastructure and program **ADAPTABILITY**, always considering the building’s **NEXT LIFE**.
- Reduce environmental impact through **DECARBONIZATION** and improved **EFFICIENCY**.

**Alignment to EWU Institutional Strategic Plan**

The mission of Eastern Washington University is to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence. The renovation of Martin Williamson Hall will support EWU’s 2024-2029 Institutional Strategic Plan (in the process of being finalized and adopted by the board of trustees) through:

**ACCESSIBILITY:**

Martin Williamson Hall will convert an outdated building, no longer compliant with current codes for accessibility and safety, by improving access and inclusivity throughout to reflect the vibrant, welcoming, and supportive environment they strive to create.

**ACADEMIC EXCELLENCE:**

Martin Williamson Hall will transform the learning experience of EWU students creating a learning environment that is a hub of hands-on learning, collaboration, and support.

**BELONGING:**

Martin Williamson Hall will elevate and improve access for all EWU students to Counseling and Wellness Services and Student Accommodations and Support Services by collocating these critical support programs in a central and convenient location.

**REGIONAL IMPACT:**

Martin Williamson Hall will promote collaboration across the Education and Psychology departments and be a conduit for interaction between faculty, students, and administrators leading to new and unrealized opportunities to support the region.

**STUDENT SUCCESS:**

Martin Williamson Hall will be transformed into a student-centered hub for learning and support services. Modern functional learning environments will inspire students and ensure that success is not only measured or achieved through academics but a wholistic student experience.

**SUSTAINABILITY:**

Martin Williamson Hall will have high-performing energy systems and a connection to the newly proposed all-electric geothermal heating system and will become one of the first all-electric buildings on campus.

*Primary Campus Pathway - Martin Hall*

*Arevalo Student Mall Near Martin Williamson*

*Secondary Campus Pathway - Williamson Hall*

**Alignment with EWU Campus Master Plan**

Eastern Washington University plans to revisit the Campus Master Plan starting summer of 2024 and the renovation of Martin Williamson Hall will remain a critical component of their future planning.

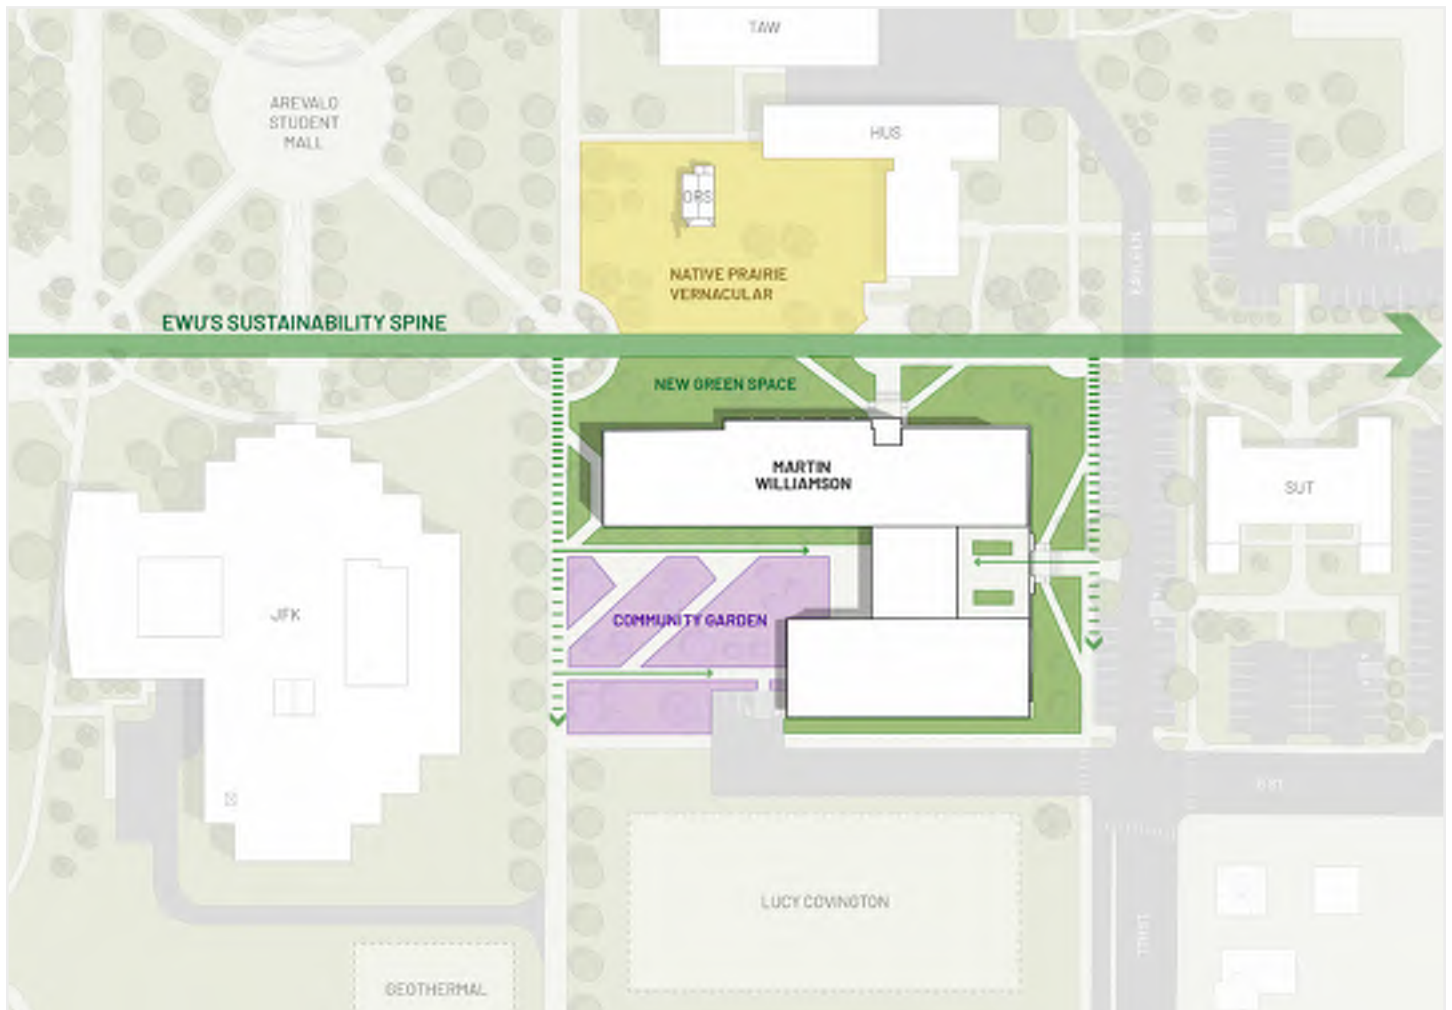

**Alignment with EWU Climate Action Plan**

The major renovation of Martin Williamson Hall is one of the top building priorities identified in EWU’s 2022-2025 Climate Action Plan to support targeted reductions in campus energy use and greenhouse gas emissions.

By connecting this building to the newly proposed, ultra-high efficient geothermal heating and cooling system, it will become one of the first on campus to enable energy trading with existing buildings. This setup will allow the capture and utilization of previously wasted energy.

**Alignment with EWU Climate Resiliency Landscape Master Plan**

EWU’s Climate Resiliency Landscape Master Plan establishes a ‘Sustainability Spine’ that seamlessly integrates sustainable landscaping into the heart of the campus. This initiative aims to showcase EWU’s commitment to sustainability and climate resilience, providing students with daily exposure to these essential concepts. The ‘Sustainability Spine’ will span the entirety of Martin Williamson Hall’s northeast facade, with extensions reaching along its northwest and southeast facades. The preferred Alternative C: Historic Screen intends to incorporate elements of the ‘Sustainability Spine’ into its landscape design.

*Alignment with EWU Climate Resiliency Landscape Master Plan*

2.4 SUMMARY OF NEEDS TO SOLVE THE PROBLEM

There are three key components necessary to solve this problem.

1. To best support EWU students with mental health, wellness, and accommodation services, the critical student affairs services such as Counseling and Wellness Services and Student Accommodations and Support Services should be consolidated and collocated at the campus core.
2. To provide quality learning outcomes and grow the region’s pool of educators and mental health professionals the School of Education and School of Psychology need modern pedagogically appropriate instructional labs, research space, and classrooms to support learning and innovation.
3. To support EWU’s decarbonization plan, reduce operational costs, and meet the campus EUI requirements of the Clean Building Performance Standard, this project necessitates the connection to a new all-electric heating system. This newly proposed all-electric ground source heating and cooling system, known as the Geo Eco Plant, will serve as a standalone heating and cooling central utility plant. The Geo Eco Plant will provide energy to multiple buildings on campus, including this project, enabling energy trading between connected buildings and utilizing previously wasted energy. The Geo Eco Plant will also serve as an instructional tool for the campus and local community, showcasing forward-thinking methods for providing heating and cooling to the campus using renewable energy sources.

2.5 PROJECT HISTORY

Martin Hall was constructed in 1935 to house the campus elementary training school. Williamson Hall was constructed in 1967 to house the growing School of Education. Martin Hall underwent an intensive interior renovation in 1980 to create specialized lab spaces for the School of Psychology. Williamson Hall has never been fully renovated.

# SECTION 3

PROGRAM ANALYSIS

## 3.0 ANALYSIS OF ALTERNATIVES

### 3.1 ALTERNATIVES CONSIDERED:

The following offers additional descriptions of the three alternatives considered for this project

#### 3.1.1 ALTERNATIVE A: NO ACTION

A No Action alternative was considered but would involve a number of limitations and negative outcomes for EWU students, faculty, and the broader regional community.

#### Advantages:

- There are no advantages to a No Action alternative.

#### Disadvantages:

- Inability to offer quality instruction and learning outcomes for Departments of Education and Psychology.
- Limits ability to grow the Education and Psychology programs and in turn the regional pool of educators and trained mental health professionals.
- Further degradation of a historic structure at the heart of EWU's campus.
- High maintenance and operational costs due to outdated and low performing infrastructure.
- The existing inefficient layout with a 54% efficiency factor remains and contributes to wayfinding and safety issues with many internal halls and corridors.

Existing Martin-Williamson

#### KEY

- Demolished Space
- New Space
- Existing Space

### 3.1.2 ALTERNATIVE B: RENOVATION & REPLACEMENT

The Renovation and Replacement alternative suggests a substantial renovation of Martin Hall, including 58,700 sf, along with the replacement of Williamson Hall with a 74,300 sf addition, resulting in a total area of 133,300 sf. The current limitations of the building's size and structural systems make it impossible to accommodate adequately sized and accessible classrooms, necessitating a significant expansion. The existing building's layout and condition are obsolete and require full replacement. Additionally, existing conditions do not support modern teaching methods, inclusivity, or student well-being. Given these considerations, a comprehensive renovation of the existing building and the addition is necessary.

#### Advantages:

- Retains the historic character of Martin Hall.
- Retains a portion of the embodied carbon of Martin Hall's concrete structure.
- Can redefine the sense of welcome and building character that faces the campus mall.

#### Disadvantages:

- Requires the demolition and replacement of Williamson Hall.
- Results in minimal long-term adaptability in renovated Martin Hall due to size and spacing of structural system.
- Requires about 9,000 gross square feet more to accommodate the baseline assignable program spaces due to structural grid inefficiencies.
- Larger classroom spaces would be in the new addition retaining limitations to the configuration of spaces in Martin Hall.
- Student support services, such as Counseling and Wellness Services and Student Accommodations and Support Services, remaining in Martin Hall will be either segmented or spread inefficiently along narrow portions of the building due to structural limitations.
- Maintains a mostly enclosed building courtyard with limited visibility and access by the greater EWU campus.
- Segmented and choppy program organization.
- Results in reduced operational efficiency at the renovated portion of the building due to limited envelope improvements, low floor-to-floor height, and inefficient program layout.

#### Demolished Area Shown in Green

#### New Space Shown in Blue

#### KEY

- Demolished Space
- New Space
- Existing Space

### 3.1.3 ALTERNATIVE C: HISTORIC SCREEN (PREFERRED ALTERNATIVE)

The Historic Screen alternative suggests preserving two of Martin Hall's historic facades and replacing much of the structure with an adaptable and efficient 124,000 sf building beyond.

#### Advantages:

- Retains the historic character of Martin Hall's signature facades.
- Redefine the sense of welcoming and character that faces the campus mall.
- Implements a new structural system that supports long-term adaptability of the building.
- Results in a more cohesive program organization to improve access, wayfinding, and circulation.
- Student support services, such as Counseling and Wellness Services and Student Accommodations and Support Services, can be collocated in an area of the building that supports student access and functionality within the suite.
- Defines outdoor spaces that improve access and use, engage the surrounding campus, and reduce safety and security concerns.
- Results in better operational performance due to a primarily new envelope and more efficient plan and program organization.

#### Disadvantages:

- Requires the demolition of the majority of Martin Williamson Hall.
- Lost embodied carbon in the demolition of the existing structural systems and building envelope.
- Requires temporary support to preserve the historic facades during construction and demolition.

#### Demolished Area Shown in Green

#### New Space Shown in Blue

#### KEY

- Demolished Space
- New Space
- Existing Space

3.1.4 PREFERRED ALTERNATIVE & WHY

Alternative C: Historic Screen has been designated as the preferred option by the Pre-design Committee. This approach aligns most closely with EWU’s institutional strategic goals, while effectively addressing the project Guiding Principles and meeting the diverse needs of the academic and student service programs.

The matrix provided below served as a valuable tool for the Pre-design Committee, facilitating interactive discussions and comparative analysis of the alternatives against the established Guiding Principles and other pertinent factors. Notably, Alternative C: Historic Screen emerged as the standout choice across most categories, affirming its status as the preferred alternative for the project.

3.2 COST ESTIMATE FOR EACH ALTERNATIVE

3.2.1 ESTIMATE OVERVIEW

Cost Estimates were performed for each of the two new construction options. All of the options used the same general assumptions including the delivery type, construction materials, and building systems. The estimates also used the same program areas and assignable square footages. The differences in cost reflect the variations in overall building efficiency and the different amounts of building envelope required by each layout option.

|                                 | Ownership Option 1 | Ownership Option 2 | Preferred Option<br>Ownership Option 3 |
|---------------------------------|--------------------|--------------------|--|
|                                 | No action          | Reno & Replace     | Historic Screen                        |
| ASF                             | 49,275             | 87,062             | 87,062                                 |
| GSF                             | 91,500             | 133,000            | 124,375                                |
| Efficiency                      | 54%                | 65%                | 70%                                    |
| Construction MACC               | 0                  | 83,938,751         | 90,603,907                             |
| <b>Unescalated Project Cost</b> | <b>0</b>           | <b>122,605,913</b> | <b>133,044,991</b>                     |

3.2.2 LCCM

Each of the construction alternatives were analyzed using the Office of Financial Management (OFM) Life Cycle Cost Model (LCCM). The No Action alternative was not studied as it will not meet the university’s needs as outlined above. As part of the analysis, energy modeling was performed to understand the energy efficiency of each layout along with the programmatic efficiency.

|                                | Ownership Option 1 | Ownership Option 2 | Preferred Option<br>Ownership Option 3 |
|--------------------------------|--------------------|--------------------|--|

3.3 SCHEDULE ESTIMATE

Alternates B and C would have the same anticipated project schedule as outlined below. A full milestone schedule is included in Section 4.

| Project Phase                     | Date of Completion |
|-----------------------------------|--------------------|
| Pre-design                        | June-24            |
| Schematic Design                  | April-26           |
| Design Development                | November-26        |
| Construction Documents            | June-27            |
| Phase 1 - Bid/ Award/ Contracting | July-27            |
| Phase 1 - Construction Start      | August-27          |
| Phase 1 - Construction Mid Point  | June-28            |
| Phase 1 - Substantial Completion  | May-29             |
| Phase 1 - Final Completion        | June-29            |
| Phase 2 - Bid/ Award/ Contracting | July-29            |
| Phase 2 - Construction Start      | August-29          |
| Phase 2 - Construction Mid Point  | June-30            |
| Phase 2 - Substantial Completion  | May-31             |
| Phase 2 - Final Completion        | June-31            |

# SECTION 4

DETAILED ANALYSIS OF  
PREFERRED ALTERNATIVE

## 4.0 DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

### 4.1 DESCRIPTION OF PREFERRED ALTERNATIVE

The following offers a detailed analysis of the preferred alternative regarding nature of space, occupancy numbers, basic configuration, and space needs.

#### 4.1.1 NATURE OF SPACE

Martin Williamson Hall will support four distinct entities for EWU, including two academic departments and two student support services programs. The entities to be housed in the building are the School of Education, School of Psychology, Counseling and Wellness Services, and Student Accommodations and Support Services. To support these four separate entities, the building will require a diverse array of counseling, assessment, instructional, research, administrative, office, storage, and student space.

##### School of Education

The School of Education prepares student-centered educators to be professionals, leaders, scholars, and practitioners to support the rural communities of the region.

- Center for Rural Education Effectiveness - NEW: EWU is in the planning stage of becoming a rural education hub which includes devoted space for education and technology to reach remote districts. (Aligns with RCW 28B.10.033.1.b.i)
- Continuing Education Programs: To maintain certification, educators are required to complete continuing education credits throughout their career. EWU offers Professional and Continuing Education opportunities for either professional development or personal enrichment through clock hours, professional certifications, and continuing education units.
- Field Experience: Coordinates school-based field experiences and full-time student teaching internship placements for all teacher candidates in the EWU School of Education.

To attract teaching candidates in these high-need areas, EWU must fulfill the Professional Educators Standards Board Domain 7, which states that “Providers ensure that programs have adequate resources, facilities, and governance structures to enable effective administration and fiscal sustainability.” Specifically, 7.3 addresses three components of adequate facilities which include having necessary classrooms, lab and office spaces, and current technology.

##### School of Psychology

The School of Psychology offers programs that are critical and necessary for the region, serving to address shortages in mental health and school service provision, and providing important applied research. EWU’s graduate and undergraduate programs directly support and provide a pipeline to support these three regional areas of need. In addition to academic offerings, existing and emerging curricular initiatives include the following:

- Autism Drop-In Center: Resource for students identified with autism spectrum disorder.
- Training Clinic - NEW: Providing effective and affordable mental health services to the community and a site to train doctoral students in clinical psychology programs.
- Assessment Program: To support the evaluation, identification, and documentation needs of students with suspected learning disabilities, neurocognitive disorders, and ADHD.
- Sports Psychology Services

Currently Martin Williamson Hall is a barrier to effective education and learning for the School of Education and School of Psychology. Reconfigured spaces equipped with modern infrastructure systems and technology will make it possible for the programs to not only attract more students but offer improved learning outcomes and ultimately better educational outcomes to support regional needs in educators and mental health professionals.

## Counseling & Wellness Services

Counseling & Wellness Services provides EWU students with an array of initiatives that support their mental, emotional, and physical wellbeing. Below is a condensed list of some of the existing and emerging offerings:

- **Eagles for Recovery:** A collegiate program for EWU students who are in recovery, thinking about recovery, and those who want to participate as recovery allies. The program provides support and help navigating recovery while being a student at EWU.
- **“Let’s Talk” Events - NEW:** Counselors meet students where they are to offer no barrier consultations. Two that are a high priority for the counseling center include the Veteran’s Resource Center and CAMP (College Assistance Migrant Program) which serve students that underutilize counseling services.
- **H.E.A.R.T Workshops (Healing, Encouraging, and Rising Together) - NEW:** A workshop series tailored for students of color who are looking for a supportive, inclusive, and safe space to discuss daily stressors and lived experiences.
- **Food Pantry:** This year the Food Pantry has seen an 8% increase, serving 615 students each month.
- **TREE (Trauma Recovery Education at Eastern):** Provides planned university response for unexpected tragic events that gives structure, information, and a space to acknowledge what happened. Offering students, faculty, and staff a resource to turn to when they are feeling overwhelmed after an event.
- **Basic Needs Office Hours & Resource Center**
- **Mental Health First Aid Courses**
- **Sexual Health Education and Disease Prevention & Resources**

Over the course of the 2022-2023 regular academic year, the Counseling office had 2,134 attended appointments, which averages 711 appointments each quarter that does not include no-shows or canceled appointments. Thus far in 2024, counselors have helped 115 students assessed as being at academic risk, have held 113 outreach events, and have held appointments with 77 clients assessed as having some level of suicidal risk.

Example of C&WS Campus Outreach Events

**According to the American Foundation of Suicide Prevention suicide is the second leading cause of death for ages 10-24 in Washington state. According to federal guidelines 83% of communities in Washington did not have enough mental health providers to serve residents in 2023. These are staggering statistics that demonstrate how crucial it is to improve access to mental health services for students enrolled in postsecondary institutions.**

### Student Accommodations & Support Services

Student Accommodations & Support Services is a combination of the Student Care Team and Disability Support Services that serves students who may be struggling with personal challenges and/or obstacles.

- Student Emergency Fund (SEF): Provides limited, one-time, financial assistance to students unable to meet immediate, essential expenses because of temporary emergencies.
- Passport to Careers Program: Helps former foster youth and unaccompanied homeless youth succeed in college by connecting them to resources, peer mentoring, study space, peer counseling, assistance with FAFSA, communication with faculty, transitioning to the college environment, and support while living on campus.
- Assistive and Adaptive Technology
- Proctored Testing Accommodations
- Medical Accommodations
- Religious Accommodations

Over the last 5 years, SASS has averaged a 147% increase in cases per year. In the 2022-2023 academic year, Support Services managed 1205 cases requiring wrap-around care and proctored 250 exams. Accommodations staff averages serving 750 students per term. In the last year, the Passport to Careers Program has increased enrollment by 150%.

In the 2022-2023 academic year, Washington State legislature made significant investment in student success initiatives at EWU to help ensure that students achieve degree completion. Over the last several years EWU has implemented a total intake model for academic advising and developed a coordinated care network that is designed to:

1. Maximize collaboration of various student support services.
2. Create wraparound care that helps students navigate and overcome social, financial, and/or health obstacles that delay or prevent the successful completion of their degree.
3. Provide holistic care that helps meet the challenge of increasing mental health concerns on college campuses.

*Existing SASS Waiting Room*

*Existing SASS Testing Room*

*Existing SASS Meeting Space*

Currently student support services are spread across multiple buildings on campus and in locations with low visibility and lacking direct access. Collocating Counseling and Wellness Services and Student Accommodations and Support Services will improve collaboration of the various student support services and create a central and convenient location for students to get wrap-around support.

**4.1.2 OCCUPANCY NUMBERS**

Martin Williamson Hall will be the primary building for two of five programs in the College of Professional Programs: the School of Education and the School of Psychology. The building will supports all students, faculty, and staff in the School of Education and School of Psychology through use of its instructional labs, classrooms, student spaces, offices, administratives spaces, and more.

Martin Williamson Hall will also house two of EWU’s largest student services programs. Counseling and Wellness Services currently averages 711 appointments each quarter, a number that continues to increase each year. Student Accomodations and Support Services managed 1205 cases last year, proctored 250 exams, and assists an average of 750 students with accomodations each term - all numbers anticipacted to continue increasing.

**4.1.3 PROGRAM SPACE NEEDS**

The building gross square footage is 124,375 gross square feet with a net assignable area of 87,062 square feet. The following is a breakdown of the assignable building areas:

The program space list on the following pages contains a comprehensive breakdown of each space and its associated square footage. The quantities, areas, and supporting information therein were developed through a collaborative process including representatives from the departments and programs to be housed in the building and campus leadership in sustainability, planning, academics, and finance.

| Department                                   | Proposed SF    |

4.1.4 BUILDING CONFIGURATION

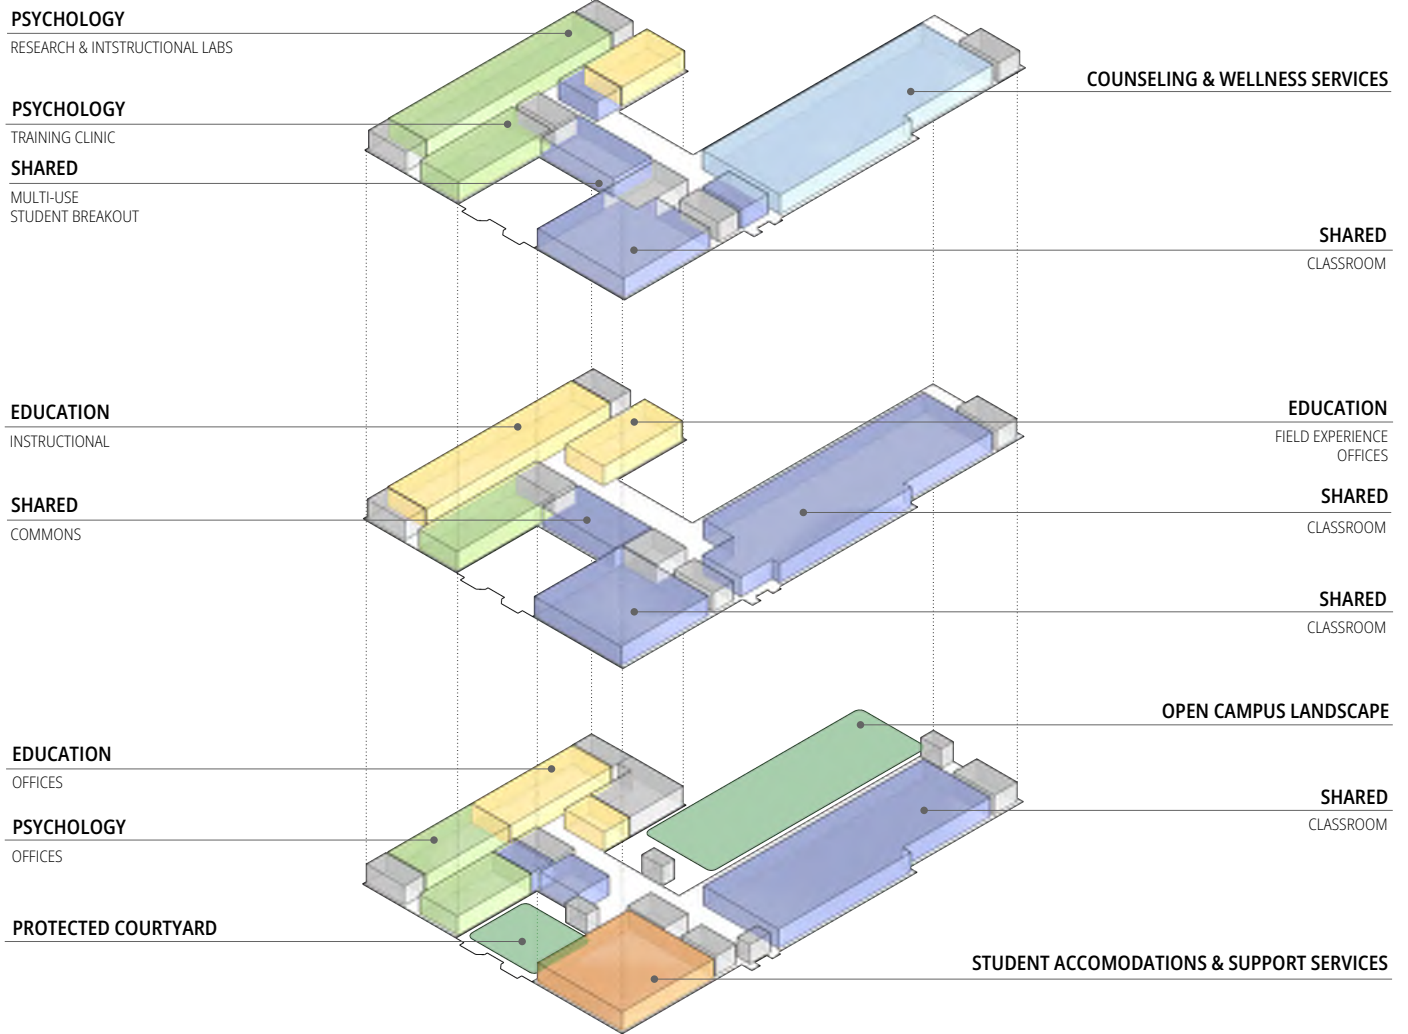

Martin Williamson Hall is conceived as a thoughtful and intensive renovation project, carefully integrating new elements while preserving the historic character of the northeast and southeast facades from its 1935 origins. Behind this historic screen, the project will introduce three new components: two bars and a central hub. These additions, designed as three-story structures using a combination of steel and mass timber, are strategically planned to meet the project’s functional requirements and aspirational goals while celebrating a piece of EWU’s campus architectural heritage.

The first bar, closest to the campus core, will contain student support services and shared instructional spaces. This layout will improve circulation within the building and reduce disruptions near department-specific instructional labs and offices. Student Accommodations and Support Services are conveniently located on the first level for easy access, encouraging student engagement, and to reduce stigma around accessing these resources by making them convenient and welcoming. Shared instructional spaces are spread across the first and second levels. Counseling and Wellness Services are placed on the third level to maintain a prominent central campus location while providing students with privacy when seeking support for sensitive matters.

The second bar to the south will contain department-specific instructional labs, offices, administrative areas, and the new training clinic. With lower foot traffic, it aims to minimize disruptions to hands-on learning in the labs and promote interaction between the Department of Education and Department of Psychology through collocation of office neighborhoods.

The two bars converge at a central hub of shared meeting and student-centered spaces, providing a venue for collaboration among departments, faculty, and students. This central area will include Student Breakout spaces, a versatile Commons for open student use and departmental events, and flexible meeting spaces. In addition to facilitating connections between people, this hub provides easy access to two outdoor areas that act as an extension of the communal space within: a protected courtyard and an open campus landscape.

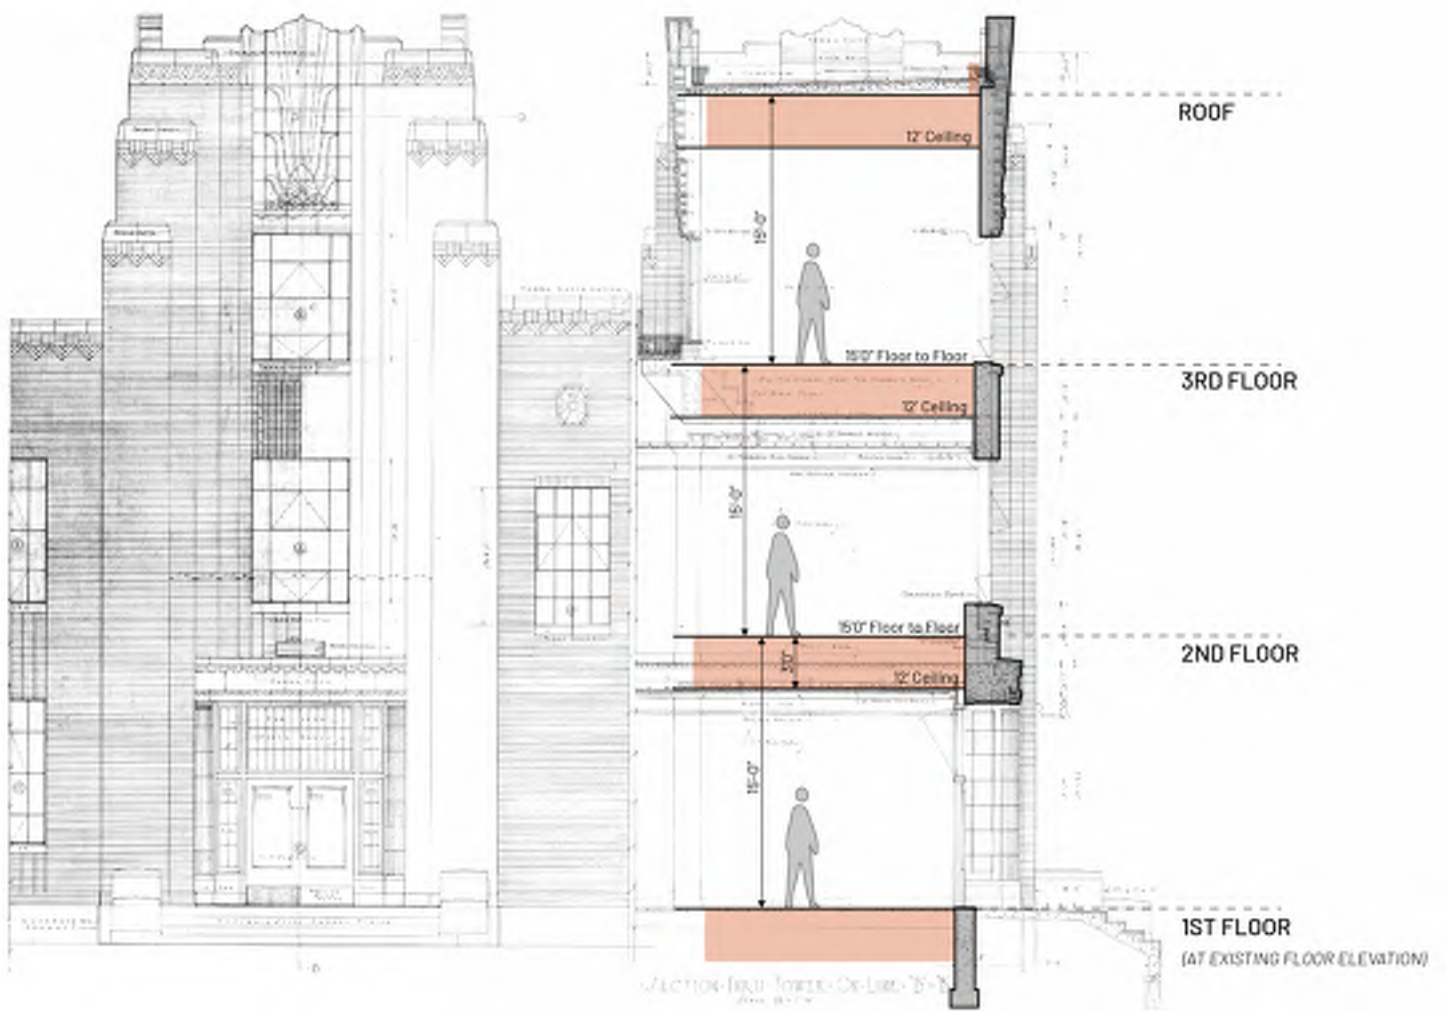

*Program Axonometric*

The original 1935 Martin Hall was built as a two-story structure with a low 13'-6" floor-to-floor height. The project will introduce new three-story components with a higher 15'-0" floor to floor height to accommodate modern building infrastructure.

These new three-story volumes will intersect the historic screen on the northeast and southeast facades. These intersections will be carefully crafted to ensure the historic character is preserved while maintaining the functionality within the building.

Section through Tower

4.2 SITE ANALYSIS

The following offers a detailed analysis of the project site.

4.2.1 LOCATION

The proposed site, and only location considered for the project, was the existing location of Martin Williamson Hall. Its present location is not only steeped in historical significance, which EWU is committed to preserving, but is also strategically situated near the center of campus. This central position enhances accessibility to the various student services programs housed within for the broader EWU community. Additionally, its proximity to the historic One Room School House fosters a meaningful connection between the Department of Education and EWU’s beginnings in 1890 as the first institution in Washington for teacher instruction.

Arevalo Student Mall

One Room School House

Campus Context Site Map

4.2.2 SITE STUDIES

The university is in the process of procuring the following site studies, which are scheduled to be completed during the Schematic Design phase:

- Environmental Survey Assessment
- Site Topographical & Utility Survey
- Geo Technical Survey
- Traffic Impact Survey

Cheney, Washington, experiences a diverse range of weather throughout the year and features an average of 220-250 days of sun with strong prevailing winds coming from the west and southwest primarily. The existing site has excellent solar access to the south for the proposed photovoltaic system. The building and landscape features will be designed to help shelter entries and outdoor space from inclement weather and wind.

Solar & Wind Study of Existing Martin Williamson

4.2.3 BUILDING AND SITE RELATIONSHIP

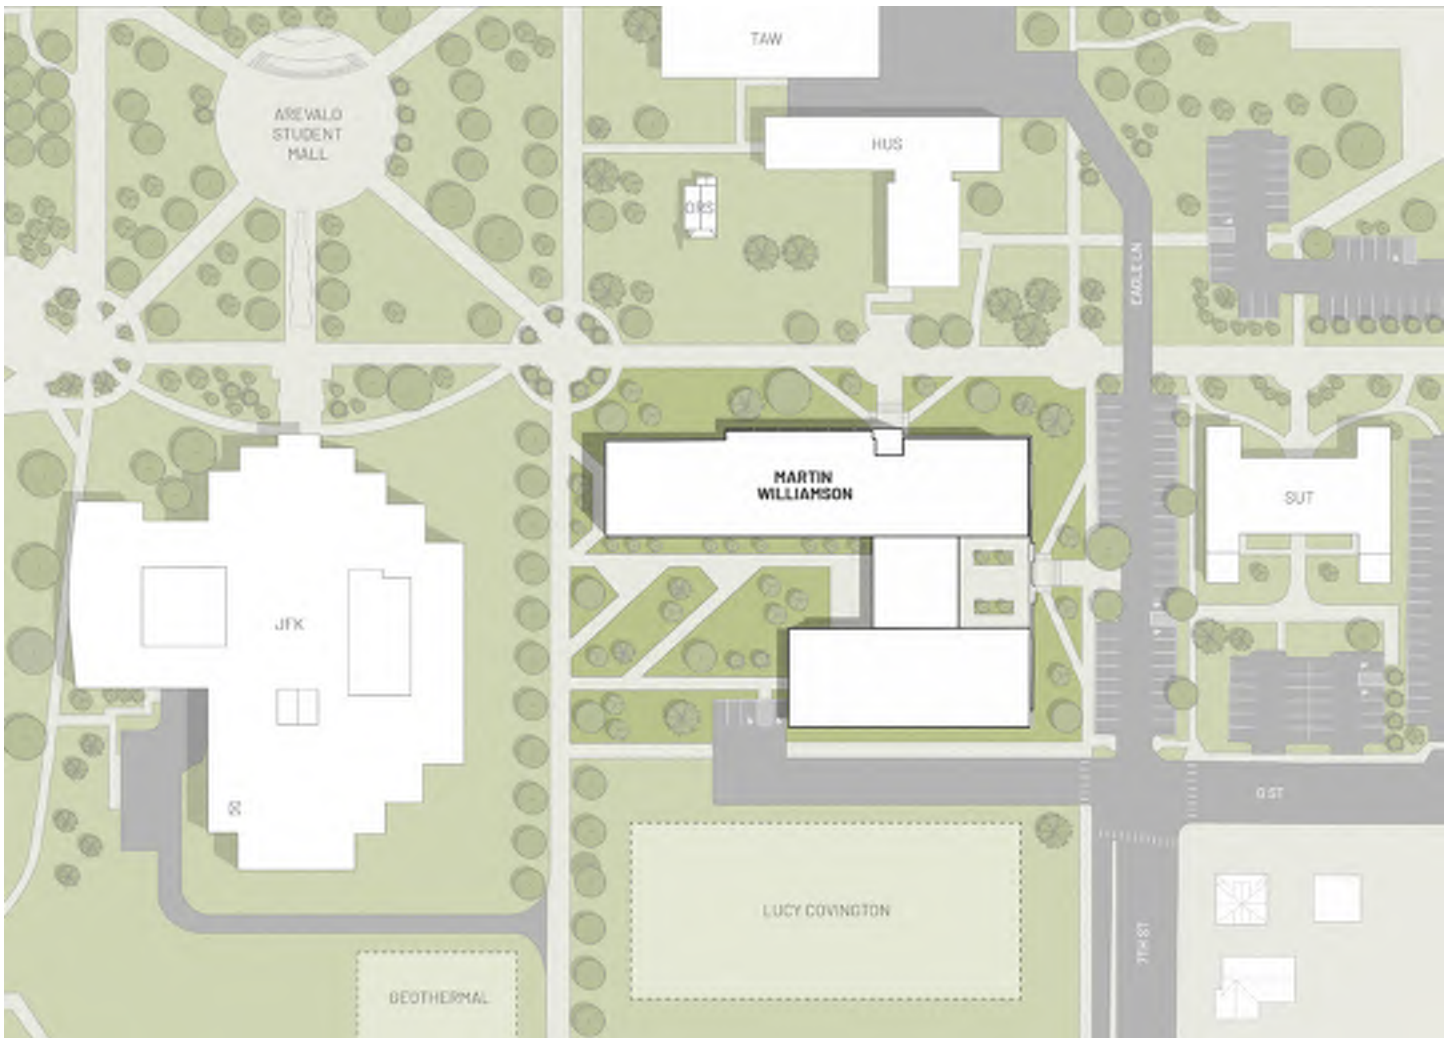

The proposed renovation of Martin Williamson Hall improves key site relationships while retaining significant historical features of Martin Hall.

**Preserved Existing Relationships:**

- The renovation retains the historic presence and connection to the central campus mall.
- This location retains the proximity and visual connection between the Department of Education and the historic One Room School House.
- The renovation retains two prominent ornate historic Martin Hall entries at the northeast and southeast facades.

**New Site Relationships:**

- The renovation improves the sense of entry and welcome at the prominent northwest building corner addressing the central campus mall.
- Safety and security in landscape and outdoor spaces is improved through a more open and visible connection to outdoor spaces.
- The preferred alternative offers a new outdoor experience through a courtyard at the southeast historic entry that is protected from the prevailing winds and harsh solar exposure during warm weather months.
- The renovation improves visibility to and from campus core toward the south which welcomes and draws activity to the campus core.

*Proposed Site Plan*

*Northwest Corner - Approach from Student Mall*

*Southwest Corner - Approach from Computing & Engineering Building*

*Southeast Corner - Approach from Parking*

*Campus Courtyard - View Through Glass Gasket*

*Entry Courtyard - View Through Historic Facade*

#### 4.2.4 WATER RIGHTS AND AVAILABILITY

The buildings are within the EWU campus and are served by the University's private water system. Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet. Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of your tap water, backflow assemblies are installed through the campus to protect our water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements. A report is submitted to the Department of Health each year.

EWU's water meets or exceeds all standards set for quality and safety and is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

Extension of campus water mains is not expected, new connections or reconnection to existing campus infrastructure will provide fire and domestic water to the new building.

With the use of modern, low flow plumbing fixtures in the new buildings, a reduction in water use may be expected.

Sanitary sewer connections from the building will be to campus sewer mains, replacing the existing connections.

#### 4.2.5 STORM WATER REQUIREMENTS

The University is within the City of Cheney, which uses the Spokane Regional Stormwater Manual, currently the April 2008 edition, to guide stormwater design. Given the age of these buildings predating any formal storm water design standards, the reconstruction within the approximate footprint, and to the same amount (or less) of impervious area, no extraordinary measures are expected to be needed for mitigation. A detention or infiltration system should not be required, see below for a discussion of water collection and reuse.

If new and replaced pollution generating surfaces (typically motor vehicle drives and parking) exceeding 5,000-sf are created as part of this project, a water quality system will be needed to treat the water before it's discharged to the campus storm water system.

The campus has an initiative to collect water from roof areas in winter and store it in cisterns to be use in summer months for irrigation. If desired, a cistern could be constructed under part of the proposed pedestrian plaza at the building. This is not a required program but has been implemented in other recent campus projects.

To obtain LEED storm water points, the project would need to infiltrate or reuse (irrigation) most of the surface water collected from precipitation.

#### 4.2.6 SITE OWNERSHIP, EASEMENTS AND ACQUISITION

The project site is on the Eastern Washington University campus utilizing the existing site. There would be no change of ownership, acquisition, or easements needed.

#### 4.2.7 SETBACK REQUIREMENTS

The project site is totally within the existing campus, it has no frontage on public streets. With the preservation of the historic façade, no effect on setbacks is expected. To the west and south, where new building façades will be constructed, adjacency to campus walks and drives should be reviewed for visibility of pedestrians and drivers.

#### 4.2.8 NEIGHBORHOOD ISSUES (CONSTRUCTION RELATED)

The site is within the Campus and should not directly affect off campus neighbors. If the old Reid school site is used for a construction yard, the opposite side of 7th St. is a residential neighborhood. The potential for temporary disruption, noise, dust, extra vehicular trips, and deliveries is possible. Location of the construction activity to the west and north ends of this lot will help separate the residents from the temporary disturbance.

#### 4.2.9 NEIGHBORHOOD ISSUES (LONG TERM)

When the project is complete, the use will not change, the building will remain an education and administration facility for the university. Vehicular and pedestrian traffic patterns, rates and frequency should remain similar to current conditions.

#### 4.2.10 UTILITY CONNECTIONS

Buried campus owned primary power lines traverse the western boundary and central core of the site. The central core existing lines appear to be in conflict with the planned location of the building. Buried primary service lines will be relocated and extended from the existing campus infrastructure for new services to the building. An existing pad mounted line switch is located in the middle of the site and will require coordination with site landscape to protect in place.

Buried campus communications lines traverse the western boundary and central core of the site. The central core existing active lines appear to be in conflict with the planned location of the building. Buried comm service lines will be relocated and extended from the existing campus infrastructure for services to the building.

All existing utilities to the campus mains are expected to be re-connected, Water, sewer, storm are in individual buried pipe mains under the streets and walks around the site. Reconnection to existing points of service is expected.

A Campus utility tunnel is located west of Williamson, under the drive between this site and the JFK library. These campus utility tunnels usually contain power, communications, steam, and chilled water. All likely have connection from this tunnel to at least the Williamson Building, and likely to both buildings. Reconnection of the new building to these services would be expected from the campus mains in the existing tunnel.

The campus has a central chilled water plant and central steam plant that distributes chilled water, steam, and steam condensate to the buildings on campus through an underground tunnel system.

The campus tunnel system traverses east-to-west immediately northwest of the proposed Lucy Covington project site and should be protected in place. Chilled water will be provided to the building via an extension to the existing tunnel system to the new building. New dedicated 6"Ø chilled water supply and return piping will be routed through the tunnel to the new building.

The building heating and domestic hot water will be provided by a connection to a new campus low temperature heating water (LTHW) system, which will operate at 120°F. The LTHW will be generated by a new open-source ground coupled heat pump heating plant. The plant is being planned as a separate project. Dedicated 6"Ø low temperature hot water piping will be routed to this building via an extension of the tunnel system or utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.

**Site Paving:**

Site paving will consist of asphalt and concrete per university standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces.

Asphalt for restored parking areas and new loading/utility yard, assume 6-in of ½-in HMA over 6-in Crushed base.

Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement.

At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

**Fire Truck Access:**

Fire truck access can be provided off the parking lot on the east side, at Eagle Lane and from 7th Street. Per a campus fire improvement study from 2007, the walks to the north and west are scheduled to be widened to 20-ft accommodating fire trucks. There are 4 existing fire hydrants within a 300-foot radius of the proposed building. These hydrants are near the corners of the complex.

**Water Supply:**

Water mains: Existing Campus water mains are to the west, north and east faces of the buildings, No relocation or extension of existing mains is expected due to this construction.

A single combined fire and domestic water service will be provided to the building from the University system water line. Analysis from the plumbing and fire design will be required to determine the size of the services for the new building.

**Water Meter:** An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria.

**Sanitary Sewer:**

All floors of the addition m should be able to discharge waste by gravity to the campus sanitary sewer system located off the south edge of the site. At least one new 6-in connection to this system is anticipated, reuse of existing side sewers may be possible, depending on condition and location relative to the new facility.

**Stormwater Treatment and Disposal:**

The University’s stormwater system drains to the City of Cheney’s public storm system. Development of this addition will conform to the City’s current surface water development manual which specifies stormwater design standards. The city has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley.

Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the local campus system. If new and replaced vehicular use pavements exceed 5,000-sf within this project, the water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

**Stormwater flow control system:**

Martin Hall dates from 1937, and Williamson from 1966, both buildings predate the writing and adoption of any drainage codes. The water from these roofs flows into the local campus system and into the city storm mains with no flow control. This condition is grandfathered and given that the new building and associated paving will be approximately the same footprint, flow control (detention) is not required.

If LEED or other sustainable practices are desired, several options may be available to obtain stormwater points for the redeveloped site. For LEED points, most of the water needs to be either infiltrated, or re-used within the LEED boundary.

**Infiltration**

The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Drywells have been used on campus at many of the buildings, overflow from them could be routed to the local storm drains. Verification of local soil infiltration by percolation testing is recommended.

**Cistern to collect precipitation for reuse:**

Collection and holding water in winter for use later in the year is another possible storm water strategy, one nearby objective is to collect water under the quad from nearby buildings. Setting their new building up for such a system may be possible. Alternatively, a cistern could be constructed below the new plaza, with the possibility of reusing storm water for irrigation or other gray water uses.

**Foundation Subdrainage:** A footing and slab drainage system will likely be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system is under the pedestrian plaza north of Martin Hall, and flows east and south to city systems.

**Connection to Campus Utility Tunnel:**

West of the site, under the brick pedestrian walk, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. Below grade, the new building will not directly affect the tunnel. Connection/reconnection to these utilities, through the existing points of connection in the tunnel are expected.

**Future Geothermal Heating**

The campus is developing plans for district heating from deep well geothermal systems. Under a separate project, a network of wells and heat exchangers would be installed nearby and a new low temperature looped pipe network to heat buildings, with low or no carbon footprint.

Depending on the timing of the different projects, partial or full installation of such a system may be warranted in the new Martin-Williamson facility. See mechanical discussion for more detail on such a system.

**Gas Distribution:**

Natural gas service to the campus is provided to the existing buildings by Avista Utilities, most new and renovated buildings on campus are not being reconnected to natural gas.

**4.2.11 POTENTIAL ENVIRONMENTAL IMPACTS**

Given that this proposed project is on a developed site, which has been an active part of the EWU campus for nearly 100-years, no environmental impacts are expected.

No mapped wetlands or other water bodies are near this portion of campus.

There are no shorelines near this area.

A SEPA application will be required for this project.

While under construction, the project will need coverage under the State DOE Construction Stormwater General Permit.

**4.2.12 PARKING AND ACCESS**

There is no significant parking directly associated with either of these buildings, most student parking is clustered around the perimeters of campus, within walking distance of the campus core. About 20 stalls are along the west edge of Eagle Lane, to the east side of Martin Hall. These stalls are not specifically designated for Martin Hall users. Current proposed design does not appear to affect these stalls.

At the south end of Williamson, is a small service/delivery area, with two ADA stalls and a campus service stall. A small dumpster corral is part of this installation.

Allowance for a service area, for deliveries and trash staging should be included in the site design of the new complex.

A location to accommodate the needs of the building, and possibly designed with the potential to be expanded to the old Reid School site when it's redeveloped. A shared service/delivery area would be more economical and use less campus area than separate service/loading/waste facilities for each building.

#### 4.2.13 IMPACT ON SURROUNDINGS DURING CONSTRUCTION

##### **Site Preparation and Excavation:**

Demolition will include removal of both buildings and foundations, leaving the façade of Martin Hall on the north and east faces. Existing utilities will be capped at the edge of work and left for reconnection. All demolished materials will be removed from site, reused, recycled or discarded, in appropriate, legal locations. Site preparation for the project will include removal of the existing paving and miscellaneous site features in the work area.

The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not acceptable for use as structural fill and will be hauled off site. Some large trees very near the buildings and future construction will need to be removed to construct the new facility, and for future maintenance access to the façade.

##### **Temporary Sediment and Erosion Control:**

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks at the site.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction. The size of this project will trigger coverage under the DOE's Construction General Stormwater Permit, with it's record keeping and reporting requirements for quality of water discharged from the construction site.

##### **Temporary Construction Features:**

During construction, site access is expected to be from the empty lot south of the Martin-Williamson site, across the former Reid School parcel. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs. Quarry spall work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

##### **Construction Debris:**

The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from leaving the work areas, or entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

##### **Temporary Construction Impacts:**

Assuming the old Reid School site is used for contractor operations (office trailers, deliveries, staging, laydown, stockpiles, etc.) site access may try to come from the highway, through the town of Cheney, on G or H streets, to campus. This is mostly a residential neighborhood, added large vehicle traffic will be a temporary disturbance to the community. An more desirable alternate path up Washington St. to J/7th Ave. avoids most of the residential area, and runs through the interface between the city and campus areas. Other effects to the surrounding community may be dust which can be mitigated with watering trucks, and temporary ground cover (either straw or mulch) on bare, unworked, soil areas. Fences with fabric panels can help control dust also.

Noise from construction equipment and operations will likely be an issue for both the on and off-campus communities. From demolition through finished building, louder than normal, and sharp, abrupt, noises can be expected. The primary means of noise control will be limiting work hours to normal workdays and hours, as defined by the city.

4.3 CONSISTENCY WITH APPLICABLE LONG-TERM PLANS

Eastern Washington University has plans to revisit their Campus Master Plan starting summer of 2024 and the renovation of Martin Williamson Hall will remain a critical component of their future planning. The Eastern Washington University Comprehensive Master Plan identifies five planning principles that align with the proposed renovation of Martin Williamson. The planning principles and how they are implemented (In Italics) in the design of Martin Williamson are as follows:

**PLANNING PRINCIPLES**

- Carefully evaluate each project with regard to renovation versus replacement opportunities

*Careful consideration was given to the decision of renovation versus replacement of Martin Williamson. Ultimately, to support the mission and areas needed by the programs housed within, preserving the existing building was not feasible. Previous predesign requests to replace the project have not received funding.*

- Locate and size all new or replacement buildings to optimize site utilization

*The proximity of Martin Williamson in the heart of campus is ideal as 2 or 7 student support services areas (SASS and Counseling and Wellness) are housed within. Additionally it is directly proximate and provides visual connection to the Cheney Normal School Heritage Center (one rooms school house) that represents EWU's beginnings in 1890 as the first institution in Washington for teacher instruction.*

- Improve the overall character of the campus with the implementation of each project

*Martin Williamson has had multiple renovations over its lifetime and very little historical significance exists except for the facade of Martin Hall. With the complete demo and reuse of the facade, this allows the project to incorporate EWU's current design guidelines and improve the overall character of campus.*

- Create and follow a framework that welcomes EWU's neighbors and accommodates future campus expansion beyond existing boundaries

*The campus is only a few blocks from downtown Cheney. The building is designed to provide easy access from both the parking and neighborhoods as well as the campus spine. Green space around the project was maximized to the fullest extent possible.*

- Reinforce and improve the overall cohesion of campus, specifically linkages across Washington Street, whenever possible

*The existing Martin Williamson building has deep roots in the existing campus fabric. Preservation of the existing facade of Martin Hall was prioritized as part of the design effort to ensure its legacy while still creating an outstanding learning environment that supports students success and reflects the hopes and aspirations of the Programs within and the larger EWU community.*

*Southeast aerial view of campus Circa 1960*

#### 4.4 REGULATORY FACTORS

##### 4.4.1 PERFORMANCE PUBLIC BUILDINGS

High Performance Buildings (Chapter 39.35D RCW)

Eastern Washington University has a proven track dating back to 2008 of designing and constructing high-performance buildings using the LEED rating system. This project will select design consultants who embody EWU’s sustainability objectives. This project will be designed, constructed, and certified to the LEED Silver Standard, as a minimum, in accordance with RCW 39.35D. A LEED Checklist, outlining a preliminary approach, has been included in the Appendix. EWU has had a history of achieving LEED silver or higher and will strive to achieve LEED gold on this project.

##### 4.4.2 ZERO ENERGY BUILDINGS

State Efficiency and Environmental Performance (Executive Order 20-01)

The Governor’s Executive Order 20-01 mandates high performance buildings for reduction of greenhouse gases, reduction of pollutants from fossil fuels, and the use of clean energy when technically and economically feasible. Eastern Washington University acknowledges that the costs of constructing zero energy or zero energy capable buildings are nearing parity with conventional buildings. Consequently, the university will further progress its building construction endeavors toward this directive, employing life-cycle cost analysis tools to inform decision-making throughout the design process. The life-cycle cost analysis performed as part of this pre-design included the evaluation of a net zero building. In studying the use of photovoltaic (PV) solar panels for on-site renewable energy generation, the required area of PV panels exceeded the available roof area and would require additional dedicated site area.

EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

### 4.4.3 GREENHOUSE GAS REDUCTION

#### 4.4.3-1 STATE LIMITS

Greenhouse Gas Emissions Policy (RCW 70A.45.070)

The referenced Revised Code of Washington regarding the greenhouse gas emissions reductions requires all state agencies to reduce greenhouse gas emissions as follows:

- i. By 2020 to 1990 levels.
- ii. By 2030 to forty-five percent below 1990 levels.
- iii. By 2040 to seventy percent below 1990 levels.
- iv. By 2050 to ninety-five percent below 1990 levels.

Part of the University's strategy to cut greenhouse gas emissions involves decreasing reliance on fossil fuels for building energy. The incorporation of energy-efficient HVAC, plumbing, and electrical systems in this proposed facility is crucial for advancing the campus's goal of reducing overall fossil fuel usage. Given that major capital projects are typically significant energy consumers, prioritizing energy efficiency in the new facility is particularly important.

This project is unique for EWU as it intends to utilize a new all electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers.

EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

### 4.4.4 ARCHAEOLOGICAL AND CULTURAL RESOURCES

In adherence with Executive Order 21-02 and Section 106 of the National Historic Preservation Act of 1966, EWU has initiated consultation with the Washington State Department of Archaeology and Historic Preservation (DAHP), and the Coeur d'Alene, Colville and Spokane Tribes Preservation Programs. The university is committed to working with DAHP throughout the design phase to address historical and cultural resource impacts this proposed project may identify. All proposed construction will be on previously disturbed ground, therefore we do not anticipate any archaeological resources will be uncovered as part of this work. Project specifications will include requirements for an Inadvertent Discovery Plan (IDP) should any artifacts or remains be discovered during excavation.

This project has been remodeled numerous times over the years and much of the historic character has been removed.

### 4.4.5 CLEAN BUILDING ACT

State Energy Standards for Clean Buildings (RCW 19.27A.210)

The Department of Commerce, through RCW 19.27A.210, has developed standards for reducing greenhouse gas emissions from the building sector as published in the Washington State Clean Buildings Performance Standard (2021). The Clean Building Performance Standard has established energy use intensity targets. This building is anticipated to exceed the 50,000 square feet threshold for Tier 1 Buildings, mandating compliance on the building level. EWU monitors their Energy Use Intensity (EUI) as a campus and has been evaluating their overall EUI in relation to the Washington State Clean Building Performance Standard, with a target campus EUI of 112.2. The preferred building option and energy package of this pre-design is anticipated to reduce the campus' comprehensive EUI from the current value of 118.4 to 111 kBtu/(SF-year), more than a 6% reduction in the campus

EUI. This EUI reduction attributed to the preferred option and energy package is anticipated to bring the campus EUI within the requirements of the Clean Building Performance Standard target EUI of 112.2 kBtu/(SF-year).

As of March 15, 2024, the 2021 Edition of the Washington State Energy Code has been implemented. The project will follow the State Energy Code in place at the time the building is permitted. With progressively more aggressive energy requirements, alongside the phase-out of fossil fuels, facilities will progress towards reducing energy consumption and associated greenhouse gas emissions, as outlined in the Greenhouse Gas Emissions Policy.

#### 4.4.6 VEHICLE CHARGING CAPABILITIES

Vehicle Charging Capability (RCW 19.28)

Where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

#### 4.4.7 AMERICANS WITH DISABILITIES ACT

The purpose of the Americans with Disability Act is to prohibit discrimination based on disability in employment, State and local government, public accommodations, commercial facilities, transportation, and telecommunications. ADA Title II requires that State and local governments provide people with disabilities an equal opportunity to benefit from all the programs, services, and activities (e.g., public education, employment, transportation, recreation, health care, social services, courts, voting and town meetings). This project will adhere to the State requirements for ADA. This project provides ADA parking spaces complete with new ADA compliant walkways/ramps at all building entrances.

#### 4.4.8 PLANNING COMPLIANCE

City of Cheney, Comprehensive Plan

#### 4.4.9 INFORMATION REQUIRED BY RCW 43.88.03.01(1)

The new Martin Williamson is planned in accordance with the Growth Management Act (GMA) RCW 36.70A as required by RCW 43.88.0301(1). The proposed project fully complies with the city's comprehensive plan and zoning codes.

#### 4.4.10 OTHER CODES OR REGULATIONS

City of Cheney Comprehensive Plan

Washington State Environmental Policy Act (SEPA)

State of Washington Department of General Administration – Leadership in Energy and Environmental Design (LEED) – Quality Assurance Process Guidelines for State Agency/College and University Facilities.

### 4.5 PROBLEMS REQUIRING FURTHER STUDY

An additional Site Survey will be required to verify existing utility locations on-site to confirm exact locations of existing infrastructure.

#### Geothermal Infrastructure Study:

Central Geothermal Plant: As part of a separate project, Eastern Washington University will be building a new open source geothermal heating plant. The heating plant will generate heating hot water for building heating and domestic hot water generation.

Funding for this new central plant will be requested separately from this project and is the primary source of heating and domestic hot water generation for this project. If this central plant is not funded alongside this project, an alternative means of heating and domestic hot water generation for the building will be required.

#### 4.6 REQUIREMENTS IN EXCESS OF EXISTING CODE

No items have been identified.

#### 4.7 TECHNOLOGY INFRASTRUCTURE INVESTMENTS

Campus owned outside plant cabling will be provided to the building from the existing campus IT infrastructure. New site communications pathways will be provided to connect the new facility to the existing site utility pathways near the site. Communications rooms will be located throughout the new facility in accordance with EIA/TIA 568 and 569. The main telecom room will be located on the ground level of the building. Each floor of the building will be provided with a minimum of (1) closet. Additional communications rooms will be provided on each floor as needed to ensure that all horizontal station cabling distances will be less than 295 feet from the nearest closet. Cable trays will be provided at accessible ceilings on each floor to support horizontal cabling distribution.

#### 4.8 SECURITY

The site is within the existing campus and will be subject to existing campus security protocols. Pole mounted lighting on the site will be provided for pedestrian walkways and parking areas to support site-related campus security goals. Site lighting illumination levels will be in compliance with IES guidelines and EWU campus standards.

#### 4.9 COMMISSIONING

Eastern Washington University will engage a third-party commissioning agent to oversee the project commissioning, adhering to WAC 51-115C-4801 and LEED criteria for energy and water systems. The appointed consultant shall be a member of the Building Commissioning Association and the U.S. Green Building Council and will serve as the University's Commissioning Authority. Their services will enhance the facility's value, bolster maintainability, conserve energy, and enhance indoor environmental quality. Alongside meeting Washington State Energy code and LEED Enhanced Commissioning standards, the agent will also undertake the following responsibilities:

- Development of a commissioning plan.
- Identification of all the roles of the project members, including the University, the Architect/Engineering Consultants, sub-consultants, contractors, and sub-contractors.
- The plan will identify the needs of Eastern Washington University to ensure that functional building requirements are met and to establish the project design intent.
- The commissioning process will begin in the early phases of design and continue through construction to final completion, final acceptance, and the warranty phase.
- Commissioning services will include but not be limited to the following areas of the building operations: energy monitoring, building automation and energy management systems, heating, ventilating and air conditioning systems, lighting controls, plumbing, domestic heating water system, HVAC heating and cooling systems, building enclosure, and renewable power systems.
- In addition to Enhanced Commissioning, Envelope Commissioning as outlined in LEED should be considered.

4.10 FUTURE PHASING

The proposed project includes the necessary areas for the included programs and does not assume any future phasing. Adequate infrastructure is provided to accommodate a future Geothermal connection to the building.

4.11 PROJECT DELIVERY METHODS

4.11.1 DELIVERY METHOD COMPARISON

The project is not pursuing an alternative delivery method. The proposed project does not meet the GCCM or Design Build requirements outlined in RCW 39.10. Both of these delivery methods can be effective, but they would incur additional preconstruction fees for contractor involvement early in the design.

The project will use the Design-Bid-Build (DBB) project delivery method per RCW 39.04 – Public works. This is the delivery method that is most frequently used by Eastern Washington University. The school is familiar and experienced with this delivery method and has found that it has been the most cost-effective by promoting competitive bidding between interested general contractors and subcontractors.

| Position                            | Time On Project | Duties:   |
|-------------------------------------|-----------------|---|
| Director of Construction & Planning | 15%             | Oversees project planning and implementation for campus         |
| Sr. Project Manager                 | 85%             | Supervises construction implementation and project coordination |
| Construction Project Coordinator    | 45%             | Assists with project coordination for campus                    |
| Office Assistant                    | 15%             | Assists with administrative tasks for project                   |
| <b>Totals</b>                       | <b>160%</b>     |   |

4.11.2 MANAGEMENT ORGANIZATION WITHIN THE AGENCY

Eastern Washington University’s Construction and Planning Division will manage all aspects of the project from programming and initial budgeting of the proposed project to the initial selection of the project architect/engineer(A/E) consultant design team and throughout the subsequent design, bidding, construction, commissioning, and warranty phases. The Construction and Planning Division will oversee the required contractual administration for the project architect/engineer (A/E) consultants and public works contractors. The Construction and Planning team is responsible to work closely with the university’s administration, the design team, and the contractors to ensure the project is delivered on time and within budget.

4.12 SCHEDULE

4.12.1 MILESTONE SCHEDULE

Eastern Washington University Martin Williamson Schedule

Schedule Highlights

- Design for Phase 1 and Phase 2 to occur simultaneously so a complete set of documents for both phases will be completed and permitted at the end of the 2025-2027 Bienium.
- Construction for Phase 1 proposed in the 2027-2029 Bienium
- Construction for Phase 2 proposed in the 2029-2031 Bienium

#### 4.12.2 VALUE ENGINEERING AND ANALYSIS

The project schedule includes time for both a Value Engineering (VE) study and a Constructibility review. The VE study will take place at the end of the Design Development phase and will allow the project team to better understand what project saving opportunities can be found. The Constructibility study will take place at the midpoint of the Construction Documents phase and will be complete with enough time to be incorporated into the building permit submission.

#### 4.12.3 POTENTIAL FACTORS THAT MAY DELAY SCHEDULE

There are no known factors that are expected to delay the design or permitting of the project. The construction schedule may be affected by current supply chain challenges. The project team will mitigate any delays by identifying long lead time items early and will be responsive to allow for early procurement where it is feasible.

The project schedule would be delayed if construction funding is not allotted in the 2027-29 and 2029-2031 bienniums and postponed to a future biennium. This would likely increase project costs due escalation. Costs would likely also increase beyond the standard escalation rates due to potential design and document revisions for code changes, and project restart fees.

#### 4.12.4 LOCAL JURISDICTION COORDINATION

The Authority Having Jurisdiction is the City of Cheney. The project team has already begun coordination with the permitting agencies to better understand the site access and zoning parameters. The team will continue to work with the city to ensure that all development requirements are met and that the required permits are obtained in a timely manner.

# SECTION 5

## BUDGET ANALYSIS

## 5.0 BUDGET ANALYSIS OF PREFERRED ALTERNATIVE

### 5.1 COST ESTIMATE

#### 5.1.1 MAJOR ASSUMPTIONS

##### Phasing – Alternative C – Historic Screen

Construction of this project will occur in two phases. The first phase will include all Division 21, 22, and 23 wet infrastructures sized for both phases. Phase 1 infrastructure to include fire service and riser, domestic water service and backflow prevention, hydronic heating water service and system components, and hydronic chilled water service and system components. Fire, domestic hot and cold water mains, and hydronic mains will be sized and located for connection in phase 2. Sanitary sewer, roof drainage, and air distribution systems will be appropriately sized only for the phase they are installed.

##### Energy System Evaluations

As part of the pre-design, three comprehensive energy packages were studied in the preferred Concept C concept. These three packages are referred to as the Base Package, High Performance Package, and the Net Zero Package. Specific system components studied in each of the three options as follows:

###### Base Package

- 124,375 sf new building using two existing exterior facades
- Chilled beams with 68% effective heat recovery for ventilation airflow
- 10% better than WSEC required Lighting power density (LPD)
- Ground coupled heat pump plant for LTHW, chilled water (CW), and domestic hot water (DHW)
- 62 kW photovoltaic (PV) system to meet WSEC requirement of 0.5 Watts (W) per square foot

###### High Performance Package

- Base Package with the following changes:
- 75% effective heat recovery for ventilation airflow
- Displacement ventilation HVAC system for large lecture hall style classroom
- Radiant floor heating and cooling for first floor corridor
- 15% better than WSEC required LPD
- 124 kW PV system

###### Net Zero Package

- High Performance Package with the following changes:
- 90% effective heat recovery for ventilation airflow
- Low pressure ductwork reducing fan power
- 20% better than WSEC required LPD
- High performance glazing (U-Value: 0.28 / SHGC 0.22)
- Horizontal shading on South facing windows
- Vertical shading on East and West facing windows
- 547 kW PV system

Energy results from the Energy Life Cycle Cost Analysis looking at the three concepts and the three energy packages studied within Concept C can be found below. From this study, the preferred option for Concept C is the High Performance energy package. This decision is in response to its impact on bringing the campus EUI within the EUI target required by the Clean Building Performance Standard, and the increased life cycle costs and additional site area required for the on-site renewable energy created by PV.

**A10: Foundations:**

The foundations for new construction will include continuous and spread footings, and perimeter drainage. The existing building’s first floor is a concrete framed floor over a crawlspace. After this floor is demolished, structural fill will be brought in to raise grade for a concrete slab on grade.

**B10: Superstructure:**

At new construction, roof structure will be composed of 1 ½” metal roof deck on steel beams, supported on steel girders and steel columns. Second floor construction will be 5 ½” composite concrete deck supported on composite steel beams and girders, supported on steel columns.

**CLT Option:**

At new construction, roof structure will be composed of 3-ply CLT supported on glulam beams at roughly 14 feet on center, supported on glulam girders and steel columns. Second floor construction will be 5 ½” composite concrete deck supported on composite steel beams and girders, supported on steel columns.

We anticipate the lateral force system for either option will be either CMU shear walls or concentric steel braced frames. It is likely that one or two building joints will be required.

#### **B20: Exterior enclosure:**

Scope of work includes masonry brick veneer and insulated metal panel. The extent of brick will be approximately 80% and 20% insulated metal panels at opaque walls. Glazing scope includes curtain wall and storefront glazing. The extent of the glazing would vary by exposure from approximately 20% to 30% of the gross wall at the existing northeast and southeast facades to 30/40% at classroom, research, offices, Counseling and Student Support Services areas and 40% /80% at circulation/student areas. Other scope would include exterior sunshades. Exterior door scope will include glazed aluminum doors at vestibules and hollow metal doors at other locations.

The existing exterior masonry wall will be shored and braced (design by general contractor) to allow demolition of the existing 1st floor, second floor and roof structure beyond. This bracing system will remain in place until the new structure and lateral system is erected, and the existing wall system is properly tied to the new framing.

#### **B30: Roofing:**

Roof scope of work includes an Built-Up Roofing system with insulation (R-Value at 20% better than code), sheet metal flashings, and rough carpentry. Additional scope includes roof ladders, roof hatch, skylights, and fall restraint anchors.

#### **C10: Interior Construction:**

Interior partitions will consist of metal stud framing, batt insulation and gypsum board, interior glazing, and interior doors. Fittings and specialties will include toilet partitions, white boards, signage, corner guards, miscellaneous, restroom and shower accessories, fire extinguishers and cabinets.

#### **C20: Stairs**

Main stair included HSS tube steel structure with polished precast concrete treads and landings, and aluminum, glass, or cable rail guardrail and decorative stainless-steel railing. Back-of-house stairs will have channel stringers and concrete filled metal pan treads with composite concrete decks at landings and painted guardrail.

#### **C30: Interior Finishes**

Floor finishes include porcelain tile at restrooms, carpet tile and/or resilient flooring in classrooms, counseling, offices, and student support areas, and polished concrete in corridors and large shared or common areas. MEP rooms and storage will be sealed concrete. Ceiling finishes will include ACT, painted GWB, wood beams exposed to structure, acoustical baffles, as well as linear wood grilles.

#### **D10: Conveying systems**

One 3500lb 3-stop hydraulic elevator with motor and adjacent pump is included for access to all floor levels. Elevator to accommodate an ambulance stretcher.

#### **D20: Plumbing**

##### General

The building plumbing systems will comply with Eastern Washington University's campus standards. Water conservation is a high regional priority for Cheney and low consumption fixtures and water conservation strategies shall be employed to provide optimal efficiency and high performance to minimize maintenance.

### Water

Domestic cold water distribution systems will be provided throughout the building. Backflow prevention assemblies will be provided for the system in accordance with the AWWA Backflow Prevention and Control Manual and reviewed with the Cheney Water Division and will be located in the ground floor mechanical room.

A domestic hot water distribution system will be provided throughout the building. Hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F. A hot water recirculation system, controlled through the campus building automation system (BAS), will be provided, and distributed at low velocities, using in-line all-bronze circulating pumps throughout the building.

#### Materials:

- Water Piping: Copper Type L

### Sanitary Waste System

A gravity sanitary sewer system will be utilized for all flushing and flow fixtures with drain connections. All waste systems will discharge five feet outside the building for connection to the site sanitary sewer.

#### Materials:

- Drain, Waste, Vent Piping (above grade) : Cast Iron
- Waste Piping (below grade): PVC, ABS, or cast Iron

### Rainwater Drainage

Gravity primary and overflow storm drainage systems that will be piped with interior roof drain leaders to a point five feet outside the building for connection to the site storm drainage system. Overflow drains will terminate at grade level on splash blocks.

#### Materials:

- Storm Drain Piping (above grade): Cast Iron
- Storm Drain Piping (below grade): PVC, ABS, Cast Iron

### Other Plumbing Systems

At a minimum, isolation valves will be provided for plumbing systems at each floor, at all branch take-offs to individual fixture groups, and each restroom (men's, women's, and gender neutral) with individual isolation valves located on the same floor and within easy access.

Elevator pits will be provided with sump pumps, to comply with Washington L&I requirements, and piped to the sanitary sewer system.

## **D30: Heating, Ventilation and Air Conditioning (HVAC)**

### General

The building HVAC Systems shall comply with Eastern Washington University's campus standards. The proposed mechanical systems are designed for a balance between high energy performance, flexibility, and low maintenance. Systems with the lowest anticipated energy use are proposed. Campus utilities will be metered and interfaced with the Division 23 building automation system.

Outdoor Design Conditions: Heating Systems will be sized for the ASHRAE median of extremes for Cheney, Washington which is -9°F. Cooling systems will be sized for the ASHRAE 0.1% design condition temperature for Cheney, Washington which is 99°F dry bulb and 69°F wet bulb.

Indoor Design Conditions: When occupied, office and classroom spaces will be maintained between 68 and 75°F. Telecommunication rooms will be controlled to 68-75°F 24 hours per day, 7 days per week. Mechanical and electrical spaces will control to 55-85°F.

### Utilities

The building will be heated with low temperature water (120°F) supplied by the new open-source geothermal heating plant. LTHW will be routed to this building via 6"Ø supply and return pipes. The LTHW water will then be distributed through the building via fully redundant building heating water pumps. Air handling equipment exposed to outside air shall be serviced by a dedicated heating water system, freeze protected with 40-50% propylene glycol, separated from the campus LTHW system via a heat exchanger.

This building will be cooled from campus chilled water system, supplied by the existing chiller plant and the new open-source geothermal heating plant. Chilled water will be routed to this building via an extension to the existing tunnel system with 6"Ø supply and return pipes. The chilled water will then be distributed through the building via 60-70% redundant building chilled water pumps. All radiant floor and chilled beam systems utilizing 6-way valves shall be serviced by a dedicated tempered chilled water loop and separated from the campus chilled water system via a heat exchanger to prevent mixing of the new low temperature heating water system from the existing campus chilled water system.

### Ventilation and Exhaust Air

This building has two primary air classifications, as defined by ASHRAE. Spaces with an ASHRAE Air Classification of 1 and 2 will be ventilated in accordance with ASHRAE Standard 62.1: Ventilation and Acceptable Indoor Air Quality. Within these spaces, ventilation air will be ducted via a dedicated outside air system (DOAS). Air will be regulated to each major zone through air terminal units and returned to the unit via return air ducting and regulated from each major zone or on a floor basis using air regulating devices. Ventilation air will be adjusted based upon occupancy and space CO2 levels.

A transpired solar collector will be provided to passively heat the ventilation air before entering the air handling units for heating and cooling. The transpired solar collector will be equipped with louvers that bypass the preheat plenum when the air system is in cooling mode. All outside air intakes will be located away from exhaust vents, plumbing vents, exhaust discharges, smoking areas, loading docks, kiln exhaust, dust collectors, designed to prevent hoar frost buildup, and will take prevailing winds into consideration. Prevailing winds are predominantly from the northwest, but occasionally from the southeast.

### Space Conditioning

Radiant floor heating and cooling should be considered as the primary source of heating and cooling in the main lobby and major corridor spaces.

Supply Air Handling Units for Air Class 1 and 2 spaces: These spaces will be serviced from central dedicated outside air system (DOAS) style air handling unit with supply fans, exhaust fans, filters, chilled water cooling coils, glycol heating water heating coils, a total energy heat wheel or other style of heat recovery, and sized for ventilation needs in these spaces. The DOAS unit will recover a minimum of 68% sensible recovery effectiveness or have an enthalpy recovery ratio of not less than 60 percent at design conditions, in accordance with the 2021 Washington State Energy Code (WSEC), from the conditioned air that is exhausted from the building. Energy recovery efficiency in excess of the WSEC requirements will be considered as part of the project's energy goals. Fans shall be arranged in a fan array for N+1 redundancy, efficiency, and ease of service. Local space temperature control will be provided from active chilled beams.

Each conference room, classroom, and study space will have their own thermostat. Offices will be provided with a minimum of one thermostat for every two offices.

#### Building Automation System

The project will utilize a Direct Digital Control (DDC) system for the control of the HVAC systems, providing for heating and cooling control, peak load demand limiting and start/stop optimization. Damper and valve actuators will be electronic. Room thermostats will be an electronic adjustable type with override switch for occupant activation to occupied mode during unoccupied periods.

*Energy Management System (EMS):* The EMS controls will be compatible with EWU's campus BACnet controls. The system shall be manufactured by Alerton or Automated Logic. Controls will interface and communicate with the local network and front-end operator's terminal for the purpose of remote operation and maintenance. The EMS will include display and report real-time building systems performance data. The EMS controls will provide energy metering interface for the new water, chilled water, low temperature heating water, and electric utilities servicing the building and report to the Skyspark control system.

#### Other

The community space may offer differing hours of operation from the remainder of the building. As a result, a dedicated system should be considered for this area, such as a 4-pipe fan coil with economizer cooling.

Vibration isolation of pumps and fans will be provided. Additional acoustic considerations will include limiting duct velocities through ductwork, terminal units, and air inlets/outlets to achieve space NC, use of sound attenuators in the duct systems, and vibration isolation of mechanical equipment with spring isolators and flexible connections will also be employed.

Areas that have 24-hour process cooling loads such as the main telecommunication rooms will be cooled with systems that allow for year-round cooling and the option for economizer cooling.

The elevator machine room will have an independent stand-alone system per Washington Elevator Code requirements.

A hydronic snowmelt system will be provided for exterior walkways at main entrances and site stairs that are difficult to access with mechanical snow removal equipment. Hydronic heat for the snowmelt system will be generated from a water-to-water heat exchanger connected to the heating water system.

Air systems (supply, return, and exhaust), hydronic, and domestic hot water recirculation systems will be completely balanced in accordance with Associated Air Balance Council or National Environmental Balancing Bureau.

#### **D40: Fire Protection Systems**

The building will be fully sprinklered in accordance with NFPA-13 requirements and the Eastern Washington University Campus Standards. The systems will be a wet sprinkler system throughout the building. Piping shall be sloped to low points for drainage. The building light hazard areas (office, lecture rooms, circulation spaces) will be sprinklered to light hazard requirements. Electrical and mechanical rooms will be sprinklered to ordinary hazard group 1 requirements.

Hydrants will be coordinated with the fire department and, where required, provided in the civil scope of work.

A fire protection standpipe will be required and provided at each exit stairwell if the highest occupied level of the building exceeds 30 feet above grade.

## D50: Electrical

### Power

The building will receive electrical service from the campus owned medium voltage distribution system. New buried conduit pathways, vaults and cabling will be provided from the nearby existing campus medium voltage system to the new building service yard. A total of (2) pad mounted oil filled transformer will be installed on the site to provide normal electrical services to the building.

Electrical services will be derived from the (2) transformers with secondary voltages of 480Y/277V and 208Y/120V. The (2) services will have an estimated rating of 1600 amps and 2000 amps respectively. The main service switchboards will be housed in a dedicated main electrical room at the ground floor. The proposed dual service approach is intended to remove heat producing transformers from inside the building, which would also eliminate the need for electrical room space conditioning.

Emergency and standby power will be provided by an onsite natural gas fueled generator. Estimated generator rating is 100kW with a voltage of 480Y/277V. The generator will include separate automatic transfer switches and distribution for NEC 700 and NEC 702 power systems. The generator ATS equipment shall be housed in a dedicated electrical closet on the ground floor in close proximity to the normal electrical service room. Generator shall be located outdoors on a concrete housekeeping pad with a sound attenuated weatherproof enclosure.

The building electrical distribution will originate from a main electrical room on the ground floor. The building electrical distribution will be designed to provide separation of lighting, mechanical, and general building loads. Circuit breaker panelboards shall be provided throughout the building as required to adequately serve the associated building loads. Each telecommunications room will be provided with a dedicated 120/208V power panelboard and an equipment ground bar. Surge protection shall be provided by installing surge protection devices at the main switchboard, distribution panelboards, emergency panelboards and appropriate branch panelboard locations. All electrical feeders shall copper and installed in rigid conduit.

Branch circuit distribution within each programmatic space will be closely coordinated with the specific function of each space. Additional spare electrical capacity will be designed into each panel to accommodate future potential changes to the building program. Wall mounted surface raceway with receptacles shall be considered for spaces with workstations such as computer labs. Floor boxes will be provided within meeting rooms and classrooms as required by the program and the electrical code. All branch wiring shall copper and installed in rigid conduit.

Owner metering shall be provided for the building main electrical service equipment. Additional sub meters shall be provided for lighting, mechanical, PV system, EV charging and plug loads to allow separate metering for each end use type.

A complete system of photovoltaic arrays shall be provided for on-site renewable energy generation in compliance with the Washington State Energy Code (WSEC). In order for the building to achieve high performance goals, the solar array will be sized for a minimum system output of approximately 124kW. Potential locations for solar arrays include the building roof and site structures such as canopies.

### Lighting

Building interior and exterior lighting will LED type. Lighting illumination levels will be in conformance with IES standards. Lighting power densities will be in conformance with the Washington state energy code. Egress and exit lighting will be provided with backup power from NEC 700 emergency power.

A low voltage lighting control system shall be provided for time-based, sensor-based (both occupancy and daylight), and manual lighting control in compliance with the energy code, LEED and the building program needs. Fixtures with embedded controls shall be considered to allow for lighting zone control changes throughout the life of the building. Switching of receptacles based upon occupancy shall be provided in compliance with the energy code.

#### **D50: Communications**

Existing buried campus communications lines are in conflict with the proposed building location and will be relocated and extended as necessary. New outside plant cabling will be provided as required to serve the new building from the existing campus infrastructure. Existing pathways in close proximity to the building will be extended for connection to the building main telecom room (MDF).

Communications Distribution: Communications building distribution cabling, devices and pathways will be provided by the contractor. Communications riser cabling will be provided from the entrance location to each Communications room. Each Communications room shall be provided with a dedicated 120/208V power panelboard, branch circuits and an equipment ground bar. Communications room power panel shall be served from NEC 702 standby power.

Communication Cabling Pathways: Cable trays will be installed on each level to facilitate cabling installation. All horizontal distribution of Communications risers will occur on the main floor level. Vertical distribution of Communications risers will route vertically through the building via 4" conduit pathways between floors.

Communication Outlets: Communications outlets will be provided throughout the facility at locations such as work stations, computers, printers, projectors, lecterns and wireless access points. Horizontal station cable will be provided and routed to the nearest Communications room located on the associated floor. Category 6 copper twisted pair cabling will be routed through the communications raceway system to each communications outlet in the building. Typically, each outlet will be served with two Category 6 cables.

WiFi Systems: WiFi system pathways, station cabling and outlets will be provided by the contractor. Required locations for wireless access points will be closely coordinated with EWU. All wireless access points will be provided and installed by EWU.

Clock System: Station cabling and outlets shall be provided by the contractor for Owner furnished Owner installed digital clocks.

#### Audio Visual

Audio visual systems will be provided and installed by the contractor. Spaces requiring audio visual system shall include, but not be limited to assembly spaces, classrooms and meeting rooms. The basis of design for assembly spaces and classrooms shall be a hybrid learning classroom which will include projectors, projector screens, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, lecture capture camera and device inputs. Large meeting rooms will require a projector and screen or wall mounted display, reinforced sound and control systems. Small and medium size meeting rooms will require wall mounted display and media control systems. Computer labs will be treated as basic classrooms with either projectors and screen or wall mounted displays, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, and wireless device connectivity.

#### **D50: Security & Fire Alarm**

Distributed Antenna System (DAS): A complete distributed antenna system for emergency responder radio use is not planned for the new building. The contractor shall provide building infrastructure for a future DAS system. Upon completion of the building structure, walls and ceilings the contractor shall provide testing for responder radio coverage.

**Access Control:** A complete access control system will be provided in accordance with EWU campus standards. Required locations for miscellaneous access control devices will be closely coordinated with EWU. Typical spaces to be provided with access control include building office suite entries, exterior entries, classroom doors, MEP closets, telecom closets, and AV closets. Additional access controls shall be considered for building areas that have unique 24/7 access needs for students.

**Video Surveillance (IPCCTV):** Video Surveillance system cabling and pathways will be provided by the contractor. Contractor shall be responsible for installing Owner furnished cameras and camera mounting hardware. Required locations for IPCCTV devices will be closely coordinated with EWU. Typical spaces with IPCCTV devices include building entrances, building circulation, building exterior and parking. The installed cameras will connect to the existing campus IPCCTV network via CAT6 network cabling connections.

**Fire Alarm:** A complete battery backed addressable fire alarm system with manual pull stations, automatic detection and ADA compliant speaker/strobes will be provided throughout the facility. Initiating and annunciation devices will be installed as required by the governing codes, and in accordance with EWU campus standards. Notification devices shall be white in color and labeled ALERT to allow for dual use as mass notification. The building fire sprinkler system will be monitored by the fire alarm system for system flow and shutoff valve tampering. Central reporting capabilities will also be provided with the fire alarm system. Optical smoke imaging devices shall be considered for detection in large multi-story atriums or other large volume spaces. Fire alarm system shall be Edwards EST4 series.

#### **E10: Equipment**

The construction cost includes the supply and installation of all residential appliances to outfit staff break room and kitchenettes throughout. Also included is science prep area equipment, dishwashers, and ice machines. This also includes electrically operated projection screens and associated infrastructure.

#### **E20: Fixed Furnishings**

Fixed furnishings include walk off mats, built in casework and benches, and interior and exterior window treatments.

#### **F10: Demolition**

Major demolition as required to accommodate new construction. Preservation and shoring of the Northeast and Southeast facades to be utilized as part of the new construction.

#### **G10: Site Preparation**

##### Site Preparation and Excavation

Demolition will include removal of both buildings and foundations, leaving the façade of Martin Hall on the north and east faces. Existing utilities will be capped at the edge of work and left for reconnection. All demolished materials will be removed from site, reused, recycled or discarded, in appropriate, legal locations.

Site preparation for the project will include removal of the existing paving and miscellaneous site features in the work area. The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not acceptable for use as structural fill and will be hauled off site. Some large trees very near the buildings and future construction will need to be removed to construct the new facility, and for future maintenance access to the façade.

### Temporary Sediment and Erosion Control

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks at the site.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction.

The size of this project will trigger coverage under the DOE's Construction General Stormwater Permit, with it's record keeping and reporting requirements for quality of water discharged from the construction site.

### Temporary Construction Features

During construction, site access is expected to be from the empty lot south of the Martin-Williamson site, across the former Reid School parcel. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs.

Quarry spall work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

### Construction Debris

The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

### Foundation Subdrainage

A footing and slab drainage system will be incorporated, and discharge into the campus stormwater under adjacent walks and drives. This system discharges to the City system in 7th Street. Most areas of this campus have a thin near surface layer of porous soils, overlaying fractured and solid basalt. Depending on the depth and condition of this soil, an under-slab drainage system may be warranted for the new building. If recommended by geotechnical engineer, under-slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

## **G20: Site Improvements**

### Site Development

The building will be accessed from all four sides, vehicular access could be made from the interior campus drive to the west, as currently used, or from the east near the entry to the P1 parking lot. Facilities for service, deliveries and waste staging should be provided.

Pedestrian access will be accommodated to all four faces of the complex. The historic Martin entrances have stairs at them to access the main level of the building. Revising the stairs with integrated ramps and landings from the adjacent pedestrian walks will accommodate all users, while maintaining the general appearance of the historic entries.

### Site Paving

Site paving will consist of asphalt and concrete per university standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces. Asphalt for restored parking areas and new loading/utility yard, assume 6-in of ½-in HMA over 6-in Crushed base. Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement. At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

### Fire Truck Access

Fire truck access can be provided off the parking lot on the east side, at Eagle Lane and from 7th Street. Per a campus fire improvement study from 2007, the walks to the north and west are scheduled to be widened to 20-ft accommodating fire trucks. There are 4 existing fire hydrants within a 300-foot radius of the proposed building. These hydrants are near the corners of the complex.

### Water Supply

Water mains: Existing Campus water mains are to the west, north and east faces of the buildings, No relocation or extension of existing mains is expected due to this construction. A single combined fire and domestic water service will be provided to the building from the University system water line. Analysis from the plumbing and fire design will be required to determine the size of the services for the new building.

### Water Meter

An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria.

### Sanitary Sewer

All floors of the addition m should be able to discharge waste by gravity to the campus sanitary sewer system located off the south edge of the site. At least one new 6-in connection to this system is anticipated, reuse of existing side sewers may be possible, depending on condition and location relative to the new facility.

### Stormwater Treatment and Disposal

The University's stormwater system drains to the City of Cheney's public storm system. Development of this addition will conform to the City's current surface water development manual which specifies stormwater design standards. The city has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley. Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the local campus system. If new and replaced vehicular use pavements exceed 5,000-sf within this project, the water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

### Stormwater flow control system

Martin Hall dates from 1937, and Williamson from 1966, both buildings predate the writing and adoption of any drainage codes. The water from these roofs flows into the local campus system and into the city storm mains with no flow control. This condition is grandfathered and given that the new building and associated paving will be approximately the same footprint, flow control (detention) is not required.

If LEED or other sustainable practices are desired, several options may be available to obtain stormwater points for the redeveloped site. For LEED points, most of the water needs to be either infiltrated, or re-used within the LEED boundary.

### Infiltration

The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Drywells have been used on campus at many of the buildings, overflow from them could be routed to the local storm drains. Verification of local soil infiltration by percolation testing is recommended.

### Cistern to collect precipitation for reuse

Collection and holding water in winter for use later in the year is another possible storm water strategy, one nearby objective is to collect water under the quad from nearby buildings. Setting their new building up for such a system may be possible. Alternatively, a cistern could be constructed below the new plaza, with the possibility of reusing storm water for irrigation or other gray water uses.

### Foundation Subdrainage

A footing and slab drainage system will likely be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system is under the pedestrian plaza north of Martin Hall, and flows east and south to city systems.

### Connection to Campus Utility Tunnel

West of the site, under the brick pedestrian walk, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. Below grade, the new building will not directly affect the tunnel.

Connection/reconnection to these utilities, through the existing points of connection in the tunnel are expected.

### Future Geothermal Heating

The campus is developing plans for district heating from deep well geothermal systems. Under a separate project, a network of wells and heat exchangers would be installed nearby and a new low temperature looped pipe network to heat buildings, with low or no carbon footprint. Depending on the timing of the different projects, partial or full installation of such a system may be warranted in the new Martin-Williamson facility. See mechanical discussion for more detail on such a system.

### Gas Distribution

Natural gas service to the campus is provided to the existing buildings by Avista Utilities, most new and renovated buildings on campus are not being reconnected to natural gas.

## **G30: Landscaping and Irrigation**

Part of EWU's Landscape Master plan is to Promote Education, Demonstration, Experimentation, and Involvement. Campus landscapes and outdoor environments want to be used for teaching and research and facilitate connections between students, faculty and staff. Plantings will be selected with drought tolerance and prioritizing native species, creating a regionally appropriate campus planting palate and promoting biodiversity.

EWU has begun the implementation of a central controls system for irrigation. This will allow EWU maintenance staff to have much more oversight, and the ability to monitor and adjust irrigation timing to maximize efficiency.

5.1.2 SUMMARY TABLE

The following tables outline the cost summary of the preferred alternative. The complete C100 documents for both Phase 1 and Phase 2 and associated cost estimates are included in the Appendix.

| <b>Summary Construction Budget of Preferred Alternative</b> |                     |                     |                     |
|---|---------------------|---------------------|---------------------|
|   | <b>Phase 1</b>      | <b>Phase 2</b>      | <b>TOTAL</b>        |
| G10 - Site Preparation                                      | \$295,497           | \$313,043           | \$608,540           |
| G20 - Site Improvements                                     | \$295,245           | \$316,595           | \$611,840           |
| G30 - Site Mechanical Utilities                             | \$153,090           | \$192,710           | \$345,800           |
| G40 - Site Electrical Utilities                             | \$420,000           | \$140,000           | \$560,000           |
| G60 - Other Site Construction                               | \$137,500           | \$0                 | \$137,500           |
| Design Contingency  | \$260,266           | \$192,470           | \$452,736           |
| Contractor Mark-Up  | \$93,696            | \$69,289            | \$162,985           |
| <b>Site Work Subtotal</b>                                   | <b>\$1,655,294</b>  | <b>\$1,224,107</b>  | <b>\$2,879,401</b>  |
| Full Building Demolition                                    | \$2,280,000         | \$0                 | \$2,280,000         |
| Shoring Existing Historic Façade                            | \$740,000           | \$0                 | \$740,000           |
| <b>Related Project Costs</b>                                | <b>\$3,020,000</b>  | <b>\$0</b>          | <b>\$3,020,000</b>  |

## 5.2 PROPOSED FUNDING

### 5.2.1 FUND SOURCES

The proposed project is expected to be funded through state General Obligation Bonds. Design funding is being requested as a first priority in the 2025-27 Capital Budget. Construction for the Phase 1 funding will be requested as part of the 2027-2029 capital budget and the Phase 2 funding will be requested in the 2029-2031 capital budget.

### 5.2.2 ALTERNATIVE FINANCE ASSUMPTIONS

The project does not plan to use any alternative finance options.

### 5.2.3 BIENIA BREAKDOWN

The preferred alternative funding for both Phases are shown below. Design funding for both Phase 1 and Phase 2 are requested in the 25-27 Biennium. This allows the complete project to be designed and permitted under the same code cycles and provides design and construction continuity. Construction for Phase 1 is requested in the 27-29 Biennium as is the portion of the consultant services dedicated to CA. Construction for Phase 2 will be requested in the 29-31 Biennium as well as the portion of consultant services dedicated to CA. Project Admin for EWU will be allocated across all three Biennia for continual project oversight.

| Escalated Project Costs                    | 23-25 Bienium    | 25-27 Bienium       | 27-29 Bienium       | 29-31 Bienium       |

5.3 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS

5.3.1 OPERATING BUDGET IMPACT

The proposed project is expected to increase the schools ongoing maintenance and operations costs. These costs have been estimated based on assumed occupancy in June 2029 for Phase 1 and June 2031 for Phase 2. Funding for the increase in operating cost will be requested within the overall state appropriated budget.

5.3.2 OPERATING COSTS

The following charts illustrate the projected maintenance and operations costs over the first six biennial of the building occupancy.

| M&O Expense               | 31-32 Bienium  |                | 33-34 Bienium  |                | 35-37 Bienium  |                |
|---------------------------|----------------|----------------|----------------|----------------|----------------|----------------|
|                           | 2031           | 2032           | 2033           | 2034           | 2035           | 2036           |
| Utilities                 | \$4.65         | \$4.78         | \$4.93         | \$5.08         | \$5.23         | \$5.39         |
| Building Maintenance      | \$3.25         | \$3.35         | \$3.45         | \$3.56         | \$3.66         | \$3.77         |
| Custodial & Grounds       | \$4.25         | \$4.38         | \$4.51         | \$4.65         | \$4.79         | \$4.93         |
| Ops & Mgmt Support        | \$4.45         | \$4.58         | \$4.72         | \$4.86         | \$5.01         | \$5.16         |

5.3.3 MAINTENANCE AND OPERATIONS RESPONSIBILITY

The university as the owner will be responsible for all ongoing maintenance and operations. The building renovation will result in increased maintenance costs for the campus, however energy costs will be significantly reduced. The renovated building will require an increase in custodial, maintenance, and technology staff.

| New Building Operating Costs | Change in FTE from current levels |
|------------------------------|-----------------------------------|
| Utilities                    | No change                         |
| Janitorial Services          | + .5 FTE                          |
| Grounds                      | No change                         |
| Security                     | No change                         |
| Maintenance and Repair       | + .25 FTE                         |
| Management                   | No change                         |
| Technology                   | + .25 FTE                         |
| <b>Total Increase in FTE</b> | <b>+ 1 FTE</b>                    |

5.4 FURNITURE, FIXTURES AND EQUIPMENT

The Budget for furniture, fixtures, and equipment has been included in the C-100 cost outline. This budget includes built-in items such as casework and equipment that will require coordinating with building systems and utilities. The budget also includes funds for information technology, telecommunication, and audio-visual equipment.

# SECTION 6

## APPENDICES

### 6.1 PREDESIGN CHECKLIST

- (c) Identify consultant services, DES resources or additional staff needed to manage the project.

L. Schedule

- vii. Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
- viii. Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110\(5\)\(c\)](#).
- ix. Describe factors that may delay the project schedule, such as an environmentally sensitive location, possible presence of archaeological or historical assets, or possible contamination of the site or buildings undergoing renovation.
- x. Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
- xi. Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are part of the process.

**Project budget analysis for the preferred alternative**

- A. Cost estimate. Provide the following:
  - i. Major assumptions used in preparing the cost estimate
  - ii. Summary table of Uniformat II Level 2 cost estimates
  - iii. The [C-100](#) in Excel
- B. Proposed funding
  - i. Identify the fund sources and expected receipt of the funds.
  - ii. If alternatively financed, such as through a Certificate of Participation (COP), provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates. For assistance, please contact [Brianna May, Office of the State Treasurer, 360-902-9022](#) or [email](#).
- C. Facility operations and maintenance requirements
  - i. Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - ii. Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repairs, replacement, and maintenance.
  - iii. Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- D. Furniture, fixtures, and equipment. Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

### 8.3 Appendices

#### Appendix 1: Predesign checklist and outline

A predesign should include the content detailed here. OFM will approve limited scope predesigns on a case-by-case basis.

#### **Executive summary**

Problem statement, opportunity, or program requirement

- Identify the problem, opportunity, or program requirement that the project addresses and how it will be accomplished.

- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location, or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals, and objectives; statutory requirements; and the problem, opportunity, or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

### **Analysis of alternatives (including the preferred alternative)**

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost [Model](#) (RCW [39.35B.050](#)).
    - Schedule estimates for each alternative. Estimate the start, midpoint, and completion dates.

### **Detailed analysis of preferred alternative**

- Nature of space – how much of the proposed space will be used for what purpose (i.e., office, lab, conference, classroom, etc.)
- Occupancy numbers.
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site analysis:
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floorplans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
  - Consistency with applicable long-term plans (such as the Thurston County and Capitol campus master plans and agency or area master plans) as required by RCW 43.88.110.

- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter [39.35D](#) RCW).
  - State efficiency and environmental performance, if applicable (Executive Order [20-01](#)).
  - State energy standards for clean buildings (RCW [19.27A.210](#)).
  - Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW [19.27.540](#)).
  - Greenhouse gas emissions reduction policy (RCW [70.235.070](#)).
  - Archeological and cultural resources (Executive Order [21-02](#) and [Section 106](#) of the National Historic Preservation Act of 1966). If mitigation is anticipated, please note this in the predesign with narrative about how mitigation is worked into the project schedule and budget.
  - Americans with Disabilities Act (ADA) implementation (Executive Order [96-04](#)).
  - Compliance with planning under Chapter [36.70A](#) RCW, as required by RCW [43.88.0301](#).
  - Information required by RCW [43.88.0301](#)(1).
  - Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project, including impacts to current lease contracts. Include detail on the need to backfill space or cost assumptions for vacant space.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative. The proposed method of project delivery must be justified.
- Describe how the project will be managed within the agency.
- Schedule.
  - Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
  - Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110\(5\)\(c\)](#).
  - Describe factors that may delay the project schedule.
  - Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
  - Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

## Project budget analysis for the preferred alternative

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The [C-100](#).
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
  - If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement, and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

## Pre-design appendices

- Completed Life Cycle Cost [Model](#).
- A letter from DAHP.
- Title report for projects including proposed acquisition.

## Appendix 2: Glossary

**Acquisition.** This type of project includes the acquisition of land, structures, and buildings. These are fixed assets that have no relationship to the addition or improvement to, or the repair or replacement of, existing fixed assets. Examples of an acquisition are the purchase of a tract of land or a building.

**Alternate financing.** Proposals that cover a wide range of financial contracts that call for the development or use of space by state agencies through a contractual arrangement with a developer or financing entity. Financing may involve the sale of debt obligations (certificates of participation, or COPs, through the State Treasurer) or funding from a private developer. Title to the property involved may transfer to the state either upon exercise of an option or at the termination of the contract.

**Constructability review.** A review by an independent consultant or contractor to determine if a project can be physically built as designed. This is to reduce construction change orders and claims. Conduct this review at 75–95 percent completion of the construction documents.

**Consultant.** A person or entity who provides advice or services to an agency/institution.

**Contractor.** A person, firm, or corporation who, in the pursuit of an independent business, undertakes or submits a bid to construct, alter, repair, add to, subtract from, improve, move, or

#### COMMENTS:

Design, Bid, Build delivery method is assumed

Assumes a Q3, 2027 start and a 40 month schedule

Escalation is predicted to be 4% in 2024 and 4% through 2027.

Estimate excludes soft costs such as design fees, permits, testing / inspections, construction change order contingencies, loose fixtures / furnishings and sales tax.

**What is planned for the requested new appropriation? (Ex. Acquisition and design, phase 1 construction, etc. )**

Full Building Design Services (Phase 1 and Phase 2 Consultant Services)

(Note: Phase 2 design services is included in Phase 2 -C100)

**What has been completed or is underway with a previous appropriation?**

Pre-design Services were retained in 2023-2025 Biennium

**What is planned with a future appropriation?**

2027-2029 Phase 1 Construction/Closeout Services

2029-2031 Phase 2 Construction - (See Phase 2 - C100)

**INTRODUCTION**

**AUTHORITY:**

This predesign study was authorized by and contracted through Eastern Washington University.

**FORMAT:**

This document has prepared by utilizing the format recommended in the 2025-2027 Pre-Design Manual developed by the Office of Financial Management, State of Washington.

**PRE-DESIGN COMMITTEE MEMBERS:**

**Eastern Washington University**

- Paul Weed, Director - Planning & Budget, Academic Affairs
- Erik Budsberg, Director of Sustainability
- Shawn King, Associate Vice President, Facilities & Planning
- Kris Jeske, Director of Construction & Planning
- Lance Potter, Phd. - Chair, Associate Professor, School of Education
- Tara Haskins, Ph.D - Literacy Professor, School of Education
- Annette Clark - Administrative Assistant, School of Education
- Dr. Kayleen Islam-Zwart, Ph.D - Chair & Director, School of Psychology
- Dr. Nick Jackson, Ph.D - Professor, School of Psychology
- Tricia Hughes - Senior Director, EWU Student Affairs, Counseling & Wellness
- Carla Benson - Client Services Supervisor, EWU Student Affairs, Counseling & Wellness Services
- Brock Sieb - Interim Director, Student Accommodations & Support Services
- Michelle Helmerick - Interim Associate Director, Student Accommodations & Support Services

**Design Team**

- Becky Barnhart, Integrus
- Kandis Larsen, Integrus
- Ty Miller, Integrus
- Kayla Stoker, Integrus
- Robert Graper, Integrus - Structural
- Anthony Schoen, MW Engineers
- Joel Enevold, MW Engineers
- Ken Wiersma, Coughlin Porter Lundeen

*Martin Williamson Hall - Project Site*

# SECTION 1

## EXECUTIVE SUMMARY

## 1.0 EXECUTIVE SUMMARY

### 1.1 PROBLEM SUMMARY

Martin Williamson Hall stands as one of Eastern Washington University's largest academic buildings, encompassing approximately 90,000 gross square feet. Positioned prominently near the main campus quad, Martin Williamson creates an iconic historic backdrop for the pedestrian heart of campus life.

Martin Williamson Hall houses two of five programs within the College of Professional Programs: the School of Education and the School of Psychology. Also located within Martin Williamson Hall, and closely tied to the departments and academic success is Counseling and Wellness Services.

The current condition and configuration of Martin Williamson Hall presents significant obstacles and limitations to the departments housed within, inhibiting effective quality program instruction, administration, and student services. Addressing these challenges is paramount to fostering an environment conducive to student and departmental success at EWU.

Eastern Washington University is working to reduce its Energy Use Intensity (EUI) to meet Clean Building Performance Standard requirements and aims to switch from fossil fuel-based heating to alternative energy sources.

### 1.2 OPPORTUNITY AND PROGRAM REQUIREMENTS

Currently, Martin Williamson Hall houses the School of Education, School of Psychology, and Mental Health Counseling Services, but the building lacks sufficient space and amenities to support these programs effectively. There are issues with accessibility, safety, and outdated infrastructure, which impact the learning environment and research capabilities. Additionally, these shortcomings contribute to high energy usage and carbon emissions.

The proposed project is envisioned as a 124,000 gsf multi-story and multi-use facility to house the School of Education, School of Psychology, Counseling and Wellness Services, and Student Accommodations and Support Services.

*Martin Hall Entry*

*Martin Williamson Hall Connection & Williamson Entry*

*Martin Williamson Hall Connection*

EWU currently houses the critical student support services of Mental Health Counseling Services, Wellness Services, and Student Accommodations and Support Services spread across three different buildings on campus. Consolidating the three services of Mental Health Counseling, Wellness, and Student Accommodations into a single building at the campus core will improve access and offer streamlined and holistic wrap-around support to EWU students.

Mental Health Counseling services are presently housed in Martin Hall, where the counseling offices and treatment rooms are outdated and inadequate. These spaces lack sufficient size and amenities to accommodate the full range of services provided. Moreover, they suffer from accessibility shortcomings and fail to uphold the necessary standards for patient confidentiality.

Wellness Services currently reside within the University Recreation Center and lacks a dedicated space for its Peer Health Educators and Eagles for Recovery program. With Counseling and Wellness housed in separate buildings, it not only hinders collaboration and wrap-around student support, but challenges the Director to provide timely oversight and immediate assistance to both initiatives.

Student Accommodations and Support Services currently occupies two segmented areas in the basement level of Hargreaves Hall. This space poses challenges for individuals with mobility or vision impairments due to its remote location within the building requiring the use of ramps and elevators. Furthermore, the case manager offices located in a separate suite creates obstacles for directors to efficiently oversee activities and provide assistance when required.

The COVID-19 pandemic produced psychological hardship across the world and has created new social and academic challenges for today's youth. The World Health Organization says, "COVID-19 pandemic triggers 25% increase in prevalence of anxiety and depression worldwide in its first year;" "By the end of 2021 the situation had somewhat improved but today too many people remain unable to get the care and support they need for both pre-existing and newly developed mental health conditions."

**This project will allow Eastern Washington University's Counseling and Wellness Services, Training Clinic, and Student Accommodations and Support Services to be conveniently collocated at the center of campus, where they will be able to provide high quality services to students, faculty, staff, and the broader community for free and in private spaces designed for confidentiality and comfort.**

This project will result in a new functional facility that addresses modern instruction and research needs and provides a sensitive and supportive environment for all EWU students. The facility will have an expected life of 50-100 years, and will significantly increase energy efficiency, with a high-performance envelope, and all new low carbon energy efficient designs and equipment. It will be designed to a minimum LEED Silver certification by the U.S. Green Building Council and to meet the Washington State Clean Building Standards.

An energy life cycle cost analysis was conducted to explore potential energy systems for the building. This assessment revealed an energy use reduction from the existing building, which could lower the overall campus EUI by over 6%, bringing it within the Clean Building Performance Standard requirements. With these high-performing energy systems and a connection to the newly proposed all-electric geothermal heating system, this building will become one of the first all-electric buildings on campus, significantly reducing the campus' operational carbon emissions.

### 1.3 SUMMARY OF ALTERNATIVES

The Martin Williamson Hall Predesign considered three alternatives summarized below.

#### **Alternative A: No Action**

A no action alternative was considered.

#### **Alternative B: Renovation & Replacement**

Alternative B explored the full renovation of Martin Hall and the complete replacement of Williamson Hall.

#### **Alternative C: Historic Screen (Preferred Alternative)**

Alternative C presents a comprehensive plan centered on the replacement of Martin Williamson Hall while preserving two of Martin Hall's historic facades—the northeast and southeast elevations.

### 1.4 SUMMARY OF PREFERRED ALTERNATIVE

The identified institutional goals, program needs, and ability to address state mandated performance criteria can be best addressed through Alternative C: Historic Screen. This approach aligns most closely with EWU's institutional mission and overarching goals, while effectively addressing the project's Guiding Principles, and meeting the diverse needs of academic and student service programs to be housed in the facility.

*Alternative A Axon - No Action*

*Alternative B Axon - Renovation & Replacement*

*Alternative C Axon - Historic Screen*

1.5 SUMMARY BUDGET OF PREFERRED ALTERNATIVE

| Summary Budget of Preferred Alternative |                            |                            |                      |                              |                              |                           |
|---|----------------------------|----------------------------|----------------------|------------------------------|------------------------------|---------------------------|
|   | Phase 1 -<br>Cost Estimate | Phase 2 -<br>Cost Estimate | Total Cost           | Phase 1 -<br>Escalated Costs | Phase 2 -<br>Escalated Costs | Total Cost -<br>Escalated |
| Acquisition                             | \$0                        | \$0                        | \$0                  | \$0                          | \$0                          | \$0                       |
| Consultants                             | \$8,056,326                | \$5,466,907                | \$13,523,233         | \$8,789,190                  | \$6,117,967                  | \$14,907,157              |
| Construction                            | \$64,423,332               | \$44,402,726               | \$108,826,058        | \$73,112,861                 | \$53,879,081                 | \$126,991,942             |
| Equipment                               | \$3,308,181                | \$2,448,205                | \$5,756,386          | \$3,762,394                  | \$2,973,101                  | \$6,735,495               |
| Artwork                                 | \$441,683                  | \$325,913                  | \$767,596            | \$441,685                    | \$325,913                    | \$767,598                 |
| Project Admin                           | \$2,349,834                | \$1,821,884                | \$4,171,718          | \$2,672,466                  | \$2,212,496                  | \$4,884,962               |
| Other Costs                             | \$0                        | \$0                        | \$0                  | \$0                          | \$0                          | \$0                       |
| <b>Total Project</b>                    | <b>\$78,579,356</b>        | <b>\$54,465,635</b>        | <b>\$133,044,991</b> | <b>\$88,778,596</b>          | <b>\$65,508,558</b>          | <b>\$154,287,154</b>      |

# SECTION 2

## PROBLEM STATEMENT

## 2.0 PROBLEM STATEMENT

### 2.1 IDENTIFY THE PROBLEM & OPPORTUNITIES

#### Problem

EWU seeks design funding to renovate and re-imagine Martin Williamson Hall. Constructed in 1935 and later renovated in 1977, Martin Hall's evolution reflects the changing landscape of academic pedagogy. While the renovation in '77 introduced specialized laboratory and research clinical spaces, aligned with teaching methodologies of the time, these configurations now pose barriers to modern instructional practices. In contrast, Williamson Hall, erected in 1967, awaits comprehensive renovation and crucial infrastructure upgrades, with its systems exceeding their anticipated lifespans.

The current condition and configuration of Martin Williamson Hall presents significant obstacles and limitations to the departments housed within, inhibiting effective quality program instruction, administration, and student services. Addressing these challenges is paramount to fostering an environment conducive to student and departmental success at EWU.

#### Opportunities

This project offers opportunities to tackle current programmatic, safety, equity, sustainability, and operational challenges facing Martin Williamson Hall. Through strategic initiatives, EWU aims to profoundly enhance the experiences of students, faculty, and staff within the School of Education, School of Psychology, Counseling and Wellness Services, Student Accommodations and Support Services, and the wider EWU community. The renovation of Martin Williamson Hall encompasses several key opportunities:

- **Quality Learning Outcomes:**

Transforming underutilized and inadequate instructional spaces into new, accessible, and supportive learning environments tailored to meet the diverse needs of the student body. This alternative proposes a reduction in classrooms from 27 to 15, which improves EWU's total campus classroom utilization.

- **High-Performance and Decarbonization:**

Implementing state-of-the-art, energy-efficient building systems to minimize energy consumption and reduce the need for ongoing maintenance. These upgrades not only benefit the environment but also ensure the long-term functionality of the facility.

Eastern Washington University is actively seeking strategies to reduce its campus Energy Use Intensity (EUI) to meet the Clean Building Performance Standard requirements, as the current EUI exceeds these standards. Additionally, the university aims to utilize alternative heating sources that do not rely on fossil fuels, compared to their existing fossil fuel-driven campus steam plant.

- **Inclusive and Equitable Environments:**

By housing C&WS and SASS within the building, implementing universal design principles will enhance the capacity of these programs to support all EWU students effectively and equitably. The inclusion of Inclusive Restrooms, designed to accommodate students of all identities, abilities, and backgrounds, will set a precedent for future models across the EWU campus.

- **Safety and Access:**

Enhancing accessibility and safety measures by ensuring all building entries are accessible, eliminating long dead-end corridors to improve emergency response, addressing accessibility deficiencies, and enhancing wayfinding and navigational features.

Auditorium

## 2.2 DRIVERS FOR THE PROJECT'S OPERATIONAL PROGRAMS

The existing Martin Williamson Hall is currently in non-compliance or below standard requirements of the following local, state, and federal codes:

### Accessibility Requirements for People with Disabilities:

- Washington State Law Against Discrimination (RCW49.60.222)
- Washington State Building Code (WAC 52-50)
- Americans with Disabilities Act of 1990 (2 U.S.C. Part B)
- Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794)

### Green Building Requirements:

- High Performance Building – LEED Silver Standard (RCW 39.35D)
- State Energy Standards for Clean Buildings, RCW 19.27A.210
- Per Executive Order 20-01 State Efficiency and Environmental Performance, New Facility Construction, dated January 23, 2020.
- Electric Car Charging Stations per RCW 19.27.540
- Greenhouse Gas Reduction Strategies per RCW 70A.45.070

### Infrastructure Requirements:

- International Building Code (IBC)
- International Mechanical Code
- International Fire Code (IFC)
- Local Codes & Ordinances
- National Electric Code (NFPA 70)

### Fire Protection Requirements:

- National Fire Protection Association (NFPA) Section 13
- International Fire Code (IFC)
- Regulations of the State Fire Marshall

Pedagogy, research, and technology requirements significantly differ from those of fifty years ago when the buildings were constructed and renovated. Current techniques often include more project-based work which demands group participation in a large room setup with multiple teaching and learning aids. These typically square spaces don't fit well in the old building with short spans and small column bays. The few larger classrooms in the existing building have limited technology infrastructure and difficult site lines for students sitting at the room's periphery.

Existing Mental Health Counseling Services Entrance

Existing Student Space

2.3 CONNECTION TO AGENCY MISSION, GOALS AND OBJECTIVES

The Guiding Principles and preferred alternative for this project align with Eastern Washington University’s institutional goals at several levels and across several of their different campus plans and initiatives.

Guiding Principles

The proposed renovation of Martin Williamson Hall supports Eastern Washington University’s commitment to expanding opportunities for personal transformation through excellence in learning through three core themes of access, learning, and completion. The Martin Williamson Hall renovation embodies each of these requirements by centering key wellness functions and departments that are feeders to our regional wellness and education systems into a single multidisciplinary and highly functional building.

An initial visioning workshop was held with the Pre-design Committee to develop a list of goals and aspirations that would guide the project. The identified goals were all centered around three themes: CONNECTIVE, SUPPORTIVE, and FUTURE FORWARD. The below Guiding Principles will be referenced throughout the design process and aid in project decision making.

CONNECTIVE

- Articulate spaces that are **WELCOMING** to all and foster **CONNECTION**.
- Encourage a **COLLABORATIVE ENVIRONMENT** for student, faculty, and departmental interactions.

SUPPORTIVE

- Create environments that are **SENSITIVE** and meet needs beyond that which is basic and required.
- Provide students and faculty with a modern space for **RESEARCH** and **APPLIED WORK** so they hone skills to **SERVE** their communities.

FUTURE FORWARD

- Build for **LONGEVITY** of infrastructure and program **ADAPTABILITY**, always considering the building’s **NEXT LIFE**.
- Reduce environmental impact through **DECARBONIZATION** and improved **EFFICIENCY**.

**Alignment to EWU Institutional Strategic Plan**

The mission of Eastern Washington University is to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence. The renovation of Martin Williamson Hall will support EWU’s 2024-2029 Institutional Strategic Plan (in the process of being finalized and adopted by the board of trustees) through:

**ACCESSIBILITY:**

Martin Williamson Hall will convert an outdated building, no longer compliant with current codes for accessibility and safety, by improving access and inclusivity throughout to reflect the vibrant, welcoming, and supportive environment they strive to create.

**ACADEMIC EXCELLENCE:**

Martin Williamson Hall will transform the learning experience of EWU students creating a learning environment that is a hub of hands-on learning, collaboration, and support.

**BELONGING:**

Martin Williamson Hall will elevate and improve access for all EWU students to Counseling and Wellness Services and Student Accommodations and Support Services by collocating these critical support programs in a central and convenient location.

**REGIONAL IMPACT:**

Martin Williamson Hall will promote collaboration across the Education and Psychology departments and be a conduit for interaction between faculty, students, and administrators leading to new and unrealized opportunities to support the region.

**STUDENT SUCCESS:**

Martin Williamson Hall will be transformed into a student-centered hub for learning and support services. Modern functional learning environments will inspire students and ensure that success is not only measured or achieved through academics but a wholistic student experience.

**SUSTAINABILITY:**

Martin Williamson Hall will have high-performing energy systems and a connection to the newly proposed all-electric geothermal heating system and will become one of the first all-electric buildings on campus.

*Primary Campus Pathway - Martin Hall*

*Arevalo Student Mall Near Martin Williamson*

*Secondary Campus Pathway - Williamson Hall*

**Alignment with EWU Campus Master Plan**

Eastern Washington University plans to revisit the Campus Master Plan starting summer of 2024 and the renovation of Martin Williamson Hall will remain a critical component of their future planning.

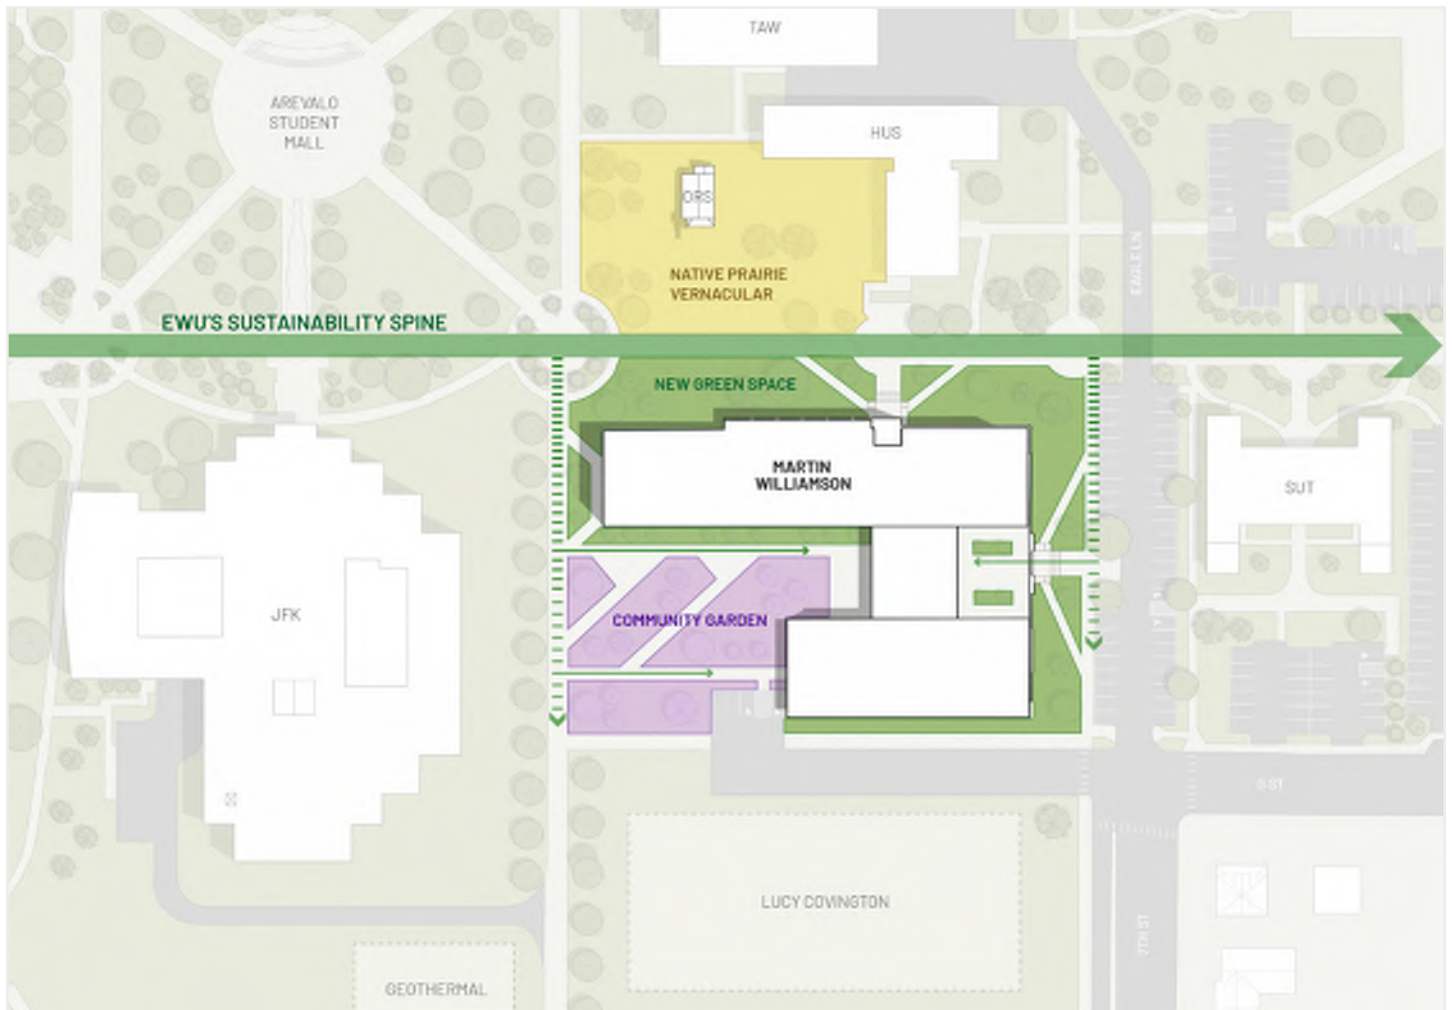

**Alignment with EWU Climate Action Plan**

The major renovation of Martin Williamson Hall is one of the top building priorities identified in EWU’s 2022-2025 Climate Action Plan to support targeted reductions in campus energy use and greenhouse gas emissions.

By connecting this building to the newly proposed, ultra-high efficient geothermal heating and cooling system, it will become one of the first on campus to enable energy trading with existing buildings. This setup will allow the capture and utilization of previously wasted energy.

**Alignment with EWU Climate Resiliency Landscape Master Plan**

EWU’s Climate Resiliency Landscape Master Plan establishes a ‘Sustainability Spine’ that seamlessly integrates sustainable landscaping into the heart of the campus. This initiative aims to showcase EWU’s commitment to sustainability and climate resilience, providing students with daily exposure to these essential concepts. The ‘Sustainability Spine’ will span the entirety of Martin Williamson Hall’s northeast facade, with extensions reaching along its northwest and southeast facades. The preferred Alternative C: Historic Screen intends to incorporate elements of the ‘Sustainability Spine’ into its landscape design.

*Alignment with EWU Climate Resiliency Landscape Master Plan*

## 2.4 SUMMARY OF NEEDS TO SOLVE THE PROBLEM

There are three key components necessary to solve this problem.

1. To best support EWU students with mental health, wellness, and accommodation services, the critical student affairs services such as Counseling and Wellness Services and Student Accommodations and Support Services should be consolidated and collocated at the campus core.
2. To provide quality learning outcomes and grow the region’s pool of educators and mental health professionals the School of Education and School of Psychology need modern pedagogically appropriate instructional labs, research space, and classrooms to support learning and innovation.
3. To support EWU’s decarbonization plan, reduce operational costs, and meet the campus EUI requirements of the Clean Building Performance Standard, this project necessitates the connection to a new all-electric heating system. This newly proposed all-electric ground source heating and cooling system, known as the Geo Eco Plant, will serve as a standalone heating and cooling central utility plant. The Geo Eco Plant will provide energy to multiple buildings on campus, including this project, enabling energy trading between connected buildings and utilizing previously wasted energy. The Geo Eco Plant will also serve as an instructional tool for the campus and local community, showcasing forward-thinking methods for providing heating and cooling to the campus using renewable energy sources.

## 2.5 PROJECT HISTORY

Martin Hall was constructed in 1935 to house the campus elementary training school. Williamson Hall was constructed in 1967 to house the growing School of Education. Martin Hall underwent an intensive interior renovation in 1980 to create specialized lab spaces for the School of Psychology. Williamson Hall has never been fully renovated.

# SECTION 3

PROGRAM ANALYSIS

## 3.0 ANALYSIS OF ALTERNATIVES

### 3.1 ALTERNATIVES CONSIDERED:

The following offers additional descriptions of the three alternatives considered for this project

#### 3.1.1 ALTERNATIVE A: NO ACTION

A No Action alternative was considered but would involve a number of limitations and negative outcomes for EWU students, faculty, and the broader regional community.

#### Advantages:

- There are no advantages to a No Action alternative.

#### Disadvantages:

- Inability to offer quality instruction and learning outcomes for Departments of Education and Psychology.
- Limits ability to grow the Education and Psychology programs and in turn the regional pool of educators and trained mental health professionals.
- Further degradation of a historic structure at the heart of EWU's campus.
- High maintenance and operational costs due to outdated and low performing infrastructure.
- The existing inefficient layout with a 54% efficiency factor remains and contributes to wayfinding and safety issues with many internal halls and corridors.

Existing Martin-Williamson

#### KEY

- Demolished Space
- New Space
- Existing Space

### 3.1.2 ALTERNATIVE B: RENOVATION & REPLACEMENT

The Renovation and Replacement alternative suggests a substantial renovation of Martin Hall, including 58,700 sf, along with the replacement of Williamson Hall with a 74,300 sf addition, resulting in a total area of 133,300 sf. The current limitations of the building's size and structural systems make it impossible to accommodate adequately sized and accessible classrooms, necessitating a significant expansion. The existing building's layout and condition are obsolete and require full replacement. Additionally, existing conditions do not support modern teaching methods, inclusivity, or student well-being. Given these considerations, a comprehensive renovation of the existing building and the addition is necessary.

#### Advantages:

- Retains the historic character of Martin Hall.
- Retains a portion of the embodied carbon of Martin Hall's concrete structure.
- Can redefine the sense of welcome and building character that faces the campus mall.

#### Disadvantages:

- Requires the demolition and replacement of Williamson Hall.
- Results in minimal long-term adaptability in renovated Martin Hall due to size and spacing of structural system.
- Requires about 9,000 gross square feet more to accommodate the baseline assignable program spaces due to structural grid inefficiencies.
- Larger classroom spaces would be in the new addition retaining limitations to the configuration of spaces in Martin Hall.
- Student support services, such as Counseling and Wellness Services and Student Accommodations and Support Services, remaining in Martin Hall will be either segmented or spread inefficiently along narrow portions of the building due to structural limitations.
- Maintains a mostly enclosed building courtyard with limited visibility and access by the greater EWU campus.
- Segmented and choppy program organization.
- Results in reduced operational efficiency at the renovated portion of the building due to limited envelope improvements, low floor-to-floor height, and inefficient program layout.

#### Demolished Area Shown in Green

#### New Space Shown in Blue

#### KEY

- Demolished Space
- New Space
- Existing Space

### 3.1.3 ALTERNATIVE C: HISTORIC SCREEN (PREFERRED ALTERNATIVE)

The Historic Screen alternative suggests preserving two of Martin Hall's historic facades and replacing much of the structure with an adaptable and efficient 124,000 sf building beyond.

#### Advantages:

- Retains the historic character of Martin Hall's signature facades.
- Redefine the sense of welcoming and character that faces the campus mall.
- Implements a new structural system that supports long-term adaptability of the building.
- Results in a more cohesive program organization to improve access, wayfinding, and circulation.
- Student support services, such as Counseling and Wellness Services and Student Accommodations and Support Services, can be collocated in an area of the building that supports student access and functionality within the suite.
- Defines outdoor spaces that improve access and use, engage the surrounding campus, and reduce safety and security concerns.
- Results in better operational performance due to a primarily new envelope and more efficient plan and program organization.

#### Disadvantages:

- Requires the demolition of the majority of Martin Williamson Hall.
- Lost embodied carbon in the demolition of the existing structural systems and building envelope.
- Requires temporary support to preserve the historic facades during construction and demolition.

#### New Space Shown in Blue

#### KEY

- Demolished Space
- New Space
- Existing Space

3.1.4 PREFERRED ALTERNATIVE & WHY

Alternative C: Historic Screen has been designated as the preferred option by the Pre-design Committee. This approach aligns most closely with EWU’s institutional strategic goals, while effectively addressing the project Guiding Principles and meeting the diverse needs of the academic and student service programs.

The matrix provided below served as a valuable tool for the Pre-design Committee, facilitating interactive discussions and comparative analysis of the alternatives against the established Guiding Principles and other pertinent factors. Notably, Alternative C: Historic Screen emerged as the standout choice across most categories, affirming its status as the preferred alternative for the project.

3.2 COST ESTIMATE FOR EACH ALTERNATIVE

3.2.1 ESTIMATE OVERVIEW

Cost Estimates were performed for each of the two new construction options. All of the options used the same general assumptions including the delivery type, construction materials, and building systems. The estimates also used the same program areas and assignable square footages. The differences in cost reflect the variations in overall building efficiency and the different amounts of building envelope required by each layout option.

|                                 | Ownership Option 1 | Ownership Option 2 | Preferred Option<br>Ownership Option 3 |
|---------------------------------|--------------------|--------------------|--|
|                                 | No action          | Reno & Replace     | Historic Screen                        |
| ASF                             | 49,275             | 87,062             | 87,062                                 |
| GSF                             | 91,500             | 133,000            | 124,375                                |
| Efficiency                      | 54%                | 65%                | 70%                                    |
| Construction MACC               | 0                  | 83,938,751         | 90,603,907                             |
| <b>Unescalated Project Cost</b> | <b>0</b>           | <b>122,605,913</b> | <b>133,044,991</b>                     |

3.2.2 LCCM

Each of the construction alternatives were analyzed using the Office of Financial Management (OFM) Life Cycle Cost Model (LCCM). The No Action alternative was not studied as it will not meet the university’s needs as outlined above. As part of the analysis, energy modeling was performed to understand the energy efficiency of each layout along with the programmatic efficiency.

|                                | Ownership Option 1 | Ownership Option 2 | Preferred Option<br>Ownership Option 3 |
|--------------------------------|--------------------|--------------------|--|
|                                | No action          | Reno & Replace     | Historic Screen                        |
| Construction MACC              | \$0                | \$83,938,751       | \$90,603,907                           |
| Unescalated Total Project Cost | \$0                | \$122,605,913      | \$133,044,991                          |
| Annual Energy Cost             | \$79,605           | \$89,110           | \$58,456                               |
| 30 Year Net Present Value      | \$105,789,331      | \$201,722,945      | \$210,065,797                          |
| 50 Year Net Present Value      | \$168,770,287      | \$291,065,004      | \$294,931,694                          |
| <b>LCCM Ranking</b>            | <b>1</b>           | <b>2</b>           | <b>3</b>                               |

3.3 SCHEDULE ESTIMATE

Alternates B and C would have the same anticipated project schedule as outlined below. A full milestone schedule is included in Section 4.

| Project Phase                     | Date of Completion |
|-----------------------------------|--------------------|
| Predesign                         | June-24            |
| Schematic Design                  | April-26           |
| Design Development                | November-26        |
| Construction Documents            | June-27            |
| Phase 1 - Bid/ Award/ Contracting | July-27            |
| Phase 1 - Construction Start      | August-27          |
| Phase 1 - Construction Mid Point  | June-28            |
| Phase 1 - Substantial Completion  | May-29             |
| Phase 1 - Final Completion        | June-29            |
| Phase 2 - Bid/ Award/ Contracting | July-29            |
| Phase 2 - Construction Start      | August-29          |
| Phase 2 - Construction Mid Point  | June-30            |
| Phase 2 - Substantial Completion  | May-31             |
| Phase 2 - Final Completion        | June-31            |

# SECTION 4

DETAILED ANALYSIS OF  
PREFERRED ALTERNATIVE

## 4.0 DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

### 4.1 DESCRIPTION OF PREFERRED ALTERNATIVE

The following offers a detailed analysis of the preferred alternative regarding nature of space, occupancy numbers, basic configuration, and space needs.

#### 4.1.1 NATURE OF SPACE

Martin Williamson Hall will support four distinct entities for EWU, including two academic departments and two student support services programs. The entities to be housed in the building are the School of Education, School of Psychology, Counseling and Wellness Services, and Student Accommodations and Support Services. To support these four separate entities, the building will require a diverse array of counseling, assessment, instructional, research, administrative, office, storage, and student space.

##### School of Education

The School of Education prepares student-centered educators to be professionals, leaders, scholars, and practitioners to support the rural communities of the region.

- Center for Rural Education Effectiveness - NEW: EWU is in the planning stage of becoming a rural education hub which includes devoted space for education and technology to reach remote districts. (Aligns with RCW 28B.10.033.1.b.i)
- Continuing Education Programs: To maintain certification, educators are required to complete continuing education credits throughout their career. EWU offers Professional and Continuing Education opportunities for either professional development or personal enrichment through clock hours, professional certifications, and continuing education units.
- Field Experience: Coordinates school-based field experiences and full-time student teaching internship placements for all teacher candidates in the EWU School of Education.

To attract teaching candidates in these high-need areas, EWU must fulfill the Professional Educators Standards Board Domain 7, which states that “Providers ensure that programs have adequate resources, facilities, and governance structures to enable effective administration and fiscal sustainability.” Specifically, 7.3 addresses three components of adequate facilities which include having necessary classrooms, lab and office spaces, and current technology.

##### School of Psychology

The School of Psychology offers programs that are critical and necessary for the region, serving to address shortages in mental health and school service provision, and providing important applied research. EWU’s graduate and undergraduate programs directly support and provide a pipeline to support these three regional areas of need. In addition to academic offerings, existing and emerging curricular initiatives include the following:

- Autism Drop-In Center: Resource for students identified with autism spectrum disorder.
- Training Clinic - NEW: Providing effective and affordable mental health services to the community and a site to train doctoral students in clinical psychology programs.
- Assessment Program: To support the evaluation, identification, and documentation needs of students with suspected learning disabilities, neurocognitive disorders, and ADHD.
- Sports Psychology Services

Currently Martin Williamson Hall is a barrier to effective education and learning for the School of Education and School of Psychology. Reconfigured spaces equipped with modern infrastructure systems and technology will make it possible for the programs to not only attract more students but offer improved learning outcomes and ultimately better educational outcomes to support regional needs in educators and mental health professionals.

## Counseling & Wellness Services

Counseling & Wellness Services provides EWU students with an array of initiatives that support their mental, emotional, and physical wellbeing. Below is a condensed list of some of the existing and emerging offerings:

- **Eagles for Recovery:** A collegiate program for EWU students who are in recovery, thinking about recovery, and those who want to participate as recovery allies. The program provides support and help navigating recovery while being a student at EWU.
- **“Let’s Talk” Events - NEW:** Counselors meet students where they are to offer no barrier consultations. Two that are a high priority for the counseling center include the Veteran’s Resource Center and CAMP (College Assistance Migrant Program) which serve students that underutilize counseling services.
- **H.E.A.R.T Workshops (Healing, Encouraging, and Rising Together) - NEW:** A workshop series tailored for students of color who are looking for a supportive, inclusive, and safe space to discuss daily stressors and lived experiences.
- **Food Pantry:** This year the Food Pantry has seen an 8% increase, serving 615 students each month.
- **TREE (Trauma Recovery Education at Eastern):** Provides planned university response for unexpected tragic events that gives structure, information, and a space to acknowledge what happened. Offering students, faculty, and staff a resource to turn to when they are feeling overwhelmed after an event.
- **Basic Needs Office Hours & Resource Center**
- **Mental Health First Aid Courses**
- **Sexual Health Education and Disease Prevention & Resources**

Over the course of the 2022-2023 regular academic year, the Counseling office had 2,134 attended appointments, which averages 711 appointments each quarter that does not include no-shows or canceled appointments. Thus far in 2024, counselors have helped 115 students assessed as being at academic risk, have held 113 outreach events, and have held appointments with 77 clients assessed as having some level of suicidal risk.

Example of C&WS Campus Outreach Events

**According to the American Foundation of Suicide Prevention suicide is the second leading cause of death for ages 10-24 in Washington state. According to federal guidelines 83% of communities in Washington did not have enough mental health providers to serve residents in 2023. These are staggering statistics that demonstrate how crucial it is to improve access to mental health services for students enrolled in postsecondary institutions.**

### Student Accommodations & Support Services

Student Accommodations & Support Services is a combination of the Student Care Team and Disability Support Services that serves students who may be struggling with personal challenges and/or obstacles.

- Student Emergency Fund (SEF): Provides limited, one-time, financial assistance to students unable to meet immediate, essential expenses because of temporary emergencies.
- Passport to Careers Program: Helps former foster youth and unaccompanied homeless youth succeed in college by connecting them to resources, peer mentoring, study space, peer counseling, assistance with FAFSA, communication with faculty, transitioning to the college environment, and support while living on campus.
- Assistive and Adaptive Technology
- Proctored Testing Accommodations
- Medical Accommodations
- Religious Accommodations

Over the last 5 years, SASS has averaged a 147% increase in cases per year. In the 2022-2023 academic year, Support Services managed 1205 cases requiring wrap-around care and proctored 250 exams. Accommodations staff averages serving 750 students per term. In the last year, the Passport to Careers Program has increased enrollment by 150%.

In the 2022-2023 academic year, Washington State legislature made significant investment in student success initiatives at EWU to help ensure that students achieve degree completion. Over the last several years EWU has implemented a total intake model for academic advising and developed a coordinated care network that is designed to:

1. Maximize collaboration of various student support services.
2. Create wraparound care that helps students navigate and overcome social, financial, and/or health obstacles that delay or prevent the successful completion of their degree.
3. Provide holistic care that helps meet the challenge of increasing mental health concerns on college campuses.

Existing SASS Waiting Room

Existing SASS Testing Room

Existing SASS Meeting Space

Currently student support services are spread across multiple buildings on campus and in locations with low visibility and lacking direct access. Collocating Counseling and Wellness Services and Student Accommodations and Support Services will improve collaboration of the various student support services and create a central and convenient location for students to get wrap-around support.

**4.1.2 OCCUPANCY NUMBERS**

Martin Williamson Hall will be the primary building for two of five programs in the College of Professional Programs: the School of Education and the School of Psychology. The building will supports all students, faculty, and staff in the School of Education and School of Psychology through use of its instructional labs, classrooms, student spaces, offices, administratives spaces, and more.

Martin Williamson Hall will also house two of EWU’s largest student services programs. Counseling and Wellness Services currently averages 711 appointments each quarter, a number that continues to increase each year. Student Accomodations and Support Services managed 1205 cases last year, proctored 250 exams, and assists an average of 750 students with accomodations each term - all numbers anticipacted to continue increasing.

**4.1.3 PROGRAM SPACE NEEDS**

The building gross square footage is 124,375 gross square feet with a net assignable area of 87,062 square feet. The following is a breakdown of the assignable building areas: The program space list on the following pages contains a comprehensive breakdown of each space and its associated square footage. The quantities, areas, and supporting information therein were developed through a collaborative process including representatives from the departments and programs to be housed in the building and campus leadership in sustainability, planning, academics, and finance.

| Department                                   | Proposed SF    |
|--|----------------|
| 1.0 Psychology                               | 13,305         |
| 2.0 Education                                | 12,300         |
| 3.0 Counseling & Wellness Services           | 8,515          |
| 4.0 Student Accomodations & Support Services | 4,860          |
| 5.0 Shared                                   | 33,825         |
| 6.0 Building Operations                      | 14,257         |

4.1.4 BUILDING CONFIGURATION

Martin Williamson Hall is conceived as a thoughtful and intensive renovation project, carefully integrating new elements while preserving the historic character of the northeast and southeast facades from its 1935 origins. Behind this historic screen, the project will introduce three new components: two bars and a central hub. These additions, designed as three-story structures using a combination of steel and mass timber, are strategically planned to meet the project’s functional requirements and aspirational goals while celebrating a piece of EWU’s campus architectural heritage.

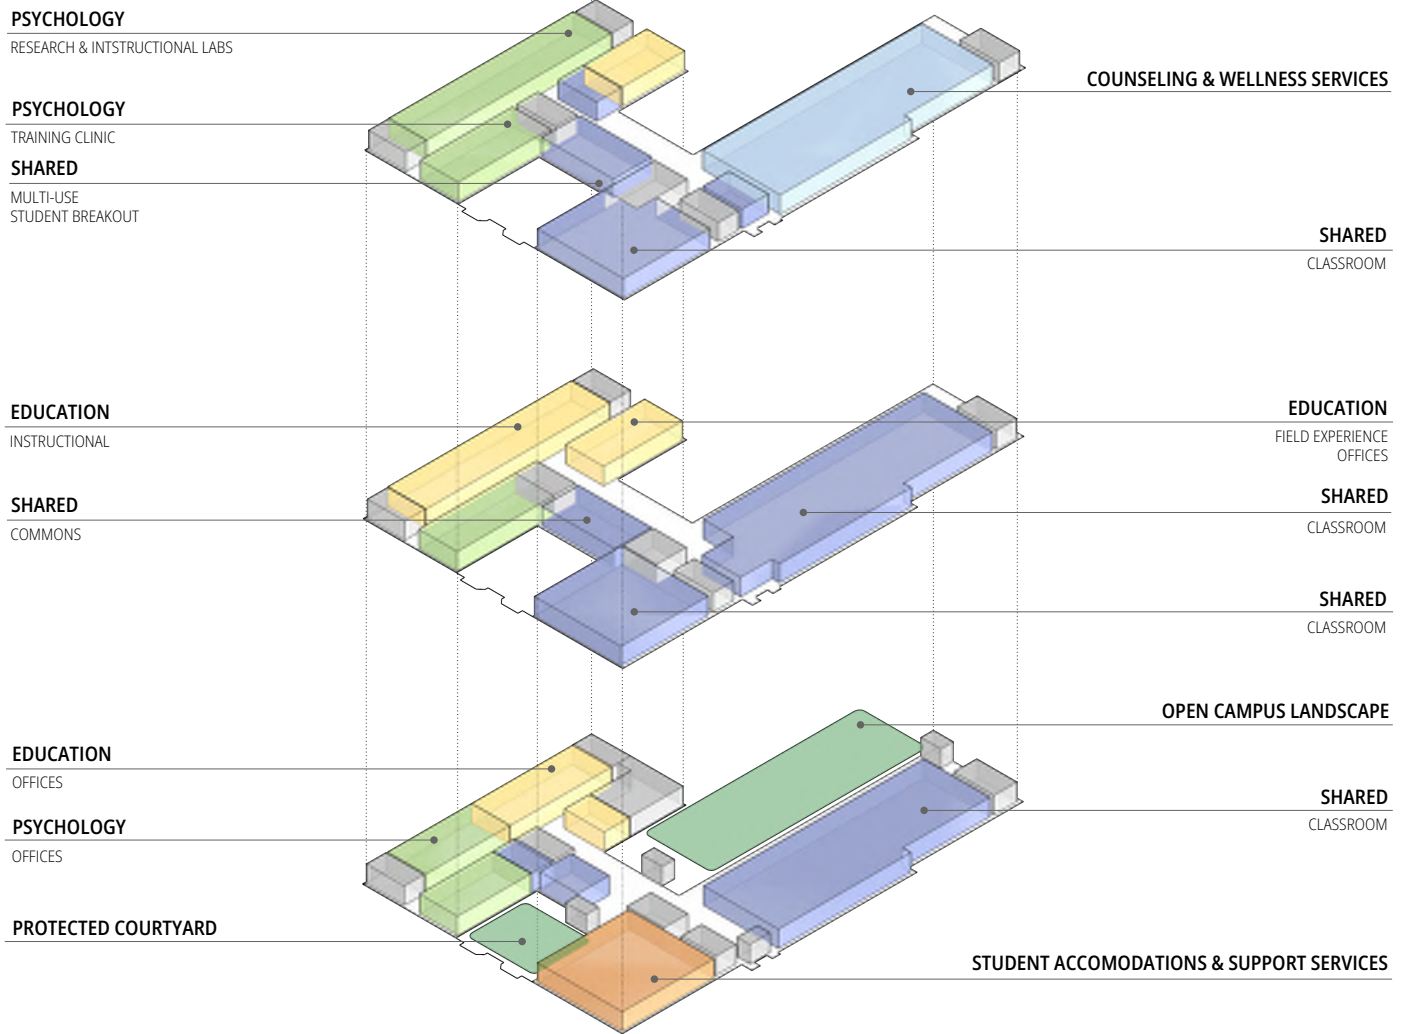

The first bar, closest to the campus core, will contain student support services and shared instructional spaces. This layout will improve circulation within the building and reduce disruptions near department-specific instructional labs and offices. Student Accommodations and Support Services are conveniently located on the first level for easy access, encouraging student engagement, and to reduce stigma around accessing these resources by making them convenient and welcoming. Shared instructional spaces are spread across the first and second levels. Counseling and Wellness Services are placed on the third level to maintain a prominent central campus location while providing students with privacy when seeking support for sensitive matters.

The second bar to the south will contain department-specific instructional labs, offices, administrative areas, and the new training clinic. With lower foot traffic, it aims to minimize disruptions to hands-on learning in the labs and promote interaction between the Department of Education and Department of Psychology through collocation of office neighborhoods.

The two bars converge at a central hub of shared meeting and student-centered spaces, providing a venue for collaboration among departments, faculty, and students. This central area will include Student Breakout spaces, a versatile Commons for open student use and departmental events, and flexible meeting spaces. In addition to facilitating connections between people, this hub provides easy access to two outdoor areas that act as an extension of the communal space within: a protected courtyard and an open campus landscape.

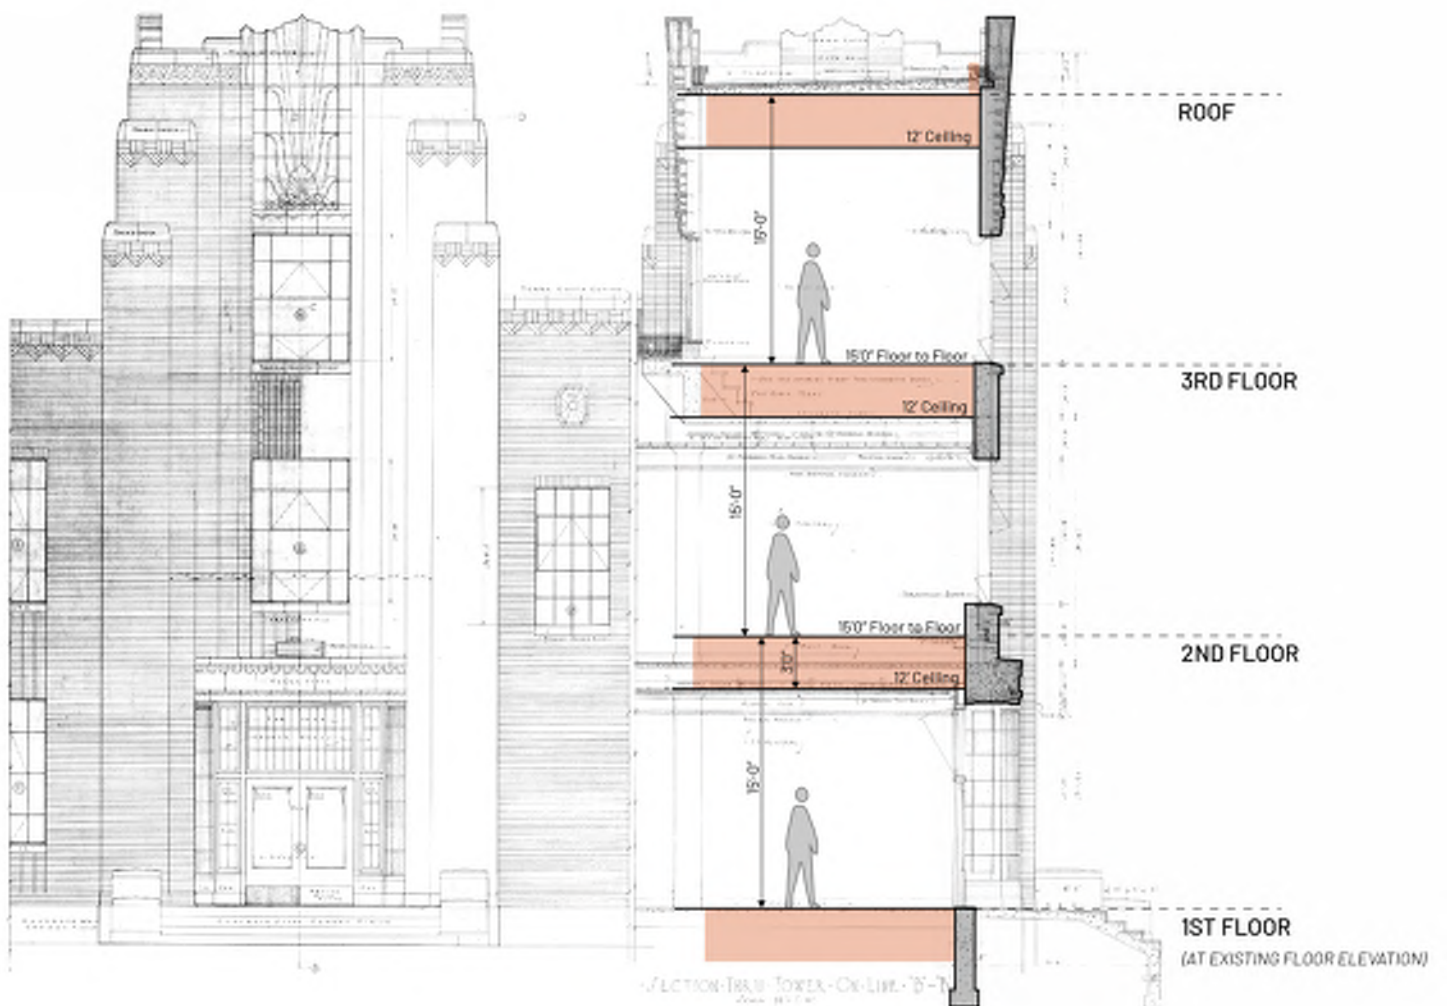

- KEY**
- Program Specific
  - Shared Instructional & Student Services
  - Collaborative & Communal Hub Connector

Program Axonometric

The original 1935 Martin Hall was built as a two-story structure with a low 13'-6" floor-to-floor height. The project will introduce new three-story components with a higher 15'-0" floor to floor height to accommodate modern building infrastructure.

These new three-story volumes will intersect the historic screen on the northeast and southeast facades. These intersections will be carefully crafted to ensure the historic character is preserved while maintaining the functionality within the building.

Section through Tower

4.2 SITE ANALYSIS

The following offers a detailed analysis of the project site.

4.2.1 LOCATION

The proposed site, and only location considered for the project, was the existing location of Martin Williamson Hall. Its present location is not only steeped in historical significance, which EWU is committed to preserving, but is also strategically situated near the center of campus. This central position enhances accessibility to the various student services programs housed within for the broader EWU community. Additionally, its proximity to the historic One Room School House fosters a meaningful connection between the Department of Education and EWU’s beginnings in 1890 as the first institution in Washington for teacher instruction.

Arevalo Student Mall

One Room School House

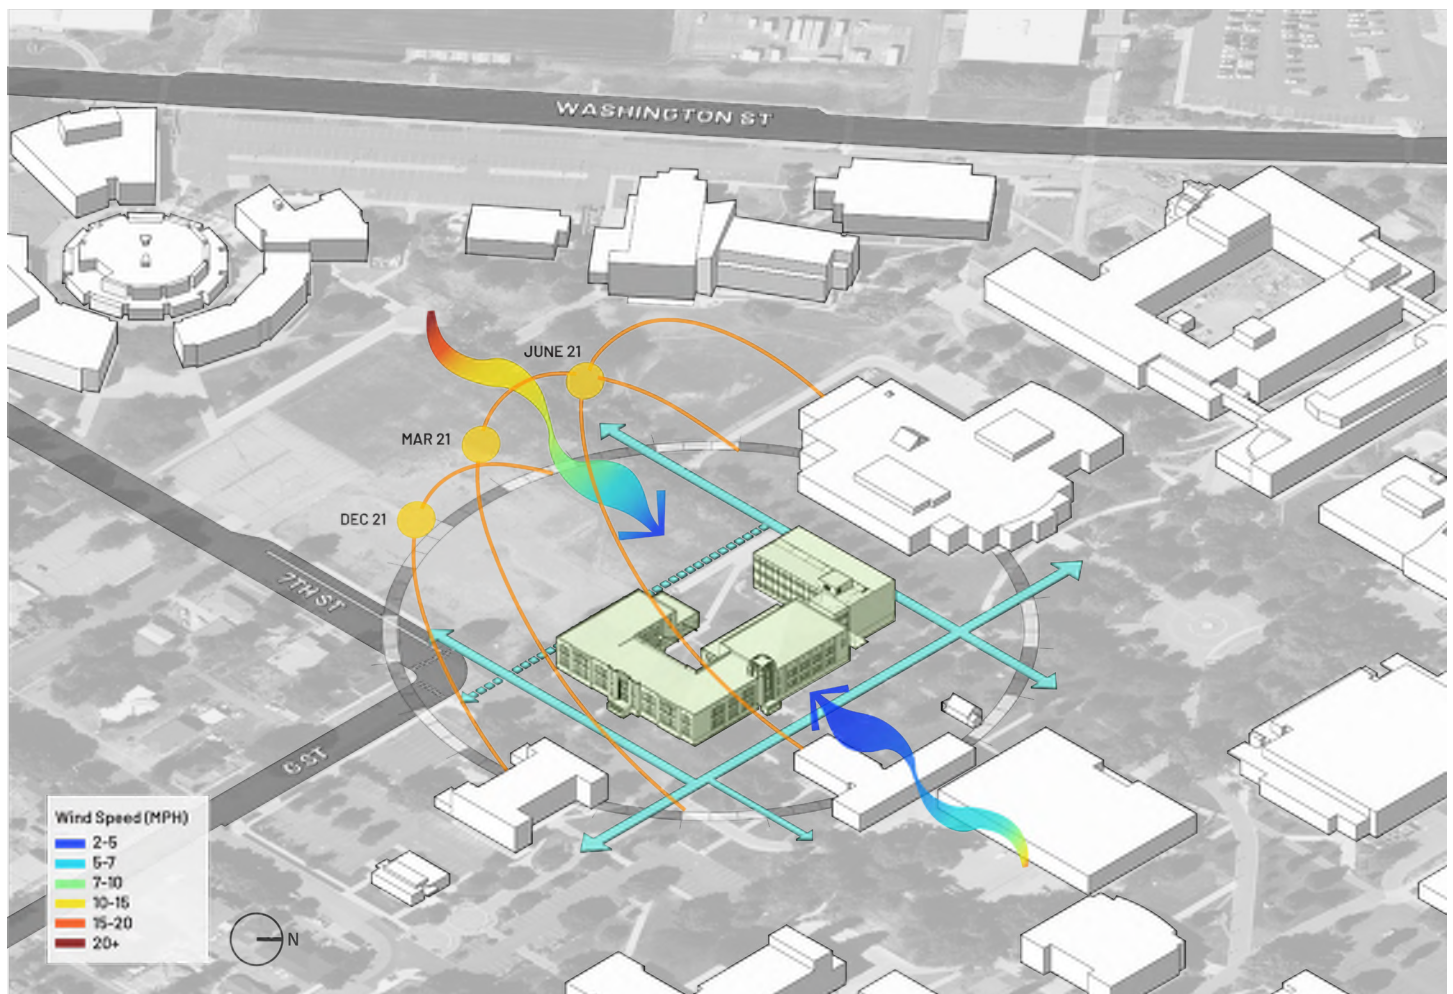

Campus Context Site Map

4.2.2 SITE STUDIES

The university is in the process of procuring the following site studies, which are scheduled to be completed during the Schematic Design phase:

- Environmental Survey Assessment
- Site Topographical & Utility Survey
- Geo Technical Survey
- Traffic Impact Survey

Cheney, Washington, experiences a diverse range of weather throughout the year and features an average of 220-250 days of sun with strong prevailing winds coming from the west and southwest primarily. The existing site has excellent solar access to the south for the proposed photovoltaic system. The building and landscape features will be designed to help shelter entries and outdoor space from inclement weather and wind.

Solar & Wind Study of Existing Martin Williamson

4.2.3 BUILDING AND SITE RELATIONSHIP

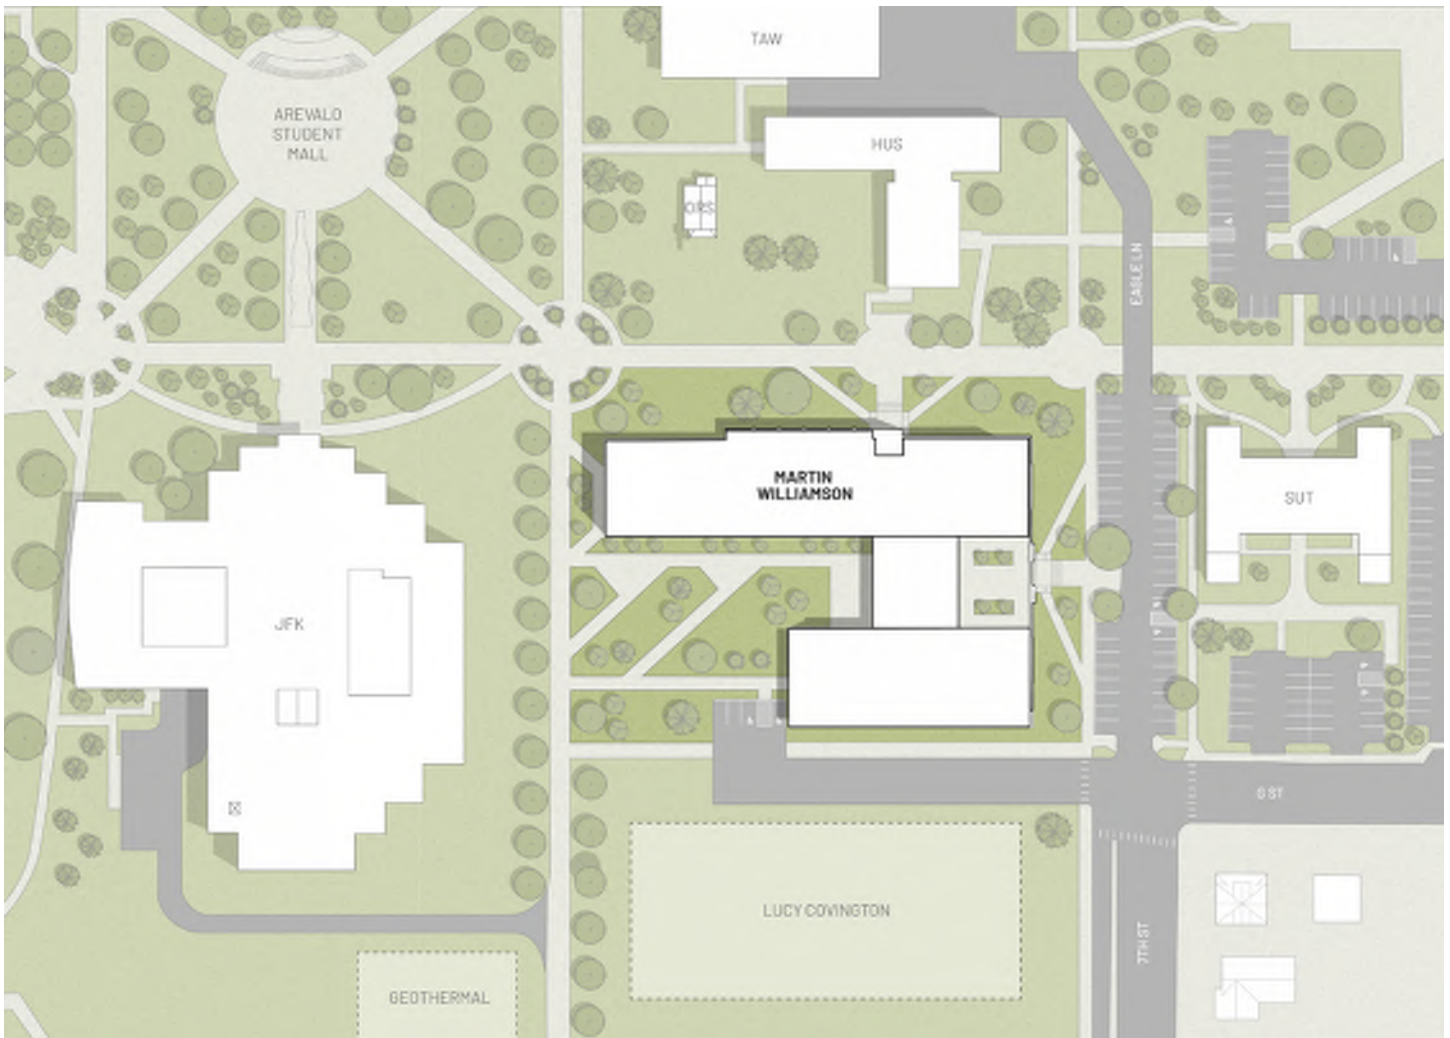

The proposed renovation of Martin Williamson Hall improves key site relationships while retaining significant historical features of Martin Hall.

**Preserved Existing Relationships:**

- The renovation retains the historic presence and connection to the central campus mall.
- This location retains the proximity and visual connection between the Department of Education and the historic One Room School House.
- The renovation retains two prominent ornate historic Martin Hall entries at the northeast and southeast facades.

**New Site Relationships:**

- The renovation improves the sense of entry and welcome at the prominent northwest building corner addressing the central campus mall.
- Safety and security in landscape and outdoor spaces is improved through a more open and visible connection to outdoor spaces.
- The preferred alternative offers a new outdoor experience through a courtyard at the southeast historic entry that is protected from the prevailing winds and harsh solar exposure during warm weather months.
- The renovation improves visibility to and from campus core toward the south which welcomes and draws activity to the campus core.

#### 4.2.4 WATER RIGHTS AND AVAILABILITY

The buildings are within the EWU campus and are served by the University's private water system. Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet. Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of your tap water, backflow assemblies are installed through the campus to protect our water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements. A report is submitted to the Department of Health each year.

EWU's water meets or exceeds all standards set for quality and safety and is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

Extension of campus water mains is not expected, new connections or reconnection to existing campus infrastructure will provide fire and domestic water to the new building.

With the use of modern, low flow plumbing fixtures in the new buildings, a reduction in water use may be expected.

Sanitary sewer connections from the building will be to campus sewer mains, replacing the existing connections.

#### 4.2.5 STORM WATER REQUIREMENTS

The University is within the City of Cheney, which uses the Spokane Regional Stormwater Manual, currently the April 2008 edition, to guide stormwater design. Given the age of these buildings predating any formal storm water design standards, the reconstruction within the approximate footprint, and to the same amount (or less) of impervious area, no extraordinary measures are expected to be needed for mitigation. A detention or infiltration system should not be required, see below for a discussion of water collection and reuse.

If new and replaced pollution generating surfaces (typically motor vehicle drives and parking) exceeding 5,000-sf are created as part of this project, a water quality system will be needed to treat the water before it's discharged to the campus storm water system.

The campus has an initiative to collect water from roof areas in winter and store it in cisterns to be use in summer months for irrigation. If desired, a cistern could be constructed under part of the proposed pedestrian plaza at the building. This is not a required program but has been implemented in other recent campus projects.

To obtain LEED storm water points, the project would need to infiltrate or reuse (irrigation) most of the surface water collected from precipitation.

#### 4.2.6 SITE OWNERSHIP, EASEMENTS AND ACQUISITION

The project site is on the Eastern Washington University campus utilizing the existing site. There would be no change of ownership, acquisition, or easements needed.

#### 4.2.7 SETBACK REQUIREMENTS

The project site is totally within the existing campus, it has no frontage on public streets. With the preservation of the historic façade, no effect on setbacks is expected. To the west and south, where new building façades will be constructed, adjacency to campus walks and drives should be reviewed for visibility of pedestrians and drivers.

#### 4.2.8 NEIGHBORHOOD ISSUES (CONSTRUCTION RELATED)

The site is within the Campus and should not directly affect off campus neighbors. If the old Reid school site is used for a construction yard, the opposite side of 7th St. is a residential neighborhood. The potential for temporary disruption, noise, dust, extra vehicular trips, and deliveries is possible. Location of the construction activity to the west and north ends of this lot will help separate the residents from the temporary disturbance.

#### 4.2.9 NEIGHBORHOOD ISSUES (LONG TERM)

When the project is complete, the use will not change, the building will remain an education and administration facility for the university. Vehicular and pedestrian traffic patterns, rates and frequency should remain similar to current conditions.

#### 4.2.10 UTILITY CONNECTIONS

Buried campus owned primary power lines traverse the western boundary and central core of the site. The central core existing lines appear to be in conflict with the planned location of the building. Buried primary service lines will be relocated and extended from the existing campus infrastructure for new services to the building. An existing pad mounted line switch is located in the middle of the site and will require coordination with site landscape to protect in place.

Buried campus communications lines traverse the western boundary and central core of the site. The central core existing active lines appear to be in conflict with the planned location of the building. Buried comm service lines will be relocated and extended from the existing campus infrastructure for services to the building.

All existing utilities to the campus mains are expected to be re-connected, Water, sewer, storm are in individual buried pipe mains under the streets and walks around the site. Reconnection to existing points of service is expected.

A Campus utility tunnel is located west of Williamson, under the drive between this site and the JFK library. These campus utility tunnels usually contain power, communications, steam, and chilled water. All likely have connection from this tunnel to at least the Williamson Building, and likely to both buildings. Reconnection of the new building to these services would be expected from the campus mains in the existing tunnel.

The campus has a central chilled water plant and central steam plant that distributes chilled water, steam, and steam condensate to the buildings on campus through an underground tunnel system.

The campus tunnel system traverses east-to-west immediately northwest of the proposed Lucy Covington project site and should be protected in place. Chilled water will be provided to the building via an extension to the existing tunnel system to the new building. New dedicated 6"Ø chilled water supply and return piping will be routed through the tunnel to the new building.

The building heating and domestic hot water will be provided by a connection to a new campus low temperature heating water (LTHW) system, which will operate at 120°F. The LTHW will be generated by a new open-source ground coupled heat pump heating plant. The plant is being planned as a separate project. Dedicated 6"Ø low temperature hot water piping will be routed to this building via an extension of the tunnel system or utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.

**Site Paving:**

Site paving will consist of asphalt and concrete per university standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces.

Asphalt for restored parking areas and new loading/utility yard, assume 6-in of ½-in HMA over 6-in Crushed base.

Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement.

At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

**Fire Truck Access:**

Fire truck access can be provided off the parking lot on the east side, at Eagle Lane and from 7th Street. Per a campus fire improvement study from 2007, the walks to the north and west are scheduled to be widened to 20-ft accommodating fire trucks. There are 4 existing fire hydrants within a 300-foot radius of the proposed building. These hydrants are near the corners of the complex.

**Water Supply:**

Water mains: Existing Campus water mains are to the west, north and east faces of the buildings, No relocation or extension of existing mains is expected due to this construction.

A single combined fire and domestic water service will be provided to the building from the University system water line. Analysis from the plumbing and fire design will be required to determine the size of the services for the new building.

**Water Meter:** An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria.

**Sanitary Sewer:**

All floors of the addition m should be able to discharge waste by gravity to the campus sanitary sewer system located off the south edge of the site. At least one new 6-in connection to this system is anticipated, reuse of existing side sewers may be possible, depending on condition and location relative to the new facility.

**Stormwater Treatment and Disposal:**

The University’s stormwater system drains to the City of Cheney’s public storm system. Development of this addition will conform to the City’s current surface water development manual which specifies stormwater design standards. The city has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley.

Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the local campus system. If new and replaced vehicular use pavements exceed 5,000-sf within this project, the water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

**Stormwater flow control system:**

Martin Hall dates from 1937, and Williamson from 1966, both buildings predate the writing and adoption of any drainage codes. The water from these roofs flows into the local campus system and into the city storm mains with no flow control. This condition is grandfathered and given that the new building and associated paving will be approximately the same footprint, flow control (detention) is not required.

If LEED or other sustainable practices are desired, several options may be available to obtain stormwater points for the redeveloped site. For LEED points, most of the water needs to be either infiltrated, or re-used within the LEED boundary.

**Infiltration**

The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Drywells have been used on campus at many of the buildings, overflow from them could be routed to the local storm drains. Verification of local soil infiltration by percolation testing is recommended.

**Cistern to collect precipitation for reuse:**

Collection and holding water in winter for use later in the year is another possible storm water strategy, one nearby objective is to collect water under the quad from nearby buildings. Setting their new building up for such a system may be possible. Alternatively, a cistern could be constructed below the new plaza, with the possibility of reusing storm water for irrigation or other gray water uses.

**Foundation Subdrainage:** A footing and slab drainage system will likely be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system is under the pedestrian plaza north of Martin Hall, and flows east and south to city systems.

**Connection to Campus Utility Tunnel:**

West of the site, under the brick pedestrian walk, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. Below grade, the new building will not directly affect the tunnel. Connection/reconnection to these utilities, through the existing points of connection in the tunnel are expected.

**Future Geothermal Heating**

The campus is developing plans for district heating from deep well geothermal systems. Under a separate project, a network of wells and heat exchangers would be installed nearby and a new low temperature looped pipe network to heat buildings, with low or no carbon footprint.

Depending on the timing of the different projects, partial or full installation of such a system may be warranted in the new Martin-Williamson facility. See mechanical discussion for more detail on such a system.

**Gas Distribution:**

Natural gas service to the campus is provided to the existing buildings by Avista Utilities, most new and renovated buildings on campus are not being reconnected to natural gas.

**4.2.11 POTENTIAL ENVIRONMENTAL IMPACTS**

Given that this proposed project is on a developed site, which has been an active part of the EWU campus for nearly 100-years, no environmental impacts are expected.

No mapped wetlands or other water bodies are near this portion of campus.

There are no shorelines near this area.

A SEPA application will be required for this project.

While under construction, the project will need coverage under the State DOE Construction Stormwater General Permit.

**4.2.12 PARKING AND ACCESS**

There is no significant parking directly associated with either of these buildings, most student parking is clustered around the perimeters of campus, within walking distance of the campus core. About 20 stalls are along the west edge of Eagle Lane, to the east side of Martin Hall. These stalls are not specifically designated for Martin Hall users. Current proposed design does not appear to affect these stalls.

At the south end of Williamson, is a small service/delivery area, with two ADA stalls and a campus service stall. A small dumpster corral is part of this installation.

Allowance for a service area, for deliveries and trash staging should be included in the site design of the new complex.

A location to accommodate the needs of the building, and possibly designed with the potential to be expanded to the old Reid School site when it's redeveloped. A shared service/delivery area would be more economical and use less campus area than separate service/loading/waste facilities for each building.

#### 4.2.13 IMPACT ON SURROUNDINGS DURING CONSTRUCTION

##### **Site Preparation and Excavation:**

Demolition will include removal of both buildings and foundations, leaving the façade of Martin Hall on the north and east faces. Existing utilities will be capped at the edge of work and left for reconnection. All demolished materials will be removed from site, reused, recycled or discarded, in appropriate, legal locations. Site preparation for the project will include removal of the existing paving and miscellaneous site features in the work area.

The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not acceptable for use as structural fill and will be hauled off site. Some large trees very near the buildings and future construction will need to be removed to construct the new facility, and for future maintenance access to the façade.

##### **Temporary Sediment and Erosion Control:**

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks at the site.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction. The size of this project will trigger coverage under the DOE's Construction General Stormwater Permit, with it's record keeping and reporting requirements for quality of water discharged from the construction site.

##### **Temporary Construction Features:**

During construction, site access is expected to be from the empty lot south of the Martin-Williamson site, across the former Reid School parcel. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs. Quarry spall work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

##### **Construction Debris:**

The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from leaving the work areas, or entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

##### **Temporary Construction Impacts:**

Assuming the old Reid School site is used for contractor operations (office trailers, deliveries, staging, laydown, stockpiles, etc.) site access may try to come from the highway, through the town of Cheney, on G or H streets, to campus. This is mostly a residential neighborhood, added large vehicle traffic will be a temporary disturbance to the community. An more desirable alternate path up Washington St. to J/7th Ave. avoids most of the residential area, and runs through the interface between the city and campus areas. Other effects to the surrounding community may be dust which can be mitigated with watering trucks, and temporary ground cover (either straw or mulch) on bare, unworked, soil areas. Fences with fabric panels can help control dust also.

Noise from construction equipment and operations will likely be an issue for both the on and off-campus communities. From demolition through finished building, louder than normal, and sharp, abrupt, noises can be expected. The primary means of noise control will be limiting work hours to normal workdays and hours, as defined by the city.

4.3 CONSISTENCY WITH APPLICABLE LONG-TERM PLANS

Eastern Washington University has plans to revisit their Campus Master Plan starting summer of 2024 and the renovation of Martin Williamson Hall will remain a critical component of their future planning. The Eastern Washington University Comprehensive Master Plan identifies five planning principles that align with the proposed renovation of Martin Williamson. The planning principles and how they are implemented (In Italics) in the design of Martin Williamson are as follows:

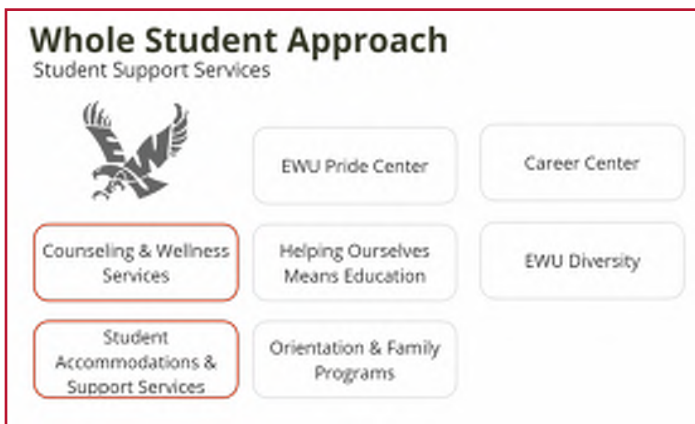

**PLANNING PRINCIPLES**

- Carefully evaluate each project with regard to renovation versus replacement opportunities

*Careful consideration was given to the decision of renovation versus replacement of Martin Williamson. Ultimately, to support the mission and areas needed by the programs housed within, preserving the existing building was not feasible. Previous predesign requests to replace the project have not received funding.*

- Locate and size all new or replacement buildings to optimize site utilization

*The proximity of Martin Williamson in the heart of campus is ideal as 2 or 7 student support services areas (SASS and Counseling and Wellness) are housed within. Additionally it is directly proximate and provides visual connection to the Cheney Normal School Heritage Center (one rooms school house) that represents EWU's beginnings in 1890 as the first institution in Washington for teacher instruction.*

- Improve the overall character of the campus with the implementation of each project

*Martin Williamson has had multiple renovations over its lifetime and very little historical significance exists except for the facade of Martin Hall. With the complete demo and reuse of the facade, this allows the project to incorporate EWU's current design guidelines and improve the overall character of campus.*

- Create and follow a framework that welcomes EWU's neighbors and accommodates future campus expansion beyond existing boundaries

*The campus is only a few blocks from downtown Cheney. The building is designed to provide easy access from both the parking and neighborhoods as well as the campus spine. Green space around the project was maximized to the fullest extent possible.*

- Reinforce and improve the overall cohesion of campus, specifically linkages across Washington Street, whenever possible

*The existing Martin Williamson building has deep roots in the existing campus fabric. Preservation of the existing facade of Martin Hall was prioritized as part of the design effort to ensure its legacy while still creating an outstanding learning environment that supports students success and reflects the hopes and aspirations of the Programs within and the larger EWU community.*

*Southeast aerial view of campus Circa 1960*

#### 4.4 REGULATORY FACTORS

##### 4.4.1 PERFORMANCE PUBLIC BUILDINGS

High Performance Buildings (Chapter 39.35D RCW)

Eastern Washington University has a proven track dating back to 2008 of designing and constructing high-performance buildings using the LEED rating system. This project will select design consultants who embody EWU’s sustainability objectives. This project will be designed, constructed, and certified to the LEED Silver Standard, as a minimum, in accordance with RCW 39.35D. A LEED Checklist, outlining a preliminary approach, has been included in the Appendix. EWU has had a history of achieving LEED silver or higher and will strive to achieve LEED gold on this project.

##### 4.4.2 ZERO ENERGY BUILDINGS

State Efficiency and Environmental Performance (Executive Order 20-01)

The Governor’s Executive Order 20-01 mandates high performance buildings for reduction of greenhouse gases, reduction of pollutants from fossil fuels, and the use of clean energy when technically and economically feasible. Eastern Washington University acknowledges that the costs of constructing zero energy or zero energy capable buildings are nearing parity with conventional buildings. Consequently, the university will further progress its building construction endeavors toward this directive, employing life-cycle cost analysis tools to inform decision-making throughout the design process. The life-cycle cost analysis performed as part of this pre-design included the evaluation of a net zero building. In studying the use of photovoltaic (PV) solar panels for on-site renewable energy generation, the required area of PV panels exceeded the available roof area and would require additional dedicated site area.

EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

### 4.4.3 GREENHOUSE GAS REDUCTION

#### 4.4.3-1 STATE LIMITS

Greenhouse Gas Emissions Policy (RCW 70A.45.070)

The referenced Revised Code of Washington regarding the greenhouse gas emissions reductions requires all state agencies to reduce greenhouse gas emissions as follows:

- i. By 2020 to 1990 levels.
- ii. By 2030 to forty-five percent below 1990 levels.
- iii. By 2040 to seventy percent below 1990 levels.
- iv. By 2050 to ninety-five percent below 1990 levels.

Part of the University’s strategy to cut greenhouse gas emissions involves decreasing reliance on fossil fuels for building energy. The incorporation of energy-efficient HVAC, plumbing, and electrical systems in this proposed facility is crucial for advancing the campus’s goal of reducing overall fossil fuel usage. Given that major capital projects are typically significant energy consumers, prioritizing energy efficiency in the new facility is particularly important.

This project is unique for EWU as it intends to utilize a new all electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers.

EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

### 4.4.4 ARCHAEOLOGICAL AND CULTURAL RESOURCES

In adherence with Executive Order 21-02 and Section 106 of the National Historic Preservation Act of 1966, EWU has initiated consultation with the Washington State Department of Archaeology and Historic Preservation (DAHP), and the Coeur d’Alene, Colville and Spokane Tribes Preservation Programs. The university is committed to working with DAHP throughout the design phase to address historical and cultural resource impacts this proposed project may identify. All proposed construction will be on previously disturbed ground, therefore we do not anticipate any archaeological resources will be uncovered as part of this work. Project specifications will include requirements for an Inadvertent Discovery Plan (IDP) should any artifacts or remains be discovered during excavation.

This project has been remodeled numerous times over the years and much of the historic character has been removed.

### 4.4.5 CLEAN BUILDING ACT

State Energy Standards for Clean Buildings (RCW 19.27A.210)

The Department of Commerce, through RCW 19.27A.210, has developed standards for reducing greenhouse gas emissions from the building sector as published in the Washington State Clean Buildings Performance Standard (2021). The Clean Building Performance Standard has established energy use intensity targets. This building is anticipated to exceed the 50,000 square feet threshold for Tier 1 Buildings, mandating compliance on the building level. EWU monitors their Energy Use Intensity (EUI) as a campus and has been evaluating their overall EUI in relation to the Washington State Clean Building Performance Standard, with a target campus EUI of 112.2. The preferred building option and energy package of this pre-design is anticipated to reduce the campus’ comprehensive EUI from the current value of 118.4 to 111 kBtu/(SF-year), more than a 6% reduction in the campus

EUI. This EUI reduction attributed to the preferred option and energy package is anticipated to bring the campus EUI within the requirements of the Clean Building Performance Standard target EUI of 112.2 kBtu/(SF-year).

As of March 15, 2024, the 2021 Edition of the Washington State Energy Code has been implemented. The project will follow the State Energy Code in place at the time the building is permitted. With progressively more aggressive energy requirements, alongside the phase-out of fossil fuels, facilities will progress towards reducing energy consumption and associated greenhouse gas emissions, as outlined in the Greenhouse Gas Emissions Policy.

#### 4.4.6 VEHICLE CHARGING CAPABILITIES

Vehicle Charging Capability (RCW 19.28)

Where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

#### 4.4.7 AMERICANS WITH DISABILITIES ACT

The purpose of the Americans with Disability Act is to prohibit discrimination based on disability in employment, State and local government, public accommodations, commercial facilities, transportation, and telecommunications. ADA Title II requires that State and local governments provide people with disabilities an equal opportunity to benefit from all the programs, services, and activities (e.g., public education, employment, transportation, recreation, health care, social services, courts, voting and town meetings). This project will adhere to the State requirements for ADA. This project provides ADA parking spaces complete with new ADA compliant walkways/ramps at all building entrances.

#### 4.4.8 PLANNING COMPLIANCE

City of Cheney, Comprehensive Plan

#### 4.4.9 INFORMATION REQUIRED BY RCW 43.88.03.01(1)

The new Martin Williamson is planned in accordance with the Growth Management Act (GMA) RCW 36.70A as required by RCW 43.88.0301(1). The proposed project fully complies with the city's comprehensive plan and zoning codes.

#### 4.4.10 OTHER CODES OR REGULATIONS

City of Cheney Comprehensive Plan

Washington State Environmental Policy Act (SEPA)

State of Washington Department of General Administration – Leadership in Energy and Environmental Design (LEED) – Quality Assurance Process Guidelines for State Agency/College and University Facilities.

### 4.5 PROBLEMS REQUIRING FURTHER STUDY

An additional Site Survey will be required to verify existing utility locations on-site to confirm exact locations of existing infrastructure.

#### Geothermal Infrastructure Study:

Central Geothermal Plant: As part of a separate project, Eastern Washington University will be building a new open source geothermal heating plant. The heating plant will generate heating hot water for building heating and domestic hot water generation.

Funding for this new central plant will be requested separately from this project and is the primary source of heating and domestic hot water generation for this project. If this central plant is not funded alongside this project, an alternative means of heating and domestic hot water generation for the building will be required.

#### 4.6 REQUIREMENTS IN EXCESS OF EXISTING CODE

No items have been identified.

#### 4.7 TECHNOLOGY INFRASTRUCTURE INVESTMENTS

Campus owned outside plant cabling will be provided to the building from the existing campus IT infrastructure. New site communications pathways will be provided to connect the new facility to the existing site utility pathways near the site. Communications rooms will be located throughout the new facility in accordance with EIA/TIA 568 and 569. The main telecom room will be located on the ground level of the building. Each floor of the building will be provided with a minimum of (1) closet. Additional communications rooms will be provided on each floor as needed to ensure that all horizontal station cabling distances will be less than 295 feet from the nearest closet. Cable trays will be provided at accessible ceilings on each floor to support horizontal cabling distribution.

#### 4.8 SECURITY

The site is within the existing campus and will be subject to existing campus security protocols. Pole mounted lighting on the site will be provided for pedestrian walkways and parking areas to support site-related campus security goals. Site lighting illumination levels will be in compliance with IES guidelines and EWU campus standards.

#### 4.9 COMISSIONING

Eastern Washington University will engage a third-party commissioning agent to oversee the project commissioning, adhering to WAC 51-115C-4801 and LEED criteria for energy and water systems. The appointed consultant shall be a member of the Building Commissioning Association and the U.S. Green Building Council and will serve as the University's Commissioning Authority. Their services will enhance the facility's value, bolster maintainability, conserve energy, and enhance indoor environmental quality. Alongside meeting Washington State Energy code and LEED Enhanced Commissioning standards, the agent will also undertake the following responsibilities:

- Development of a commissioning plan.
- Identification of all the roles of the project members, including the University, the Architect/Engineering Consultants, sub-consultants, contractors, and sub-contractors.
- The plan will identify the needs of Eastern Washington University to ensure that functional building requirements are met and to establish the project design intent.
- The commissioning process will begin in the early phases of design and continue through construction to final completion, final acceptance, and the warranty phase.
- Commissioning services will include but not be limited to the following areas of the building operations: energy monitoring, building automation and energy management systems, heating, ventilating and air conditioning systems, lighting controls, plumbing, domestic heating water system, HVAC heating and cooling systems, building enclosure, and renewable power systems.
- In addition to Enhanced Commissioning, Envelope Commissioning as outlined in LEED should be considered.

4.10 FUTURE PHASING

The proposed project includes the necessary areas for the included programs and does not assume any future phasing. Adequate infrastructure is provided to accommodate a future Geothermal connection to the building.

4.11 PROJECT DELIVERY METHODS

4.11.1 DELIVERY METHOD COMPARISON

The project is not pursuing an alternative delivery method. The proposed project does not meet the GCCM or Design Build requirements outlined in RCW 39.10. Both of these delivery methods can be effective, but they would incur additional preconstruction fees for contractor involvement early in the design.

The project will use the Design-Bid-Build (DBB) project delivery method per RCW 39.04 – Public works. This is the delivery method that is most frequently used by Eastern Washington University. The school is familiar and experienced with this delivery method and has found that it has been the most cost-effective by promoting competitive bidding between interested general contractors and subcontractors.

| Position                            | Time On Project | Duties:   |
|-------------------------------------|-----------------|---|
| Director of Construction & Planning | 15%             | Oversees project planning and implementation for campus         |
| Sr. Project Manager                 | 85%             | Supervises construction implementation and project coordination |
| Construction Project Coordinator    | 45%             | Assists with project coordination for campus                    |
| Office Assistant                    | 15%             | Assists with administrative tasks for project                   |
| <b>Totals</b>                       | <b>160%</b>     |   |

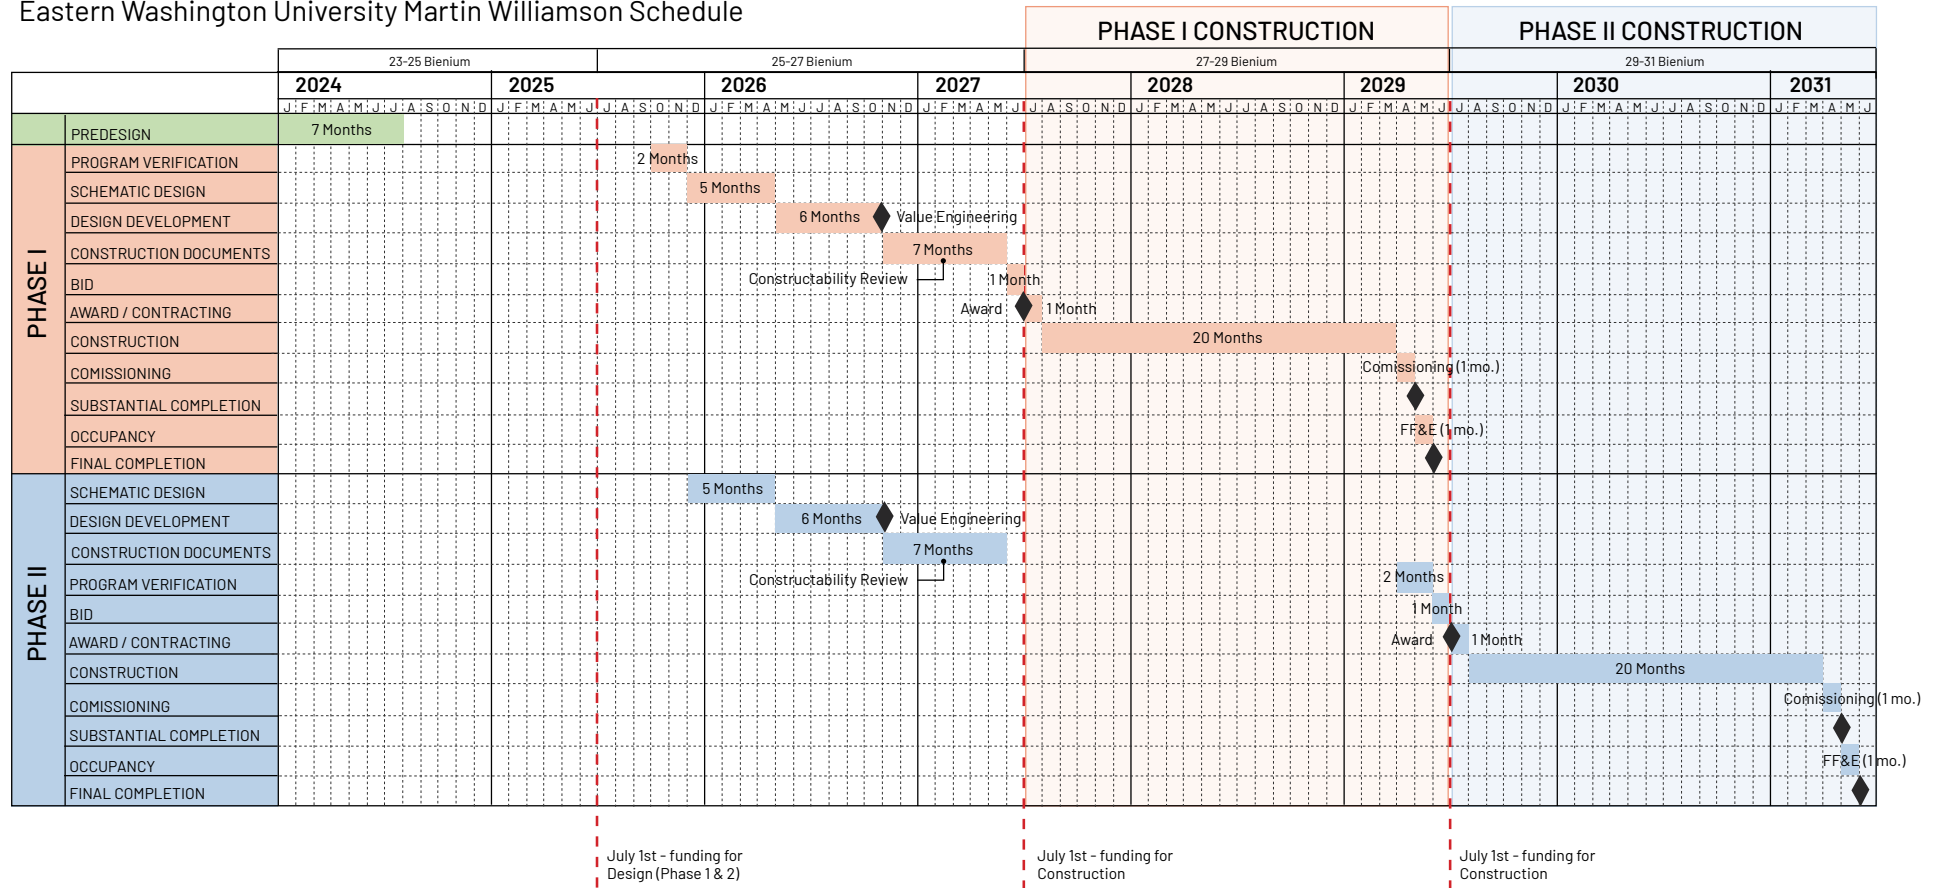

4.11.2 MANAGEMENT ORGANIZATION WITHIN THE AGENCY

Eastern Washington University’s Construction and Planning Division will manage all aspects of the project from programming and initial budgeting of the proposed project to the initial selection of the project architect/engineer(A/E) consultant design team and throughout the subsequent design, bidding, construction, commissioning, and warranty phases. The Construction and Planning Division will oversee the required contractual administration for the project architect/engineer (A/E) consultants and public works contractors. The Construction and Planning team is responsible to work closely with the university’s administration, the design team, and the contractors to ensure the project is delivered on time and within budget.

4.12 SCHEDULE

4.12.1 MILESTONE SCHEDULE

Eastern Washington University Martin Williamson Schedule

Schedule Highlights

- Design for Phase 1 and Phase 2 to occur simultaneously so a complete set of documents for both phases will be completed and permitted at the end of the 2025-2027 Bienium.
- Construction for Phase 1 proposed in the 2027-2029 Bienium
- Construction for Phase 2 proposed in the 2029-2031 Bienium

#### 4.12.2 VALUE ENGINEERING AND ANALYSIS

The project schedule includes time for both a Value Engineering (VE) study and a Constructibility review. The VE study will take place at the end of the Design Development phase and will allow the project team to better understand what project saving opportunities can be found. The Constructibility study will take place at the midpoint of the Construction Documents phase and will be complete with enough time to be incorporated into the building permit submission.

#### 4.12.3 POTENTIAL FACTORS THAT MAY DELAY SCHEDULE

There are no known factors that are expected to delay the design or permitting of the project. The construction schedule may be affected by current supply chain challenges. The project team will mitigate any delays by identifying long lead time items early and will be responsive to allow for early procurement where it is feasible.

The project schedule would be delayed if construction funding is not allotted in the 2027-29 and 2029-2031 bienniums and postponed to a future biennium. This would likely increase project costs due escalation. Costs would likely also increase beyond the standard escalation rates due to potential design and document revisions for code changes, and project restart fees.

#### 4.12.4 LOCAL JURISDICTION COORDINATION

The Authority Having Jurisdiction is the City of Cheney. The project team has already begun coordination with the permitting agencies to better understand the site access and zoning parameters. The team will continue to work with the city to ensure that all development requirements are met and that the required permits are obtained in a timely manner.

# SECTION 5

## BUDGET ANALYSIS

## 5.0 BUDGET ANALYSIS OF PREFERRED ALTERNATIVE

### 5.1 COST ESTIMATE

#### 5.1.1 MAJOR ASSUMPTIONS

##### Phasing – Alternative C – Historic Screen

Construction of this project will occur in two phases. The first phase will include all Division 21, 22, and 23 wet infrastructures sized for both phases. Phase 1 infrastructure to include fire service and riser, domestic water service and backflow prevention, hydronic heating water service and system components, and hydronic chilled water service and system components. Fire, domestic hot and cold water mains, and hydronic mains will be sized and located for connection in phase 2. Sanitary sewer, roof drainage, and air distribution systems will be appropriately sized only for the phase they are installed.

##### Energy System Evaluations

As part of the pre-design, three comprehensive energy packages were studied in the preferred Concept C concept. These three packages are referred to as the Base Package, High Performance Package, and the Net Zero Package. Specific system components studied in each of the three options as follows:

###### Base Package

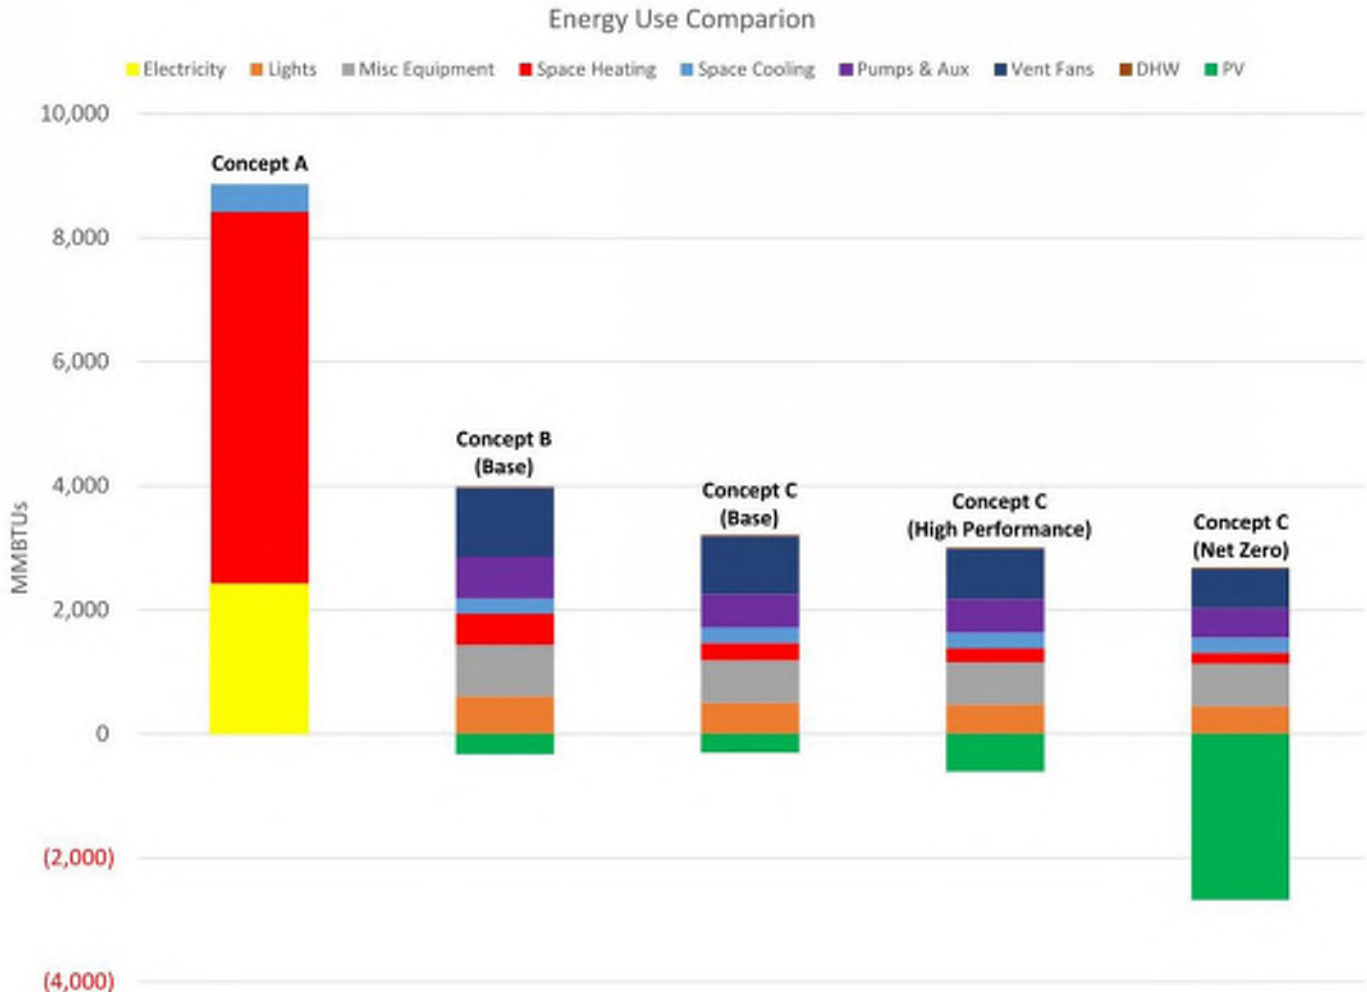

- 124,375 sf new building using two existing exterior facades
- Chilled beams with 68% effective heat recovery for ventilation airflow
- 10% better than WSEC required Lighting power density (LPD)
- Ground coupled heat pump plant for LTHW, chilled water (CW), and domestic hot water (DHW)
- 62 kW photovoltaic (PV) system to meet WSEC requirement of 0.5 Watts (W) per square foot

###### High Performance Package

- Base Package with the following changes:
- 75% effective heat recovery for ventilation airflow
- Displacement ventilation HVAC system for large lecture hall style classroom
- Radiant floor heating and cooling for first floor corridor
- 15% better than WSEC required LPD
- 124 kW PV system

###### Net Zero Package

- High Performance Package with the following changes:
- 90% effective heat recovery for ventilation airflow
- Low pressure ductwork reducing fan power
- 20% better than WSEC required LPD
- High performance glazing (U-Value: 0.28 / SHGC 0.22)
- Horizontal shading on South facing windows
- Vertical shading on East and West facing windows
- 547 kW PV system

Energy results from the Energy Life Cycle Cost Analysis looking at the three concepts and the three energy packages studied within Concept C can be found below. From this study, the preferred option for Concept C is the High Performance energy package. This decision is in response to its impact on bringing the campus EUI within the EUI target required by the Clean Building Performance Standard, and the increased life cycle costs and additional site area required for the on-site renewable energy created by PV.

**A10: Foundations:**

The foundations for new construction will include continuous and spread footings, and perimeter drainage. The existing building’s first floor is a concrete framed floor over a crawlspace. After this floor is demolished, structural fill will be brought in to raise grade for a concrete slab on grade.

**B10: Superstructure:**

At new construction, roof structure will be composed of 1 ½” metal roof deck on steel beams, supported on steel girders and steel columns. Second floor construction will be 5 ½” composite concrete deck supported on composite steel beams and girders, supported on steel columns.

**CLT Option:**

At new construction, roof structure will be composed of 3-ply CLT supported on glulam beams at roughly 14 feet on center, supported on glulam girders and steel columns. Second floor construction will be 5 ½” composite concrete deck supported on composite steel beams and girders, supported on steel columns.

We anticipate the lateral force system for either option will be either CMU shear walls or concentric steel braced frames. It is likely that one or two building joints will be required.

#### **B20: Exterior enclosure:**

Scope of work includes masonry brick veneer and insulated metal panel. The extent of brick will be approximately 80% and 20% insulated metal panels at opaque walls. Glazing scope includes curtain wall and storefront glazing. The extent of the glazing would vary by exposure from approximately 20% to 30% of the gross wall at the existing northeast and southeast facades to 30/40% at classroom, research, offices, Counseling and Student Support Services areas and 40% /80% at circulation/student areas. Other scope would include exterior sunshades. Exterior door scope will include glazed aluminum doors at vestibules and hollow metal doors at other locations.

The existing exterior masonry wall will be shored and braced (design by general contractor) to allow demolition of the existing 1st floor, second floor and roof structure beyond. This bracing system will remain in place until the new structure and lateral system is erected, and the existing wall system is properly tied to the new framing.

#### **B30: Roofing:**

Roof scope of work includes an Built-Up Roofing system with insulation (R-Value at 20% better than code), sheet metal flashings, and rough carpentry. Additional scope includes roof ladders, roof hatch, skylights, and fall restraint anchors.

#### **C10: Interior Construction:**

Interior partitions will consist of metal stud framing, batt insulation and gypsum board, interior glazing, and interior doors. Fittings and specialties will include toilet partitions, white boards, signage, corner guards, miscellaneous, restroom and shower accessories, fire extinguishers and cabinets.

#### **C20: Stairs**

Main stair included HSS tube steel structure with polished precast concrete treads and landings, and aluminum, glass, or cable rail guardrail and decorative stainless-steel railing. Back-of-house stairs will have channel stringers and concrete filled metal pan treads with composite concrete decks at landings and painted guardrail.

#### **C30: Interior Finishes**

Floor finishes include porcelain tile at restrooms, carpet tile and/or resilient flooring in classrooms, counseling, offices, and student support areas, and polished concrete in corridors and large shared or common areas. MEP rooms and storage will be sealed concrete. Ceiling finishes will include ACT, painted GWB, wood beams exposed to structure, acoustical baffles, as well as linear wood grilles.

#### **D10: Conveying systems**

One 3500lb 3-stop hydraulic elevator with motor and adjacent pump is included for access to all floor levels. Elevator to accommodate an ambulance stretcher.

#### **D20: Plumbing**

##### General

The building plumbing systems will comply with Eastern Washington University's campus standards. Water conservation is a high regional priority for Cheney and low consumption fixtures and water conservation strategies shall be employed to provide optimal efficiency and high performance to minimize maintenance.

### Water

Domestic cold water distribution systems will be provided throughout the building. Backflow prevention assemblies will be provided for the system in accordance with the AWWA Backflow Prevention and Control Manual and reviewed with the Cheney Water Division and will be located in the ground floor mechanical room.

A domestic hot water distribution system will be provided throughout the building. Hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F. A hot water recirculation system, controlled through the campus building automation system (BAS), will be provided, and distributed at low velocities, using in-line all-bronze circulating pumps throughout the building.

#### Materials:

- Water Piping: Copper Type L

### Sanitary Waste System

A gravity sanitary sewer system will be utilized for all flushing and flow fixtures with drain connections. All waste systems will discharge five feet outside the building for connection to the site sanitary sewer.

#### Materials:

- Drain, Waste, Vent Piping (above grade) : Cast Iron
- Waste Piping (below grade): PVC, ABS, or cast Iron

### Rainwater Drainage

Gravity primary and overflow storm drainage systems that will be piped with interior roof drain leaders to a point five feet outside the building for connection to the site storm drainage system. Overflow drains will terminate at grade level on splash blocks.

#### Materials:

- Storm Drain Piping (above grade): Cast Iron
- Storm Drain Piping (below grade): PVC, ABS, Cast Iron

### Other Plumbing Systems

At a minimum, isolation valves will be provided for plumbing systems at each floor, at all branch take-offs to individual fixture groups, and each restroom (men's, women's, and gender neutral) with individual isolation valves located on the same floor and within easy access.

Elevator pits will be provided with sump pumps, to comply with Washington L&I requirements, and piped to the sanitary sewer system.

## **D30: Heating, Ventilation and Air Conditioning (HVAC)**

### General

The building HVAC Systems shall comply with Eastern Washington University's campus standards. The proposed mechanical systems are designed for a balance between high energy performance, flexibility, and low maintenance. Systems with the lowest anticipated energy use are proposed. Campus utilities will be metered and interfaced with the Division 23 building automation system.

Outdoor Design Conditions: Heating Systems will be sized for the ASHRAE median of extremes for Cheney, Washington which is -9°F. Cooling systems will be sized for the ASHRAE 0.1% design condition temperature for Cheney, Washington which is 99°F dry bulb and 69°F wet bulb.

Indoor Design Conditions: When occupied, office and classroom spaces will be maintained between 68 and 75°F. Telecommunication rooms will be controlled to 68-75°F 24 hours per day, 7 days per week. Mechanical and electrical spaces will control to 55-85°F.

### Utilities

The building will be heated with low temperature water (120°F) supplied by the new open-source geothermal heating plant. LTHW will be routed to this building via 6"Ø supply and return pipes. The LTHW water will then be distributed through the building via fully redundant building heating water pumps. Air handling equipment exposed to outside air shall be serviced by a dedicated heating water system, freeze protected with 40-50% propylene glycol, separated from the campus LTHW system via a heat exchanger.

This building will be cooled from campus chilled water system, supplied by the existing chiller plant and the new open-source geothermal heating plant. Chilled water will be routed to this building via an extension to the existing tunnel system with 6"Ø supply and return pipes. The chilled water will then be distributed through the building via 60-70% redundant building chilled water pumps. All radiant floor and chilled beam systems utilizing 6-way valves shall be serviced by a dedicated tempered chilled water loop and separated from the campus chilled water system via a heat exchanger to prevent mixing of the new low temperature heating water system from the existing campus chilled water system.

### Ventilation and Exhaust Air

This building has two primary air classifications, as defined by ASHRAE. Spaces with an ASHRAE Air Classification of 1 and 2 will be ventilated in accordance with ASHRAE Standard 62.1: Ventilation and Acceptable Indoor Air Quality. Within these spaces, ventilation air will be ducted via a dedicated outside air system (DOAS). Air will be regulated to each major zone through air terminal units and returned to the unit via return air ducting and regulated from each major zone or on a floor basis using air regulating devices. Ventilation air will be adjusted based upon occupancy and space CO2 levels.

A transpired solar collector will be provided to passively heat the ventilation air before entering the air handling units for heating and cooling. The transpired solar collector will be equipped with louvers that bypass the preheat plenum when the air system is in cooling mode. All outside air intakes will be located away from exhaust vents, plumbing vents, exhaust discharges, smoking areas, loading docks, kiln exhaust, dust collectors, designed to prevent hoar frost buildup, and will take prevailing winds into consideration. Prevailing winds are predominantly from the northwest, but occasionally from the southeast.

### Space Conditioning

Radiant floor heating and cooling should be considered as the primary source of heating and cooling in the main lobby and major corridor spaces.

Supply Air Handling Units for Air Class 1 and 2 spaces: These spaces will be serviced from central dedicated outside air system (DOAS) style air handling unit with supply fans, exhaust fans, filters, chilled water cooling coils, glycol heating water heating coils, a total energy heat wheel or other style of heat recovery, and sized for ventilation needs in these spaces. The DOAS unit will recover a minimum of 68% sensible recovery effectiveness or have an enthalpy recovery ratio of not less than 60 percent at design conditions, in accordance with the 2021 Washington State Energy Code (WSEC), from the conditioned air that is exhausted from the building. Energy recovery efficiency in excess of the WSEC requirements will be considered as part of the project's energy goals. Fans shall be arranged in a fan array for N+1 redundancy, efficiency, and ease of service. Local space temperature control will be provided from active chilled beams.

Each conference room, classroom, and study space will have their own thermostat. Offices will be provided with a minimum of one thermostat for every two offices.

#### Building Automation System

The project will utilize a Direct Digital Control (DDC) system for the control of the HVAC systems, providing for heating and cooling control, peak load demand limiting and start/stop optimization. Damper and valve actuators will be electronic. Room thermostats will be an electronic adjustable type with override switch for occupant activation to occupied mode during unoccupied periods.

*Energy Management System (EMS):* The EMS controls will be compatible with EWU's campus BACnet controls. The system shall be manufactured by Alerton or Automated Logic. Controls will interface and communicate with the local network and front-end operator's terminal for the purpose of remote operation and maintenance. The EMS will include display and report real-time building systems performance data. The EMS controls will provide energy metering interface for the new water, chilled water, low temperature heating water, and electric utilities servicing the building and report to the Skyspark control system.

#### Other

The community space may offer differing hours of operation from the remainder of the building. As a result, a dedicated system should be considered for this area, such as a 4-pipe fan coil with economizer cooling.

Vibration isolation of pumps and fans will be provided. Additional acoustic considerations will include limiting duct velocities through ductwork, terminal units, and air inlets/outlets to achieve space NC, use of sound attenuators in the duct systems, and vibration isolation of mechanical equipment with spring isolators and flexible connections will also be employed.

Areas that have 24-hour process cooling loads such as the main telecommunication rooms will be cooled with systems that allow for year-round cooling and the option for economizer cooling.

The elevator machine room will have an independent stand-alone system per Washington Elevator Code requirements.

A hydronic snowmelt system will be provided for exterior walkways at main entrances and site stairs that are difficult to access with mechanical snow removal equipment. Hydronic heat for the snowmelt system will be generated from a water-to-water heat exchanger connected to the heating water system.

Air systems (supply, return, and exhaust), hydronic, and domestic hot water recirculation systems will be completely balanced in accordance with Associated Air Balance Council or National Environmental Balancing Bureau.

#### **D40: Fire Protection Systems**

The building will be fully sprinklered in accordance with NFPA-13 requirements and the Eastern Washington University Campus Standards. The systems will be a wet sprinkler system throughout the building. Piping shall be sloped to low points for drainage. The building light hazard areas (office, lecture rooms, circulation spaces) will be sprinklered to light hazard requirements. Electrical and mechanical rooms will be sprinklered to ordinary hazard group 1 requirements.

Hydrants will be coordinated with the fire department and, where required, provided in the civil scope of work.

A fire protection standpipe will be required and provided at each exit stairwell if the highest occupied level of the building exceeds 30 feet above grade.

## D50: Electrical

### Power

The building will receive electrical service from the campus owned medium voltage distribution system. New buried conduit pathways, vaults and cabling will be provided from the nearby existing campus medium voltage system to the new building service yard. A total of (2) pad mounted oil filled transformer will be installed on the site to provide normal electrical services to the building.

Electrical services will be derived from the (2) transformers with secondary voltages of 480Y/277V and 208Y/120V. The (2) services will have an estimated rating of 1600 amps and 2000 amps respectively. The main service switchboards will be housed in a dedicated main electrical room at the ground floor. The proposed dual service approach is intended to remove heat producing transformers from inside the building, which would also eliminate the need for electrical room space conditioning.

Emergency and standby power will be provided by an onsite natural gas fueled generator. Estimated generator rating is 100kW with a voltage of 480Y/277V. The generator will include separate automatic transfer switches and distribution for NEC 700 and NEC 702 power systems. The generator ATS equipment shall be housed in a dedicated electrical closet on the ground floor in close proximity to the normal electrical service room. Generator shall be located outdoors on a concrete housekeeping pad with a sound attenuated weatherproof enclosure.

The building electrical distribution will originate from a main electrical room on the ground floor. The building electrical distribution will be designed to provide separation of lighting, mechanical, and general building loads. Circuit breaker panelboards shall be provided throughout the building as required to adequately serve the associated building loads. Each telecommunications room will be provided with a dedicated 120/208V power panelboard and an equipment ground bar. Surge protection shall be provided by installing surge protection devices at the main switchboard, distribution panelboards, emergency panelboards and appropriate branch panelboard locations. All electrical feeders shall copper and installed in rigid conduit.

Branch circuit distribution within each programmatic space will be closely coordinated with the specific function of each space. Additional spare electrical capacity will be designed into each panel to accommodate future potential changes to the building program. Wall mounted surface raceway with receptacles shall be considered for spaces with workstations such as computer labs. Floor boxes will be provided within meeting rooms and classrooms as required by the program and the electrical code. All branch wiring shall copper and installed in rigid conduit.

Owner metering shall be provided for the building main electrical service equipment. Additional sub meters shall be provided for lighting, mechanical, PV system, EV charging and plug loads to allow separate metering for each end use type.

A complete system of photovoltaic arrays shall be provided for on-site renewable energy generation in compliance with the Washington State Energy Code (WSEC). In order for the building to achieve high performance goals, the solar array will be sized for a minimum system output of approximately 124kW. Potential locations for solar arrays include the building roof and site structures such as canopies.

### Lighting

Building interior and exterior lighting will LED type. Lighting illumination levels will be in conformance with IES standards. Lighting power densities will be in conformance with the Washington state energy code. Egress and exit lighting will be provided with backup power from NEC 700 emergency power.

A low voltage lighting control system shall be provided for time-based, sensor-based (both occupancy and daylight), and manual lighting control in compliance with the energy code, LEED and the building program needs. Fixtures with embedded controls shall be considered to allow for lighting zone control changes throughout the life of the building. Switching of receptacles based upon occupancy shall be provided in compliance with the energy code.

#### **D50: Communications**

Existing buried campus communications lines are in conflict with the proposed building location and will be relocated and extended as necessary. New outside plant cabling will be provided as required to serve the new building from the existing campus infrastructure. Existing pathways in close proximity to the building will be extended for connection to the building main telecom room (MDF).

Communications Distribution: Communications building distribution cabling, devices and pathways will be provided by the contractor. Communications riser cabling will be provided from the entrance location to each Communications room. Each Communications room shall be provided with a dedicated 120/208V power panelboard, branch circuits and an equipment ground bar. Communications room power panel shall be served from NEC 702 standby power.

Communication Cabling Pathways: Cable trays will be installed on each level to facilitate cabling installation. All horizontal distribution of Communications risers will occur on the main floor level. Vertical distribution of Communications risers will route vertically through the building via 4" conduit pathways between floors.

Communication Outlets: Communications outlets will be provided throughout the facility at locations such as work stations, computers, printers, projectors, lecterns and wireless access points. Horizontal station cable will be provided and routed to the nearest Communications room located on the associated floor. Category 6 copper twisted pair cabling will be routed through the communications raceway system to each communications outlet in the building. Typically, each outlet will be served with two Category 6 cables.

WiFi Systems: WiFi system pathways, station cabling and outlets will be provided by the contractor. Required locations for wireless access points will be closely coordinated with EWU. All wireless access points will be provided and installed by EWU.

Clock System: Station cabling and outlets shall be provided by the contractor for Owner furnished Owner installed digital clocks.

#### Audio Visual

Audio visual systems will be provided and installed by the contractor. Spaces requiring audio visual system shall include, but not be limited to assembly spaces, classrooms and meeting rooms. The basis of design for assembly spaces and classrooms shall be a hybrid learning classroom which will include projectors, projector screens, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, lecture capture camera and device inputs. Large meeting rooms will require a projector and screen or wall mounted display, reinforced sound and control systems. Small and medium size meeting rooms will require wall mounted display and media control systems. Computer labs will be treated as basic classrooms with either projectors and screen or wall mounted displays, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, and wireless device connectivity.

#### **D50: Security & Fire Alarm**

Distributed Antenna System (DAS): A complete distributed antenna system for emergency responder radio use is not planned for the new building. The contractor shall provide building infrastructure for a future DAS system. Upon completion of the building structure, walls and ceilings the contractor shall provide testing for responder radio coverage.

**Access Control:** A complete access control system will be provided in accordance with EWU campus standards. Required locations for miscellaneous access control devices will be closely coordinated with EWU. Typical spaces to be provided with access control include building office suite entries, exterior entries, classroom doors, MEP closets, telecom closets, and AV closets. Additional access controls shall be considered for building areas that have unique 24/7 access needs for students.

**Video Surveillance (IPCCTV):** Video Surveillance system cabling and pathways will be provided by the contractor. Contractor shall be responsible for installing Owner furnished cameras and camera mounting hardware. Required locations for IPCCTV devices will be closely coordinated with EWU. Typical spaces with IPCCTV devices include building entrances, building circulation, building exterior and parking. The installed cameras will connect to the existing campus IPCCTV network via CAT6 network cabling connections.

**Fire Alarm:** A complete battery backed addressable fire alarm system with manual pull stations, automatic detection and ADA compliant speaker/strobes will be provided throughout the facility. Initiating and annunciation devices will be installed as required by the governing codes, and in accordance with EWU campus standards. Notification devices shall be white in color and labeled ALERT to allow for dual use as mass notification. The building fire sprinkler system will be monitored by the fire alarm system for system flow and shutoff valve tampering. Central reporting capabilities will also be provided with the fire alarm system. Optical smoke imaging devices shall be considered for detection in large multi-story atriums or other large volume spaces. Fire alarm system shall be Edwards EST4 series.

#### **E10: Equipment**

The construction cost includes the supply and installation of all residential appliances to outfit staff break room and kitchenettes throughout. Also included is science prep area equipment, dishwashers, and ice machines. This also includes electrically operated projection screens and associated infrastructure.

#### **E20: Fixed Furnishings**

Fixed furnishings include walk off mats, built in casework and benches, and interior and exterior window treatments.

#### **F10: Demolition**

Major demolition as required to accommodate new construction. Preservation and shoring of the Northeast and Southeast facades to be utilized as part of the new construction.

#### **G10: Site Preparation**

##### Site Preparation and Excavation

Demolition will include removal of both buildings and foundations, leaving the façade of Martin Hall on the north and east faces. Existing utilities will be capped at the edge of work and left for reconnection. All demolished materials will be removed from site, reused, recycled or discarded, in appropriate, legal locations.

Site preparation for the project will include removal of the existing paving and miscellaneous site features in the work area. The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not acceptable for use as structural fill and will be hauled off site. Some large trees very near the buildings and future construction will need to be removed to construct the new facility, and for future maintenance access to the façade.

### Temporary Sediment and Erosion Control

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks at the site.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction.

The size of this project will trigger coverage under the DOE's Construction General Stormwater Permit, with it's record keeping and reporting requirements for quality of water discharged from the construction site.

### Temporary Construction Features

During construction, site access is expected to be from the empty lot south of the Martin-Williamson site, across the former Reid School parcel. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs.

Quarry spill work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

### Construction Debris

The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

### Foundation Subdrainage

A footing and slab drainage system will be incorporated, and discharge into the campus stormwater under adjacent walks and drives. This system discharges to the City system in 7th Street. Most areas of this campus have a thin near surface layer of porous soils, overlaying fractured and solid basalt. Depending on the depth and condition of this soil, an under-slab drainage system may be warranted for the new building. If recommended by geotechnical engineer, under-slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

## **G20: Site Improvements**

### Site Development

The building will be accessed from all four sides, vehicular access could be made from the interior campus drive to the west, as currently used, or from the east near the entry to the P1 parking lot. Facilities for service, deliveries and waste staging should be provided.

Pedestrian access will be accommodated to all four faces of the complex. The historic Martin entrances have stairs at them to access the main level of the building. Revising the stairs with integrated ramps and landings from the adjacent pedestrian walks will accommodate all users, while maintaining the general appearance of the historic entries.

### Site Paving

Site paving will consist of asphalt and concrete per university standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces. Asphalt for restored parking areas and new loading/utility yard, assume 6-in of ½-in HMA over 6-in Crushed base. Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement. At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

### Fire Truck Access

Fire truck access can be provided off the parking lot on the east side, at Eagle Lane and from 7th Street. Per a campus fire improvement study from 2007, the walks to the north and west are scheduled to be widened to 20-ft accommodating fire trucks. There are 4 existing fire hydrants within a 300-foot radius of the proposed building. These hydrants are near the corners of the complex.

### Water Supply

Water mains: Existing Campus water mains are to the west, north and east faces of the buildings, No relocation or extension of existing mains is expected due to this construction. A single combined fire and domestic water service will be provided to the building from the University system water line. Analysis from the plumbing and fire design will be required to determine the size of the services for the new building.

### Water Meter

An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria.

### Sanitary Sewer

All floors of the addition m should be able to discharge waste by gravity to the campus sanitary sewer system located off the south edge of the site. At least one new 6-in connection to this system is anticipated, reuse of existing side sewers may be possible, depending on condition and location relative to the new facility.

### Stormwater Treatment and Disposal

The University's stormwater system drains to the City of Cheney's public storm system. Development of this addition will conform to the City's current surface water development manual which specifies stormwater design standards. The city has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley. Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the local campus system. If new and replaced vehicular use pavements exceed 5,000-sf within this project, the water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

### Stormwater flow control system

Martin Hall dates from 1937, and Williamson from 1966, both buildings predate the writing and adoption of any drainage codes. The water from these roofs flows into the local campus system and into the city storm mains with no flow control. This condition is grandfathered and given that the new building and associated paving will be approximately the same footprint, flow control (detention) is not required.

If LEED or other sustainable practices are desired, several options may be available to obtain stormwater points for the redeveloped site. For LEED points, most of the water needs to be either infiltrated, or re-used within the LEED boundary.

### Infiltration

The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Drywells have been used on campus at many of the buildings, overflow from them could be routed to the local storm drains. Verification of local soil infiltration by percolation testing is recommended.

### Cistern to collect precipitation for reuse

Collection and holding water in winter for use later in the year is another possible storm water strategy, one nearby objective is to collect water under the quad from nearby buildings. Setting their new building up for such a system may be possible. Alternatively, a cistern could be constructed below the new plaza, with the possibility of reusing storm water for irrigation or other gray water uses.

### Foundation Subdrainage

A footing and slab drainage system will likely be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drainpipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system is under the pedestrian plaza north of Martin Hall, and flows east and south to city systems.

### Connection to Campus Utility Tunnel

West of the site, under the brick pedestrian walk, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. Below grade, the new building will not directly affect the tunnel.

Connection/reconnection to these utilities, through the existing points of connection in the tunnel are expected.

### Future Geothermal Heating

The campus is developing plans for district heating from deep well geothermal systems. Under a separate project, a network of wells and heat exchangers would be installed nearby and a new low temperature looped pipe network to heat buildings, with low or no carbon footprint. Depending on the timing of the different projects, partial or full installation of such a system may be warranted in the new Martin-Williamson facility. See mechanical discussion for more detail on such a system.

### Gas Distribution

Natural gas service to the campus is provided to the existing buildings by Avista Utilities, most new and renovated buildings on campus are not being reconnected to natural gas.

## **G30: Landscaping and Irrigation**

Part of EWU's Landscape Master plan is to Promote Education, Demonstration, Experimentation, and Involvement. Campus landscapes and outdoor environments want to be used for teaching and research and facilitate connections between students, faculty and staff. Plantings will be selected with drought tolerance and prioritizing native species, creating a regionally appropriate campus planting palate and promoting biodiversity.

EWU has begun the implementation of a central controls system for irrigation. This will allow EWU maintenance staff to have much more oversight, and the ability to monitor and adjust irrigation timing to maximize efficiency.

5.1.2 SUMMARY TABLE

The following tables outline the cost summary of the preferred alternative. The complete C100 documents for both Phase 1 and Phase 2 and associated cost estimates are included in the Appendix.

| <b>Summary Construction Budget of Preferred Alternative</b> |                     |                     |                     |
|---|---------------------|---------------------|---------------------|
|   | <b>Phase 1</b>      | <b>Phase 2</b>      | <b>TOTAL</b>        |
| G10 - Site Preparation                                      | \$295,497           | \$313,043           | \$608,540           |
| G20 - Site Improvements                                     | \$295,245           | \$316,595           | \$611,840           |
| G30 - Site Mechanical Utilities                             | \$153,090           | \$192,710           | \$345,800           |
| G40 - Site Electrical Utilities                             | \$420,000           | \$140,000           | \$560,000           |
| G60 - Other Site Construction                               | \$137,500           | \$0                 | \$137,500           |
| Design Contingency  | \$260,266           | \$192,470           | \$452,736           |
| Contractor Mark-Up  | \$93,696            | \$69,289            | \$162,985           |
| <b>Site Work Subtotal</b>                                   | <b>\$1,655,294</b>  | <b>\$1,224,107</b>  | <b>\$2,879,401</b>  |
| Full Building Demolition                                    | \$2,280,000         | \$0                 | \$2,280,000         |

5.2 PROPOSED FUNDING

5.2.1 FUND SOURCES

The proposed project is expected to be funded through state General Obligation Bonds. Design funding is being requested as a first priority in the 2025-27 Capital Budget. Construction for the Phase 1 funding will be requested as part of the 2027-2029 capital budget and the Phase 2 funding will be requested in the 2029-2031 capital budget.

5.2.2 ALTERNATIVE FINANCE ASSUMPTIONS

The project does not plan to use any alternative finance options.

5.2.3 BIENIA BREAKDOWN

The preferred alternative funding for both Phases are shown below. Design funding for both Phase 1 and Phase 2 are requested in the 25-27 Biennium. This allows the complete project to be designed and permitted under the same code cycles and provides design and construction continuity. Construction for Phase 1 is requested in the 27-29 Biennium as is the portion of the consultant services dedicated to CA. Construction for Phase 2 will be requested in the 29-31 Biennium as well as the portion of consultant services dedicated to CA. Project Admin for EWU will be allocated across all three Biennia for continual project oversight.

| Escalated Project Costs                    | 23-25 Bienium    | 25-27 Bienium       | 27-29 Bienium       | 29-31 Bienium       |
|--|------------------|---------------------|---------------------|---------------------|
| Predesign                                  | \$281,446        |                     |                     |                     |
| Consultant Services - Design (Phase 1)     |                  | \$6,442,235         |                     |                     |
| Consultant Services - Design (Phase 2)     |                  | \$4,495,038         |                     |                     |
| Consultant Services - CA (Phase 1)         |                  |                     | \$2,065,509         |                     |
| Consultant Services - CA (Phase 2)         |                  |                     |                     | \$1,622,929         |
| Construction (Phase 1)                     |                  |                     | \$73,112,861        |                     |
| Construction (Phase 2)                     |                  |                     |                     | \$53,879,081        |
| Project Admin Agency (Phase 1 and Phase 2) |                  | \$1,628,320         | \$1,628,320         | \$1,628,320         |
| Equipment (Phase 1 and Phase 2)            |                  |                     | \$3,762,394         | \$2,973,101         |
| Artwork (Phase 1 and Phase 2)              |                  |                     |                     | \$767,598           |
| <b>Projected Costs/Yr</b>                  | <b>\$281,446</b> | <b>\$12,565,593</b> | <b>\$80,569,084</b> | <b>\$60,871,029</b> |

5.3 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS

5.3.1 OPERATING BUDGET IMPACT

The proposed project is expected to increase the schools ongoing maintenance and operations costs. These costs have been estimated based on assumed occupancy in June 2029 for Phase 1 and June 2031 for Phase 2. Funding for the increase in operating cost will be requested within the overall state appropriated budget.

5.3.2 OPERATING COSTS

The following charts illustrate the projected maintenance and operations costs over the first six biennial of the building occupancy.

| M&O Expense               | 31-32 Bienium  |                | 33-34 Bienium  |                | 35-37 Bienium  |                |
|---------------------------|----------------|----------------|----------------|----------------|----------------|----------------|
|                           | 2031           | 2032           | 2033           | 2034           | 2035           | 2036           |
| Utilities                 | \$4.65         | \$4.78         | \$4.93         | \$5.08         | \$5.23         | \$5.39         |
| Building Maintenance      | \$3.25         | \$3.35         | \$3.45         | \$3.56         | \$3.66         | \$3.77         |
| Custodial & Grounds       | \$4.25         | \$4.38         | \$4.51         | \$4.65         | \$4.79         | \$4.93         |
| Ops & Mgmt Support        | \$4.45         | \$4.58         | \$4.72         | \$4.86         | \$5.01         | \$5.16         |
| <b>Projected Costs/Yr</b> | <b>\$16.60</b> | <b>\$17.10</b> | <b>\$17.61</b> | <b>\$18.14</b> | <b>\$18.69</b> | <b>\$19.25</b> |

| M&O Expense               | 37-38 Bienium  |                | 39-40 Bienium  |                | 41-42 Bienium  |                |
|---------------------------|----------------|----------------|----------------|----------------|----------------|----------------|
|                           | 2037           | 2038           | 2039           | 2040           | 2041           | 2042           |
| Utilities                 | \$5.55         | \$5.71         | \$5.88         | \$6.06         | \$6.24         | \$6.43         |
| Building Maintenance      | \$3.89         | \$4.00         | \$4.12         | \$4.25         | \$4.37         | \$4.51         |
| Custodial & Grounds       | \$5.08         | \$5.23         | \$5.39         | \$5.55         | \$5.72         | \$5.89         |
| Ops & Mgmt Support        | \$5.31         | \$5.47         | \$5.64         | \$5.81         | \$5.98         | \$6.16         |
| <b>Projected Costs/Yr</b> | <b>\$19.83</b> | <b>\$20.42</b> | <b>\$21.03</b> | <b>\$21.66</b> | <b>\$22.31</b> | <b>\$22.98</b> |

5.3.3 MAINTENANCE AND OPERATIONS RESPONSIBILITY

The university as the owner will be responsible for all ongoing maintenance and operations. The building renovation will result in increased maintenance costs for the campus, however energy costs will be significantly reduced. The renovated building will require an increase in custodial, maintenance, and technology staff.

| New Building Operating Costs | Change in FTE from current levels |
|------------------------------|-----------------------------------|
| Utilities                    | No change                         |
| Janitorial Services          | + .5 FTE                          |
| Grounds                      | No change                         |
| Security                     | No change                         |
| Maintenance and Repair       | + .25 FTE                         |
| Management                   | No change                         |
| Technology                   | + .25 FTE                         |
| <b>Total Increase in FTE</b> | <b>+ 1 FTE</b>                    |

5.4 FURNITURE, FIXTURES AND EQUIPMENT

The Budget for furniture, fixtures, and equipment has been included in the C-100 cost outline. This budget includes built-in items such as casework and equipment that will require coordinating with building systems and utilities. The budget also includes funds for information technology, telecommunication, and audio-visual equipment.

# SECTION 6

## APPENDICES

### 6.1 PREDESIGN CHECKLIST

- (c) Identify consultant services, DES resources or additional staff needed to manage the project.

L. Schedule

- vii. Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
- viii. Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110\(5\)\(c\)](#).
- ix. Describe factors that may delay the project schedule, such as an environmentally sensitive location, possible presence of archaeological or historical assets, or possible contamination of the site or buildings undergoing renovation.
- x. Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
- xi. Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are part of the process.

**Project budget analysis for the preferred alternative**

- A. Cost estimate. Provide the following:
  - i. Major assumptions used in preparing the cost estimate
  - ii. Summary table of Uniformat II Level 2 cost estimates
  - iii. The [C-100](#) in Excel
- B. Proposed funding
  - i. Identify the fund sources and expected receipt of the funds.
  - ii. If alternatively financed, such as through a Certificate of Participation (COP), provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates. For assistance, please contact [Brianna May, Office of the State Treasurer, 360-902-9022](#) or [email](#).
- C. Facility operations and maintenance requirements
  - i. Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - ii. Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repairs, replacement, and maintenance.
  - iii. Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- D. Furniture, fixtures, and equipment. Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

### 8.3 Appendices

#### Appendix 1: Predesign checklist and outline

A predesign should include the content detailed here. OFM will approve limited scope predesigns on a case-by-case basis.

#### **Executive summary**

Problem statement, opportunity, or program requirement

- Identify the problem, opportunity, or program requirement that the project addresses and how it will be accomplished.

- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location, or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals, and objectives; statutory requirements; and the problem, opportunity, or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

### **Analysis of alternatives (including the preferred alternative)**

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost [Model](#) (RCW [39.35B.050](#)).
    - Schedule estimates for each alternative. Estimate the start, midpoint, and completion dates.

### **Detailed analysis of preferred alternative**

- Nature of space – how much of the proposed space will be used for what purpose (i.e., office, lab, conference, classroom, etc.)
- Occupancy numbers.
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site analysis:
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floorplans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
  - Consistency with applicable long-term plans (such as the Thurston County and Capitol campus master plans and agency or area master plans) as required by RCW 43.88.110.

- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter [39.35D](#) RCW).
  - State efficiency and environmental performance, if applicable (Executive Order [20-01](#)).
  - State energy standards for clean buildings (RCW [19.27A.210](#)).
  - Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW [19.27.540](#)).
  - Greenhouse gas emissions reduction policy (RCW [70.235.070](#)).
  - Archeological and cultural resources (Executive Order [21-02](#) and [Section 106](#) of the National Historic Preservation Act of 1966). If mitigation is anticipated, please note this in the predesign with narrative about how mitigation is worked into the project schedule and budget.
  - Americans with Disabilities Act (ADA) implementation (Executive Order [96-04](#)).
  - Compliance with planning under Chapter [36.70A](#) RCW, as required by RCW [43.88.0301](#).
  - Information required by RCW [43.88.0301](#)(1).
  - Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project, including impacts to current lease contracts. Include detail on the need to backfill space or cost assumptions for vacant space.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative. The proposed method of project delivery must be justified.
- Describe how the project will be managed within the agency.
- Schedule.
  - Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
  - Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110\(5\)\(c\)](#).
  - Describe factors that may delay the project schedule.
  - Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
  - Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

## Project budget analysis for the preferred alternative

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The [C-100](#).
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
  - If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement, and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

## Pre-design appendices

- Completed Life Cycle Cost [Model](#).
- A letter from DAHP.
- Title report for projects including proposed acquisition.

## Appendix 2: Glossary

**Acquisition.** This type of project includes the acquisition of land, structures, and buildings. These are fixed assets that have no relationship to the addition or improvement to, or the repair or replacement of, existing fixed assets. Examples of an acquisition are the purchase of a tract of land or a building.

**Alternate financing.** Proposals that cover a wide range of financial contracts that call for the development or use of space by state agencies through a contractual arrangement with a developer or financing entity. Financing may involve the sale of debt obligations (certificates of participation, or COPs, through the State Treasurer) or funding from a private developer. Title to the property involved may transfer to the state either upon exercise of an option or at the termination of the contract.

**Constructability review.** A review by an independent consultant or contractor to determine if a project can be physically built as designed. This is to reduce construction change orders and claims. Conduct this review at 75–95 percent completion of the construction documents.

**Consultant.** A person or entity who provides advice or services to an agency/institution.

**Contractor.** A person, firm, or corporation who, in the pursuit of an independent business, undertakes or submits a bid to construct, alter, repair, add to, subtract from, improve, move, or

#### COMMENTS:

Design, Bid, Build delivery method is assumed

Assumes a Q3, 2027 start and a 40 month schedule

Escalation is predicted to be 4% in 2024 and 4% through 2027.

Estimate excludes soft costs such as design fees, permits, testing / inspections, construction change order contingencies, loose fixtures / furnishings and sales tax.

**What is planned for the requested new appropriation? (Ex. Acquisition and design, phase 1 construction, etc. )**

Full Building Design Services (Phase 1 and Phase 2 Consultant Services)

(Note: Phase 2 design services is included in Phase 2 -C100)

**What has been completed or is underway with a previous appropriation?**

Pre-design Services were retained in 2023-2025 Biennium

**What is planned with a future appropriation?**

2027-2029 Phase 1 Construction/Closeout Services

2029-2031 Phase 2 Construction - (See Phase 2 - C100)
