# SECTION 6

## APPENDICES

June 6, 2024

Ms. Maddie Levesque  
Architectural Historian  
Washington State Department of Archaeology & Historic Preservation

Mr. Rob Whitlam, Ph.D.  
State Archaeologist  
Washington State Department of Archaeology & Historic Preservation

*RE: Proposed Project at Eastern Washington University  
Martin / Williamson Hall  
EWU Project No. CP1133*

Dear Ms. Leveque and Mr. Whitlam:

This letter is to notify you of a proposed project at Martin-Williamson Hall on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the college intends to submit a predesign for state review/approval of the project on June 30, 2024.

This project is proposed as a replacement of the existing Martin and Williamson Halls on the original building site. The building is proposed to be a three-story structure totaling ~124,400 gross square feet and will house the Psychology and Education Departments, Counseling/Wellness Services, and student support services/accommodations. A phased approach to construction will be utilized (over multiple biennia) as portions of the building will be occupied while under construction.

Throughout the years, both Martin and Williamson Halls have been renovated numerous times destroying the original historic character of the interior. However, the exterior façade retains a high level of integrity. This project proposes demolition of the existing floor plates which do not align with the needs of the Psychology and Education Departments while preserving two of Martin Hall's 1935 historic facades – the northeast and southeast elevations. This approach aligns most closely with EWU's institutional mission and overarching goals, the diverse needs for the academic and student service programs housed in the facility, as well as the state mandated building energy performance criteria.

Proposed construction will be located entirely on previously disturbed ground. See also attached photos and proposed site plan.

Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving of an already existing drive for ADA parking and service access, and the addition of two ADA ramps will be installed at the main entry. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Property: Eastern Washington University (EWU) - Martin/Williamson Hall Predesign  
Re:

Dear Kris:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Officer (SHPO) under provisions of Governor's Executive Order 21-02 and the Office of Financial Management's requirement for DAHP predesign review on capital funded projects. Our review is based upon documentation contained in your communication.

It is our opinion that Property ID: 157306, Martin/Williamson Hall is eligible for listing in the National Register of Historic Places for its association with Eastern Washington University history and representing a significant and distinct architectural style. So, the project will likely result in an adverse impact if heavily altered in the implementation of the suggested predesign scope. We recommend keeping DAHP involved in the predesign phase as much as possible to minimize this impact as much as possible.

Also, we appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult for this project. Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A

*RE: Proposed Project at Eastern Washington University  
Martin Williamson Hall  
Integrus Project No. 22282*

Mr. Abrahamson:

This letter is to notify you of a proposed project at Martin-Williamson Hall on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the college intends to submit a predesign for state review/approval of the project on June 30, 2024.

This project is proposed as a replacement of the existing Martin and Williamson Halls on the original building site. The building is proposed to be a three-story structure totaling ~124,400 gross square feet and will house the Psychology and Education Departments, Counseling/Wellness Services, and student support services/accommodations. A phased approach to construction will be utilized (over multiple biennia) as portions of the building will be occupied while under construction.

Throughout the years, both Martin and Williamson Halls have been renovated numerous times destroying the original historic character of the interior. However, the exterior façade retains a high level of integrity. This project proposes demolition of the existing floor plates which do not align with the needs of the Psychology and Education Departments while preserving two of Martin Hall's historic facades – the northeast and southeast elevations. This approach aligns most closely with EWU's institutional mission and overarching goals, the diverse needs for the academic and student service programs housed in the facility, as well as the state mandated building energy performance criteria.

The proposed construction will be located entirely on previously disturbed ground. Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving of an already existing drive for ADA parking and service access, and the addition of two ADA ramps will be installed at the main entry.

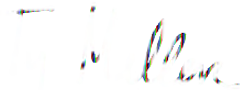

A site diagram illustrating this area of work is attached.

EWU: Martin Williamson Hall  
Page 2  
6/12/24

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Sincerely,  
INTEGRUS ARCHITECTURE, P.S.

Ty Miller  
Project Manager

**To:** Ty Miller, Leed AP BD&C project manager

**RE: Proposed project at Eastern Wash University Martin Williamson Hall**

Mr. Miller,

Thank you for contacting the Tribe's Historic Preservation Office. We appreciate the opportunity to provide a cultural consult for your project, the intent of this process is to preserve and protect all cultural resources whenever protection is feasible.

After archive research of the project mentioned above, this project is all renovation work and other components therefore: I have no further concern on this project.

**RE:** This project will require an **inadvertent discovery plan of action** implemented into the scope of work.

This letter is your notification that your project has been cleared, and your project may move forward. As always, if any artifacts or human remains are found upon excavation, this office should be immediately notified and the work in the immediate area **cease**.

Should additional information become available, or scope of work change our assessment may be revised. Again, thank you for this opportunity to comment and consider this a positive action that will assist in protecting our shared heritage.

If questions arise, please contact me at (509) 258 – 4222.

Sincerely,

Randy Abrahamson  
Tribal Historic Preservation Officer - THPO

*RE: Proposed Project at Eastern Washington University  
Martin / Williamson Hall  
EWU Project No. CP1133*

Dear Ms. Leveque and Mr. Whitlam:

This letter is to notify you of a proposed project at Martin-Williamson Hall on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the college intends to submit a predesign for state review/approval of the project on June 30, 2024.

This project is proposed as a replacement of the existing Martin and Williamson Halls on the original building site. The building is proposed to be a three-story structure totaling ~124,400 gross square feet and will house the Psychology and Education Departments, Counseling/Wellness Services, and student support services/accommodations. A phased approach to construction will be utilized (over multiple biennia) as portions of the building will be occupied while under construction.

Throughout the years, both Martin and Williamson Halls have been renovated numerous times destroying the original historic character of the interior. However, the exterior façade retains a high level of integrity. This project proposes demolition of the existing floor plates which do not align with the needs of the Psychology and Education Departments while preserving two of Martin Hall's 1935 historic facades – the northeast and southeast elevations. This approach aligns most closely with EWU's institutional mission and overarching goals, the diverse needs for the academic and student service programs housed in the facility, as well as the state mandated building energy performance criteria.

Proposed construction will be located entirely on previously disturbed ground. See also attached photos and proposed site plan.

Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving of an already existing drive for ADA parking and service access, and the addition of two ADA ramps will be installed at the main entry. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Property: Eastern Washington University (EWU) - Martin/Williamson Hall Predesign  
Re:

Dear Kris:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Officer (SHPO) under provisions of Governor's Executive Order 21-02 and the Office of Financial Management's requirement for DAHP predesign review on capital funded projects. Our review is based upon documentation contained in your communication.

It is our opinion that Property ID: 157306, Martin/Williamson Hall is eligible for listing in the National Register of Historic Places for its association with Eastern Washington University history and representing a significant and distinct architectural style. So, the project will likely result in an adverse impact if heavily altered in the implementation of the suggested predesign scope. We recommend keeping DAHP involved in the predesign phase as much as possible to minimize this impact as much as possible.

Also, we appreciate receiving any correspondence or comments from concerned tribes or other parties that you receive as you consult for this project. Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A  
Architectural Historian

*RE: Proposed Project at Eastern Washington University  
Martin Williamson Hall  
Integrus Project No. 22282*

Mr. Abrahamson:

This letter is to notify you of a proposed project at Martin-Williamson Hall on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the college intends to submit a predesign for state review/approval of the project on June 30, 2024.

This project is proposed as a replacement of the existing Martin and Williamson Halls on the original building site. The building is proposed to be a three-story structure totaling ~124,400 gross square feet and will house the Psychology and Education Departments, Counseling/Wellness Services, and student support services/accommodations. A phased approach to construction will be utilized (over multiple biennia) as portions of the building will be occupied while under construction.

Throughout the years, both Martin and Williamson Halls have been renovated numerous times destroying the original historic character of the interior. However, the exterior façade retains a high level of integrity. This project proposes demolition of the existing floor plates which do not align with the needs of the Psychology and Education Departments while preserving two of Martin Hall's historic facades – the northeast and southeast elevations. This approach aligns most closely with EWU's institutional mission and overarching goals, the diverse needs for the academic and student service programs housed in the facility, as well as the state mandated building energy performance criteria.

The proposed construction will be located entirely on previously disturbed ground. Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving of an already existing drive for ADA parking and service access, and the addition of two ADA ramps will be installed at the main entry.

A site diagram illustrating this area of work is attached.

**RE: Proposed project at Eastern Wash University Martin Williamson Hall**

Mr. Miller,

Thank you for contacting the Tribe's Historic Preservation Office. We appreciate the opportunity to provide a cultural consult for your project, the intent of this process is to preserve and protect all cultural resources whenever protection is feasible.

After archive research of the project mentioned above, this project is all renovation work and other components therefore: I have no further concern on this project.

**RE:** This project will require an **inadvertent discovery plan of action** implemented into the scope of work.

This letter is your notification that your project has been cleared, and your project may move forward. As always, if any artifacts or human remains are found upon excavation, this office should be immediately notified and the work in the immediate area **cease**.

Should additional information become available, or scope of work change our assessment may be revised. Again, thank you for this opportunity to comment and consider this a positive action that will assist in protecting our shared heritage.

If questions arise, please contact me at (509) 258 – 4222.

Sincerely,

Randy Abrahamson

## 0.1 PROBLEM STATEMENT

**EWU's high-tech, hands-on engineering pedagogy has evolved beyond its existing substandard teaching laboratory facilities, originally designed to develop high school shop teachers. This lack of suitable space for contemporary engineering education also restricts EWU from offering a Civil Engineering program which would address the critical shortage of civil engineers across Washington State and leverage EWU's existing complementary strengths in geosciences and construction management.**

EWU's Department of Mechanical Engineering & Technology (MENT) offers rigorous and pragmatic Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Applied Technology, and Construction Management degrees that prioritize hands-on training and applied learning that lead to high-paying, non-gig jobs. EWU's engineering classes are taught by faculty with industry experience. The department is housed in the 30-year-old Computing and Education Building (CEB).

MENT graduates are highly sought after in the growing Spokane and West Plains mechanical engineering marketplace—in the most recent survey, 86% of MENT graduates were employed in a job related to their degree within a year of graduation. Regional civil engineering firms often hire students from both MENT and EWU's Geosciences department due to the state-wide lack of qualified graduates in civil engineering. Given EWU's existing strengths in MENT and geosciences and the strong demand for civil engineers, EWU would like to expand its hands-on, career-oriented engineering degrees to include Civil Engineering (CE).

The high-tech, hands-on laboratory training which makes up a significant portion of MENT education currently takes place in substandard spaces with serious deficiencies consistently documented in accreditation visits. These include student safety concerns due to poor instructor sightlines, reduced overhead clearances and limited overhead services which restrict evolution with changing machine technology, aging technological infrastructure, ADA accessibility concerns, and lack of student interaction spaces. Lack of suitable space also restricts both the hiring of additional MENT faculty and the development of a CE program. Finally, the existing inadequate space has severely limited engineering research and on-campus industry collaboration.

## 0.2 PROPOSED SOLUTION

**A new Engineering Building connected to the existing Computing and Engineering Building (CEB) is the best alternative to providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing Mechanical Engineering and Technology and prospective Civil Engineering programs.**

The 82,522 GSF building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas. 42,411 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The construction of the Engineering Building will allow MENT program growth and degree production and allow EWU to offer a CE degree program, with conservative forecasting showing enrollment increasing 76% in the first five years of building occupancy.

Enabling engineering enrollment growth at EWU will not only change students' lifelong potential but lead Washington State in solving some of the 21st century's biggest challenges.

### 0.3 PROJECT CONTEXT

#### State and Regional Context

Engineering is one of the top three STEM occupations in Washington State and the Northeast Washington region. State reports indicate a 65% gap in supply of engineering bachelor's degrees needed to meet workforce demand in Washington State in the next five years. All bachelors degrees and certificate programs offered by EWU's Engineering Department are designated STEM/High Demand by the State of Washington and prepare students for entry into cutting-edge engineering and related professions.

#### Institutional Context

EWU's mission is to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence.

EWU is in the implementation phase of a Strategic Resource Allocation project to better understand which programs (both academic and administrative) are thriving, which require additional support, and which should be eliminated or re-envisioned. From this analysis, engineering emerged as an area for further investment. EWU is also developing a strategic plan and examining its institutional branding and identity. An emerging theme of both efforts is a stronger institutional commitment to emphasize applied learning through serving the needs of the region.

The proposed Engineering Building will support EWU's mission by providing facilities which will encourage enrollment in high-demand degree programs, create spaces that foster inclusive practices, support community and prospective student outreach activities with rural and underserved populations, improve the quality and safety of laboratories, be a living laboratory for sustainability, fully inspire and support students' unique interests through degree completion, and encourage student engagement with each other, the engineering programs and the regional engineering industry.

#### Enrollment Growth

From 2010 through 2020, EWU's Mechanical Engineering and Technology program experienced strong and sustained enrollment growth. Rebuilding post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. The Engineering Department has built highly successful outreach programs to rural and underserved prospective student populations and continuation programs with community colleges, which have created a strong pipeline for future MENT & CE students. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 76% in the first four years of building occupancy.

## 0.4 SPACE NEEDS ASSESSMENT

The program requirements for the Engineering Building and renovation of CEB were developed with campus and engineering faculty and summarized below:

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |
| Offices & Office Support                         | 1,740         |
| Collaboration                                    | 7,180         |
| Total Engineering Building (ASF)                 | 45,387        |
| Estimated Net/Gross Ratio                        | 55%           |
| <b>Estimated Engineering Building Area (GSF)</b> | <b>82,522</b> |
| <b>CEB Renovated Spaces</b>                      |               |
| Teaching Labs                                    | 14,406        |
| Research Labs                                    | 2,863         |
| Classrooms                                       | 1,296         |
| Offices & Office Support                         | 8,809         |
| Collaboration                                    | 4,051         |
| Total CEB Renovated Space (ASF)                  | 31,425        |
| Estimated Net/Gross Ratio                        | 80%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>39,281</b> |
| <b>Cheney Hall Renovated Spaces</b>              |               |
| Teaching Labs                                    | 981           |
| Research Labs                                    | 1,836         |
| Total CEB Renovated Space (ASF)                  | 2,817         |
| Estimated Net/Gross Ratio                        | 90%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>3,130</b>  |

Ratio consistent with other science buildings

EWU aspires to at minimum achieve the mandatory LEED® Silver certification; higher certification levels and other methods to reduce greenhouse gas emissions will be explored in future phases.

## 0.5 ANALYSIS OF ALTERNATIVES

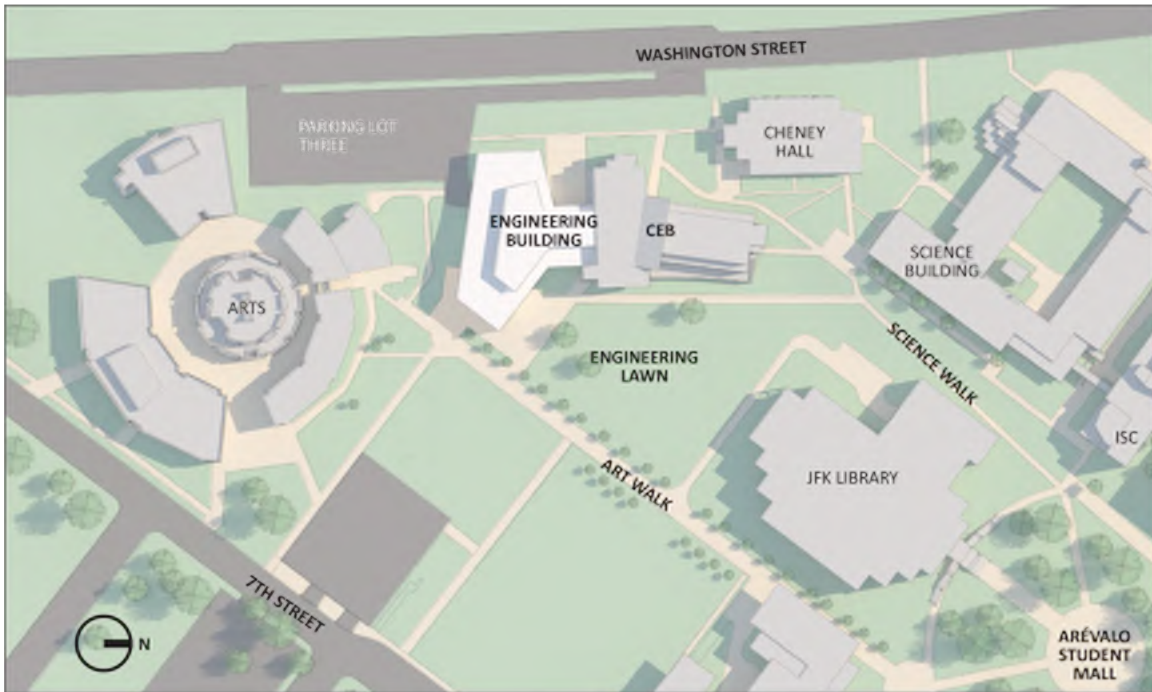

Three alternatives were considered for addressing the identified needs:

- No action
- Full renovation of the existing CEB and Cheney Hall facilities
- A new building on the existing campus connected to CEB

No action would maintain substandard, pedagogically inappropriate facilities and makes it impossible for EWU to offer new, high-demand STEM degree programs such as civil engineering. A full renovation of the existing CEB is not prudent given that most spaces are good condition for their intended use as classrooms, and the resulting laboratories would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.

## 0.6 SITE ANALYSIS

Five candidate sites on the Cheney campus were identified and evaluated to determine a preferred site for the a new Engineering Building. Key factors in the site selection were appropriate area available, proximity and possible connections to the existing CEB, increasing proximity to Washington Street for greater visibility to industry and community, connections to campus pedestrian and ADA circulation, and disruption to existing buildings and landscape. Topography, solar orientation, access to utilities, service access, parking impact, and future campus expansion were also considered.

EWU Engineering Building Site Plan

The site selected is Site C: Cadet Hall, which is located immediately south of the existing CEB and east of Washington Street. The site best meets the factors above and responds to EWU's 2014 Master Plan Goals of connecting to the larger community and enhancing open space. Another benefit is this site's proximity to the newly proposed all-electric geothermal heating and cooling plant that will service this building, removing it from the existing fossil fuel fired steam plant.

## 0.7 PREFERRED ALTERNATIVE

Satisfaction of the identified needs can best be achieved through construction of a new building on EWU's Cheney campus integrally connected to the adjacent existing CEB. The preferred alternative will provide existing and planned Engineering programs with the contemporary, hands-on, safe teaching laboratories they need to flexibly serve existing and future engineering degrees. The new facilities will increase faculty and industry research opportunities, support community and prospective student outreach, and encourage student engagement with each other, the Engineering programs and the regional engineering industry.

The preferred alternative will construct a new four-story, 82,522 GSF facility housing engineering teaching laboratories, research laboratories, lab support facilities, work areas, and student collaboration and study areas. Square footage in the new Engineering Building is reduced by taking advantage of CEB's strengths as a traditional classroom and office building; 39,281 GSF will be renovated where suitable for the project program. The direct connection with CEB takes advantage of offering many efficiencies such as shared departmental and instructional resources, direct access to faculty and administrative offices, shared student amenities, and reduced building envelope. 3,130 GSF of suitable space in nearby Cheney Hall will also be renovated to complete the project program.

The demolition of Cadet Hall is also included in the project scope. See Section 4.0 Site Analysis for more detailed discussion of Cadet Hall and relocation of its current program.

## 0.8 PROJECT SCHEDULE SUMMARY

|                                       |                               |
|---------------------------------------|-------------------------------|
| Predesign                             | March 2024 – June 2024        |
| Design                                | November 2025 – January 2027  |
| Building Permit                       | November 2026 – February 2027 |
| Bidding                               | March 2027 – June 2027        |
| Construction                          | July 2027 – February 2030     |
| Closeout & Commissioning              | March 2030 – May 2030         |
| Move In                               | June 2030 – July 2030         |
| Classes begin in Engineering Building | September 2030                |

## 0.9 BUDGET ANALYSIS

Escalated project costs for the Engineering Building are summarized as follows:

|                              |                      |
|------------------------------|----------------------|
| Acquisition Costs            | \$0                  |
| Consultant Services          | \$9,569,384          |
| Construction Contracts       | \$106,942,195        |
| Equipment                    | \$6,403,647          |
| Art Work                     | \$636,743            |
| Other Costs                  | \$0                  |
| Project Management           | \$4,433,304          |
| <b>Total Project Request</b> | <b>\$127,985,272</b> |

Detailed project costs have been submitted to OFM through the online Capital Budgeting System.

# 1.0 PROBLEM STATEMENT

---

- 1.1 PROBLEM STATEMENT
- 1.2 PROPOSED SOLUTION
- 1.3 STATE OF WASHINGTON CONTEXT
- 1.4 INSTITUTIONAL CONTEXT
- 1.5 OPERATIONAL CONTEXT
- 1.6 PROJECT HISTORY

## 1.1 PROBLEM STATEMENT

**EWU's high-tech, hands-on engineering pedagogy has evolved beyond its existing substandard teaching laboratory facilities, originally designed to develop high school shop teachers. This lack of suitable space for contemporary engineering education also restricts EWU from offering a Civil Engineering program which would address the critical shortage of civil engineers across Washington State and leverage EWU's existing complementary strengths in geosciences and construction management.**

EWU's Department of Mechanical Engineering & Technology (MENT) offers rigorous and pragmatic Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Applied Technology, and Construction Management degrees that prioritize hands-on training and applied learning that lead to high-paying, non-gig jobs. EWU's engineering classes are taught by faculty with industry experience. The department is housed in the 30-year-old Computing and Education Building (CEB).

MENT graduates are highly sought after in the growing Spokane and West Plains mechanical engineering marketplace—in the most recent survey, 86% of MENT graduates were employed in a job related to their degree within a year of graduation. Regional civil engineering firms often hire students from both MENT and EWU's Geosciences department due to the state-wide lack of qualified graduates in civil engineering. Given EWU's existing strengths in MENT and geosciences and the strong demand for civil engineers, EWU would like to expand its hands-on, career-oriented engineering degrees to include Civil Engineering (CE).

The high-tech, hands-on laboratory training which makes up a significant portion of MENT education currently takes place in substandard spaces with serious deficiencies consistently documented in accreditation visits. These include student safety concerns due to poor instructor sightlines, reduced overhead clearances and limited overhead services which restrict evolution with changing machine technology, aging technological infrastructure, ADA accessibility concerns, and lack of student interaction spaces. Lack of suitable space also restricts both the hiring of additional MENT faculty and the development of a CE program. Finally, the existing inadequate space has severely limited engineering research and on-campus industry collaboration.

## 1.2 PROPOSED SOLUTION

**A new Engineering Building connected to the existing Computing and Engineering Building (CEB) is the best alternative to providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing Mechanical Engineering and Technology and prospective Civil Engineering programs.**

The 82,522 GSF building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas. 42,411 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The construction of the Engineering Building will allow MENT program growth and degree production and allow EWU to offer a CE degree program, with conservative forecasting showing enrollment increasing 76% in the first ten years of building occupancy.

Enabling engineering enrollment growth at EWU will not only change students' lifelong potential but lead Washington State in solving some of the 21st century's biggest challenges.

### 1.3 STATE OF WASHINGTON CONTEXT

#### Higher Education Objectives

The Education and Research Data Center [ERDC] of the Washington Office of Financial Management has identified engineering as a STEM/High Demand field. “A Skilled and Educated Workforce 2021-22” issued jointly by the Washington Student Achievement Council, the State Board for Community and Technical Colleges and the Workforce Training and Education Coordinating Board forecasts a **65% gap in supply of engineering bachelor’s degrees** needed to meet workforce demand in Washington State in the next five years. All bachelors engineering degrees awarded by EWU apply toward filling this gap.

Source: A Skilled and Dedicated Workforce 2021-22

The same report notes that **demand for civil engineers tops the list** of the number of annual openings in top engineering jobs at a bachelor’s level. The 2023 WSAC HELM Report notes that civil engineering is and is predicted to continue to be one Washington State’s top twelve occupations for at least the next ten years at a bachelor’s and above level. 2023 WA Employment Security data predicts that **mechanical engineers ranks in the top three** in demand in engineering jobs. The Mechanical Engineering and Technology (MENT) and prospective Civil Engineering (CE) programs offered by EWU are focused on training graduates who can serve these regional needs.

Source: WA Employment Security, 2023

## **EWU Engineering Degree Production**

EWU's engineering programs are focused on educating students who seek degrees in STEM, high demand engineering professions. From 2010 through 2020, EWU's MENT program experienced strong and sustained enrollment growth. As described further in Section 1.3 Operational Context, rebuilding growth post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 53% in the first ten years of building occupancy.

### **1.4 INSTITUTIONAL CONTEXT**

EWU is in the implementation phase of a Strategic Resource Allocation project to better understand which programs (both academic and administrative) are thriving, which require additional support, and which should be eliminated or re-envisioned. From this analysis, **engineering emerged as an area for further investment.** EWU is also developing a strategic plan and examining its institutional branding and identity. An emerging theme of both efforts is a stronger institutional commitment to emphasize applied learning through serving the needs of the region. In Spring 2024, EWU adopted a revised Mission, Vision, and Statement of Values for the university.

#### **EWU's Mission & Vision:**

The proposed Engineering Building will support EWU's mission and vision by providing facilities which will encourage enrollment, support community and prospective student outreach activities with rural and underserved populations, improve the quality and safety of laboratories, and encourage student engagement with each other, the engineering programs and the regional engineering industry.

EWU Mission: Eastern Washington University provides an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence.

EWU Vision: Eastern Washington University provides an education rooted in the liberal arts, designed to address the unique challenges and opportunities facing the region. Characterized by a student-centered focus and opportunities for applied learning in high demand fields, this education creates upward social mobility and intellectual growth for our students that supports a healthy, sustainable, and economically successful region.

EWU MENT student in the Robotics Lab

## EWU's Strategic Plan

EWU's developing strategic plan (2024-2029) will be supported by the Engineering Building as described below:

| EWU Strategic Plan Pillars  | Engineering Building's Role In Pillars   |
|---|--|
| <p><b>Accessibility.</b> Eastern Washington University strives to create a more inclusive, obtainable, and equitable college education.</p>   | <p>The Engineering Building will increase access to high demand degrees and provide critical space for community engagement with prospective rural and underserved students.</p>   |
| <p><b>Academic Excellence.</b> As a community of learners, we pursue truth and advance knowledge through creative works, research, and scholarship. Our student-centered education provides excellent teaching, dynamic conversations, and a robust intellectual experience both inside and outside the classroom. We provide applied learning opportunities to prepare students for future success, invest in our workforce and create opportunities for professional growth for students, faculty, and staff.</p> | <p>The Engineering Building's contemporary, hands-on teaching laboratories and collaboration spaces will support innovative instruction and exchange of ideas. Increased enrollment through a contemporary facility that celebrates applied learning will allow the department to add a civil engineering degree and graduate programs which will result in additional FTE faculty hires.</p>  |
| <p><b>Belonging through Justice, Equity, Diversity and Inclusion.</b> We are committed to building an inclusive, supportive, and equitable university community. We strive to integrate the principles of justice, equity, diversity, and inclusion into all university operations, fostering an environment that nurtures a sense of belonging among all members of the community. Students, staff, and faculty are seen, understood, and appreciated for the talents they bring to our educational community.</p> | <p>The Engineering Building will be a place to practice inclusive practices through the hands-on nature of the teaching laboratories, the transparency into student project laboratories, ample space to assemble and display student work, and visible spaces for team collaboration and student clubs. A central space for internal and outreach events and celebrations welcomes and invites students and faculty to participate in the larger engineering community.</p> |
| <p><b>Regional Impact and Regional Contribution.</b> We promote economic vitality and regional success through scholarly research, dedicated service, and educational programs that meet regional workforce needs in high demand fields. When combined with our commitment to a liberal arts education, we enhance social mobility, inclusivity, and the well-being of our community while remaining nimble to its ever-changing demands.</p>   | <p>Not only will the Engineering Building contribute meaningfully to the regional engineering workforce demand through increased enrollment, it will increase student and faculty interaction with the cutting-edge mechanical and civil engineering industries in the region through contemporary research laboratories and flexible space for departmental outreach.</p>   |
| <p><b>Student Success.</b> We embrace all students. Students' needs are complex, and student success requires student engagement and positive outcomes. We are committed to supporting all our students with a focus on creating conditions informed by the needs of our first-generation, low-income, and other structurally marginalized students</p>   | <p>The Engineering Building will be a student-centered environment. Its high quality, hands-on teaching and project laboratories, flexible work areas and student interaction spaces will inspire and fully support their unique engineering interests and ideas through degree completion.</p>  |
| <p><b>Sustainability.</b> We are leaders committed to sustainability as a balance between the needs of the environment, the needs of the economy, and equitable outcomes for current and future generations.</p>  | <p>The Engineering Building will be a living laboratory for sustainable facility design, with building systems on display for faculty and students. A civil engineering program helps to sustain the local economy and infrastructure.</p>   |

## EWU's Master Plan

In 2014, the university updated the Cheney Campus Comprehensive Master Plan. In Horizon 1 (2013 to 2023) 1.4.5, the plan states: *Construct addition to the Computer and Engineering Sciences Building.* EWU's planning process integrates comprehensive campus planning with its facilities master plan and ten-year capital plan. This process provides short and long-range planning that is thoughtful and targeted but still dynamic and flexible enough to meet current and future campus needs.

The Master Plan describes five planning principles which the Engineering Building follows:

- *Carefully evaluate each project with regard to renovation vs. replacement opportunities*  
See Section 3.0 for renovation vs. replacement studies.
- *Locate and size all new or replacement buildings to optimize site utilization*  
See Section 4.0 for site optimization studies.
- *Improve the overall character of the campus with the implementation of each project*  
The Engineering Building will have two front doors to engage students on campus at the Engineering Lawn and the regional community on Washington Street. It will be visible from the southeast corner of Arévalo Student Mall at the entry to the Art Walk.
- *Create and follow a framework that welcomes EWU's neighbors and accommodates future campus expansion beyond existing boundaries*  
The building has been intentionally sited on Washington Street to present a new, dynamic front door for the Engineering Department and EWU that is highly visible and accessible to the surrounding community. Space for community outreach programs and events will be located just inside the Washington entrance.
- *Reinforce and improve the overall cohesion of campus, specifically linkages across Washington Street, whenever possible*  
Extending the Engineering Building to the East from Washington Street introduces a strong edge to the existing Engineering Lawn, complementing the edge created by JFK Library. The Engineering Building's student entrance on the Engineering Lawn and a new pathway to this entrance from Science Walk will further activate the Engineering Lawn. The building will improve and the pedestrian experiences of the Art Walk and 7th Street.

Engineering Building Site Plan: Dual Orientation Toward Washington & the Engineering Lawn

### **Background**

The Computing and Engineering Building (CEB) was built as a traditional classroom and office building in 2005 to house the then intertwined departments of computer science and engineering. In the years since, the disciplines have grown into three distinct departments, each of which has seen dramatic growth in employer demand for bachelor degree graduates.

Since their creation, the disciplines have also seen significant shifts in the greater Spokane region. The regional computer science industry has grown and consolidated in the Spokane City Center and mechanical engineering has taken center stage as Spokane and West Plains mechanical engineering companies have emerged as major players in their markets. EWU has been a long-time leader in regional bachelor degree production for the engineering disciplines; the Computer Science BS was accredited in 1986, the Mechanical Engineering Technology BS in 1990, the Electrical Engineering BS in 2005, and the Mechanical Engineering BS in 2011.

To reflect these regional shifts and to keep up with demand for graduates, EWU's Computer Science and Electrical Engineering programs relocated to EWU's Catalyst Building in downtown Spokane in fall 2020, allowing engineering facilities on EWU's Cheney campus to focus on the Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Construction Management, and Technology degree programs.

### **Mechanical Engineering and Technology**

EWU's Department of Mechanical Engineering and Technology (MENT) offers rigorous and pragmatic degrees that prioritize hands-on training and applied learning. The majority of students are enrolled in Mechanical Engineering, Mechanical Engineering Technology, Applied Technology, Construction Management Technology, and Manufacturing Technology. The majority of faculty in MENT have extensive industry experience. Majors in the MENT department make up approximately 5.5% of EWU's total undergraduate enrollment, while majors in all of the engineering and computer science disciplines constitute approximately 12.5% of the total undergraduate enrollment.

A unique aspect of EWU's engineering programs is that the robotics and automation curricula are housed within MENT, rather than the more conventional home in Electrical Engineering. This gives an inherently more interdisciplinary approach to training students with an interest in moving directly to the workforce. By training students with a mechanical engineering background how to program and operate industrial robots and Programmable Logic Controllers (PLCs), EWU's

EWU MENT student in the Robotics Lab

MENT graduates enter the workforce with an unusually holistic understanding of advanced manufacturing processes. MENT students combine experience programming an industrial robot or manufacturing line with a deep understanding of the physical systems themselves (e.g. manipulators, grippers, material strength, etc). The curriculum is built specifically to address the needs of regional industry that focuses on advanced manufacturing, large scale mechanics, and heavy industry robotics. EWU's degree programs involve classroom, laboratory and project work that results in graduates who have not only learned about mechanical engineering, they know how to apply it.

The MENT department at EWU strives to ensure that students graduate with a resume not just a diploma. Career placement data demonstrates that EWU's MENT graduates are sought after in the marketplace. A 2019 survey of recent MENT graduates showed that 86% of MENT alumni report that they are employed full or part-time in the year following graduation, with most students employed within the first six months after graduation. This number has held steady over more recent years. 55% of the ME and MET respondents also reported salaries over \$60,000 *in their first year*.

### **New Degrees**

Introducing a Civil Engineering degree has been a long-time goal of EWU. The university has made this top priority as the region continues to forecast high demand for civil engineers into the next decade. EWU's plan is to differentiate its approach to Civil Engineering by leveraging the breadth of disciplines represented in the College of STEM, ranging from the natural sciences to the engineering fields. In addition to the robust Mechanical Engineering program and workforce-oriented Construction Management degree, EWU has a Geoscience department with historical strengths in geotechnical engineering, GIS, and remote sensing. Planning for EWU's Civil Engineering degree is a collaborative initiative of MENT and Geosciences. The planned program will emphasize energy-efficient infrastructure, "green" building design and construction, sustainable infrastructure development, low-impact development techniques, and sustainable materials.

To meet the increasing need for specialized and advanced training in industry, EWU also plans to expand its graduate curriculum to include programs such as a Masters degrees in Mechanical Engineering and Civil Engineering. It will be impossible to introduce these additional programs and degrees in the future without quality teaching and research laboratory spaces.

EWU MENT teaching lab facilities with substandard overhead clearances in the CEB basement

## Existing Facilities

EWU's engineering programs had their roots in an earlier program primarily focused on training high school Career and Technical Education teachers (e.g. shop, graphic design, and electrician teachers). EWU began to transition these programs to true engineering degrees in the late 1990s; the new engineering programs were still in their infancy when CEB was constructed in 2005. The basement of CEB, where the primary MENT teaching labs are located, was programmed and built to reflect those early needs and philosophy. The engineering programs have changed dramatically since that time, now producing Mechanical Engineering and Mechanical Engineering Technology graduates prepared for cutting-edge jobs at engineering and advanced manufacturing companies throughout the region.

While moving Computer Science to Spokane resulted in some vacant computer laboratories in CEB, these spaces are not suitable for the majority of MENT or CE teaching laboratories due to their minimal mechanical, electrical and plumbing services and overhead clearances. The basement of CEB contains the only spaces in the building with the mechanical, plumbing and electrical capabilities required for the hands-on materials and machine laboratory training which makes up a significant portion of MENT education. As noted previously, the basement of CEB is cramped and dark; not an inspiring place to spend two to four years earning a degree.

EWU MENT large student projects workspace & storage in loading door pathway

While there has not been certification difficulty to date, accreditors consistently cite strong concerns regarding capacity and safety issues in the existing CEB engineering laboratories. A primary concern of both faculty and accreditors is student safety due to poor sightlines in these spaces. Overhead clearances do not allow the relocation and addition of certain equipment, and overhead services are minimal resulting in space that is inflexible to the constantly evolving requirements of the field.

The lack of flexible, interdisciplinary collaboration spaces will also make future degree certification challenging. Students must complete a team capstone project to graduate. There is limited space for student teams to meet to develop their projects, so students work in circulation zones or amidst laboratory machine areas, adding to safety concerns. These projects are often physically large and need to be located near hand-on laboratory spaces during their production. The very limited storage space in the CEB basement is not only insufficient for the current number of capstone projects but nonexistent for large projects which results in them being stored in teaching laboratories or circulation zones which, in turn, become even more crowded and unsafe.

In 2006, several rooms in nearby Cheney Hall were renovated to provide additional labs required by the Electrical Engineering program. Further details on the existing facilities in CEB and Cheney Hall can be found in Section 2 of this report.

### Enrollment Forecast

From 2010 through 2020, EWU’s MENT program experienced strong and sustained enrollment growth, so much so that the Department capped enrollment in 2018-2019 due to lack of facility capacity. The pandemic further depressed EWU’s engineering enrollment. Since Covid, the engineering programs have continued their strong outreach programs to rural and underserved

prospective student populations by providing hands-on engineering activities which have historically directly correlated with subsequent enrollment at EWU and in engineering degrees. MENT in particular has built and maintained strong continuation programs with community college programs to move related Associate in Arts degrees holders (AA) into engineering bachelor’s degrees at EWU. Each year, the College of STEM organizes one of the biggest STEM-focused career fairs in Washington State.

EWU MENT students in the Metallics Lab in the basement of CEB

However, in the post-Covid environment, prospective students also need to see that they'll be inspired during the process of earning a degree, and the prospect of spending two to four years in the existing cramped, dark MENT facilities in the basement of CEB does the opposite. ***A facility which forefronts MENT and CE work, including daylit hands-on laboratories and adequate student project space will encourage prospective students to see themselves at EWU and to see their success after graduation.***

Rebuilding post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 76% in the first four years of building occupancy.

### Industry Involvement & Research

EWU's Department of Mechanical Engineering & Technology has a long history of strong relationships with the regional manufacturing industry including internships, company tours, career preparedness, guest lectures and instruction, on-campus interviews and engagement events. The current facilities can no longer accommodate the increased attendance at popular events such as capstone project demonstrations and the career fair, which must be held elsewhere on campus reducing the impact of the engineering experience for prospective students and industry partners. During on-campus job interviews, students are often interviewed in groups due to lack of suitable spaces.

A department goal is to provide opportunities for students and industry partners to interact and work together in active, hands-on engineering settings at EWU. The department has provided on-campus testing and product development support to industry partners in the past, but cannot provide these capabilities currently due to limited facilities. Companies have donated major robotics equipment in the past but the department has recently declined state-of-the-art robotics equipment donations due to lack of suitable facilities. Similar donations from mechanical engineering companies are restricted by the lack of suitable facilities.

|                    | Responses | Percent |
|--------------------|-----------|---------|
| Soft Skills        | 25        | 20%     |
| Commercial Drivers | 7         | 6%      |
| Machinery          | 7         | 6%      |
| Sales              | 6         | 5%      |
| Skilled Trades     | 6         | 5%      |
| Welders            | 6         | 5%      |
| Total Responses    | 124       |         |
| <i>n=124</i>       |           |         |

Source: Washington State Regional Educational Needs Assessment 2017

The Department works closely with S3R3 (West Plains/Airport Area Public Development Authority) which states that “the West Plains Airport Area is a globally recognized innovation zone with advanced manufacturing and aerospace industry clusters.” Access to an educated workforce is critical to prospective companies and EWU's Department of Mechanical Engineering & Technology is a major contributor to building advanced manufacturing technology industries in the region.

There is strong interest by current faculty and industry in strengthening mechanical engineering and advanced manufacturing research capabilities at EWU. Given the limited existing laboratory space appropriate for hands-on engineering work and the priority to educate and graduate

students, engineering research has been severely limited and will continue to be limited without dedicated research space. An increase in faculty due to an increase in enrollment will increase the demand for research space.

### **Student Collaboration & Community Building**

The Washington State Regional Educational Needs Assessment 2017 states that “a repeated concern of local employers was the lack of soft skills among new and potential employees.” EWU’s Department of Mechanical Engineering & Technology is committed to developing graduates who not only have technical knowledge and the ability to apply it, but also have real world skills such as leadership, teamwork, and communication to succeed in their careers.

Unfortunately the current facilities do not have the student interaction and faculty-student interaction spaces to encourage the types of interpersonal interactions that develop these skills. Capstone projects are team based but there are no meeting spaces for student teams to gather in. Commuters comprise the majority of EWU students but there is limited space for students to study and interact in the current facilities.

There are limited informal meeting spaces for faculty to interact with individuals and teams of students outside of class. There is only one large meeting room in CEB. Departmental community-building events are now often too large to be held at CEB and must be held elsewhere on campus.

Student clubs have limited to no space to work or meet. For example, the SAE Baja Club has access to a small space in Cheney Hall which they share with non-engineering student clubs and the Rocketry Club borrows space in the capstone projects lab. The department expects that enrollment in these and other applied engineering clubs would increase significantly given appropriate space with greater visibility to other students.

### **Community Outreach**

Learning how to talk about their work with non-engineers is seen as a critical skill for EWU Engineering graduates, and the department supports that through community and industry outreach programs and events which the students are expected to participate in.

As noted in the Enrollment Forecast section, the Department of Mechanical Engineering & Technology has built successful outreach programs to rural and underserved prospective student populations by providing hands-on engineering activities, events and clubs with the community. It would be most impactful to host these events in the engineering facilities to inspire prospective students to visualize an inspiring college engineering experience, but the department currently cannot house these events due to the space constraints and safety concerns described earlier, and so most outreach is mobile.

## 1.6 PROJECT HISTORY

The predesign process began in 2020 with a predesign process and report centered around providing pedagogically-appropriate space for the MENT program through a series of stakeholder work sessions including administrators, faculty and staff from the College of STEM, engineering faculty and staff, EWU Facilities & Planning and LMN Architects. The report was completed at the start of the pandemic at which point University priorities shifted in response.

Four years later, new facilities for Engineering and the development of a Civil Engineering program remain on EWU's 10-year plan. The 2024 predesign report process included stakeholder work sessions with a similar range of participants which resulted in revisions to the project program space list, organizational relationships, and space use strategies which reflect the operational context described above.

# **2.0 SPACE NEEDS ASSESSMENT**

---

**2.1 ASSUMPTIONS AND GUIDELINES**

**2.2 EXISTING FACILITIES**

**2.3 SPACE NEEDS ASSESSMENT**

**2.4 SPACE REQUIREMENTS**

**2.5 TECHNICAL PROGRAM REQUIREMENTS**

**2.6 FUTURE REQUIREMENTS**

**2.7 CODES/REGULATIONS**

## 2.1 ASSUMPTIONS AND GUIDELINES

Programming is the phase in which the project needs are defined, goals are identified and initial budget information is developed. It forms the foundation upon which all subsequent design work is based. The following assumptions were utilized in forming the program requirements:

- The current MENT pedagogy and prospective CE degree require contemporary teaching laboratories, in particular hands-on laboratories with adequate space and systems.
- Each engineering major must complete a capstone project in order to graduate which require project laboratories and projects storage spaces appropriate to those projects.
- Heavy teamwork and the fact that the majority of EWU students are commuters requires adequate student interaction spaces, in particular meeting rooms, study spaces, lounge spaces, and community areas.
- The department's continued success in prospective student outreach warrant interaction spaces for open houses, MESA activities, and other community projects which are critical to achieving EWU's mission and vision.
- The department's continued success in collaboration with local industry warrants interaction spaces for industry job fairs, interviews and collaboration.
- Current faculty interest in dedicated research space is strong, and projected enrollment increases will allow the hiring of new FTE faculty with similar aspirations

### Programming Standards

EWU considers a variety of space standards when planning and designing facilities described on the following pages in this section. EWU primarily relies on the design team's careful analysis of the activities and current pedagogical standards required by the specific occupants of a facility. For the Engineering Building, EWU selected LMN Architects, a national leader in higher education architectural design, and Research Facilities Design (RFD), a national laboratory planner with extensive experience designing engineering teaching laboratories. With EWU, the LMN/RFD team has proposed laboratories, classrooms and interaction spaces based on current industry standards. This process and standards are described in this section.

FEPG: Even though existing space planning references such as the Facilities Evaluation and Planning Guide 1994 (FEPG) and the Postsecondary Education Facilities Inventory and Classification Manual 2006 (FICM) are dated and do not accurately reflect the current needs and trends in higher education, they do hold some value as a rough benchmark and EWU uses them as such. The table below shows that the program for the Engineering Building and renovated CEB and Cheney Hall meet the FEPB standards. Note that FEPG Appendix A provides a wide range of lab station sizes for mechanical engineering labs.

| FEPG room classification number | FEPG room classification type      | Project ASF per station | FEPG standard         | Meets standard (Y/N) | Comments  |
|---------------------------------|------------------------------------|-------------------------|-----------------------|----------------------|---|
| 110                             | Classroom                          | 20                      | 16-26                 | Y                    |   |
| 210                             | Class lab – mechanical engineering | 76-290                  | 175<br>(Range 35-180) | Y/N                  | Varies based on engineering equipment sizes; see FEPG Standards Appendix A; Woodshop, Metallics, Additive Manuf, Construction Materials and Concrete Labs require significant additional ASF/Station for large equipment and safe working clearances. |
| 215                             | Class lab – services               |                         |                       | N/A                  | Sized appropriately to class lab needs  |
| 230                             | Computer lab                       | 44                      | 60                    | N                    | Falls below FEPG Guidelines but meets programming need  |
| 250                             | Research lab                       |                         |                       | N/A                  | Sized for research program needs  |
| 255                             | Research lab – service             |                         |                       | N/A                  | Sized appropriately to research lab needs   |
| 311                             | Faculty office                     | 140                     | 140                   | Y                    |   |
| 313                             | Student assistants                 | 70 per 1                | 140 per 2 min.        | Y                    |   |
| 314                             | Clerical office                    | 140                     | 140                   | Y                    |   |
| 316 & 317                       | Staff & other office               | 113                     | 120                   | Y                    | Below standards appropriate for visiting Advising staff   |
| 350                             | Conference room                    | 30                      | 20                    | N                    | Sized to allow program flexibility and storage needs  |
| 550                             | Demonstration                      |                         |                       | N/A                  | Sized appropriately for departmental needs  |
| 651                             | Nonpublic lounge                   |                         |                       | N/A                  | Sized appropriately for departmental needs  |
| 680                             | Meeting room                       |                         |                       | N/A                  | Sized appropriately for departmental needs  |

Efficiency of Space Allocation in the Engineering Building per FEPG 1994 Standards

Laboratory Module: To provide a baseline planning module for programming of teaching and research laboratories, a standard laboratory module was established by Research Facilities Design (RFD) based on industry standards and applicability to the types of laboratories included in the Engineering Building project.

The proposed laboratory planning module for the building was derived by analyzing the laboratory bench, equipment, and circulation space required for the engineering functions.

The module is based on the bench space required for technical work stations, instruments, and procedures. The space required between benches is designed to allow people to work back-to-back at adjacent benches, to allow for accessibility for disabled and still allow for movement of people and laboratory carts in the aisle.

The preliminary planning module utilized for the Engineering Building is 11'-0" wide by 33'-0" deep = 363 Assignable Square Feet. This module will provide adequate bench space plus space for floor standing equipment and fume hoods, and can be divided for smaller support spaces such as storage or instrument rooms.

Class and Research Laboratories: Preliminary areas for teaching and research laboratories were assigned based on benchmarks developed by RFD from similar university laboratory facilities, reviews of sizes of existing and proposed engineering equipment required in each lab, and on discussions with the faculty, staff and administration. Areas were rounded to the nearest laboratory module. Room diagrams for each proposed laboratory can be found in the Appendix of this report.

Classrooms: One classroom is included in the project scope as the result of reprogramming existing spaces in CEB. In order to create a physical connection to the Engineering Building on the Second Floor, two classrooms will be combined into one larger classroom.

Laboratory Service: The program size of lab support spaces was based on a comparison of existing spaces to identified needs.

Office and Staff Space: Renovations to office and staff space are intended to reduce average square footage to better align with current EWU office space standards.

## 2.2 EXISTING FACILITIES DEFICIENCIES

Two facilities currently house the engineering programs at EWU: the Computing and Engineering Building (CEB) and Cheney Hall. CEB houses the majority of the engineering program.

As noted in more detail under Existing Facilities in the Problem Statement section, CEB was designed in 2005 as primarily a classroom, computer lab and office building. Only the basement of CEB has the mechanical, electrical and plumbing systems suitable for the hands-on material and machine training which makes up a significant portion of MENT and CE education. In 2006, several rooms in nearby Cheney Hall were renovated to provide additional labs required by the electrical engineering program.

The existing facilities have serious pedagogical deficiencies which have been noted by accreditors and which are at odds with the university's mission to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence. Deficiencies in the existing buildings include:

### **Pedagogical Deficiencies in the Computer Engineer Building (CEB)**

Teaching Lab Safety Deficiencies: The existing MENT program has made use of every square inch of the CEB basement, which contains the only facilities suitable for hands-on shop laboratories. In many cases due to space constraints in CEB, multiple laboratory classes that would normally be held in separate teaching laboratory facilities are being taught in the same space. This has resulted in significant safety issues noted by both faculty and accreditors due to overcrowding and confinement. The awkward shapes of existing spaces do not allow instructors to have sightlines to all laboratory participants which is critical to student safety.

Teaching Lab Technical Deficiencies: The basement of CEB is the only facility with the mechanical, electrical and plumbing systems suitable for the existing MENT and prospective CE programs. However, across the entire CEB basement, overhead clearances are minimal and do not allow the relocation and addition of certain equipment. Overhead electrical services are also minimal resulting in space that is inflexible to the constantly evolving requirements of the field. Current laboratories do not have the vibration isolation and sound insulation that is required for high level experiments and research.

Teaching Lab Logistical Deficiencies: Mechanical and civil engineering laboratories are heavy consumers of bulky materials such as metals, woods and plastics which are delivered frequently. The main loading dock is on the first floor of CEB and the current freight elevator opens directly into a primary hands-on teaching lab (metallics) in the basement. All materials must be brought through that lab to other labs adding further safety and security concerns. Interior HVAC ductwork blocks the top three-four feet of the only basement loading door (which also happens to be in the Metallics Lab), rendering it almost useless for oversized deliveries, equipment access, or tall student projects. Metals deliveries arrive on semi-trucks, but exterior loading space in front of this basement door can only accommodate small delivery vehicles.

### **Pedagogical Deficiencies in Cheney Hall**

Technological Deficiencies: The existing Cheney Hall building is unsuitable for today's educational technology. Data infrastructure—including wired and wireless connectivity—are lacking, as are appropriate audio-visual and data facilities. The building's primary and secondary electrical system are original (1967) and do not allow for the equipment associated with today's instruction delivery, particularly MENT and CE which use specialized computer software which require robust computers dedicated to those programs.

Accessibility Deficiencies: Cheney Hall does not meet current ADA requirements and can be restrictive to students with mobility issues.

Interaction Space Deficiencies: Cheney Hall completely lacks the non-classroom spaces that enable t“a robust intellectual experience both inside and outside the classroom” envisioned in the university’s values. Spaces for informal student gathering, walk-in computer labs, lounges, collaboration, and study are currently non-existent. There are no spaces for informal and non-instructional interactions.

Building Systems Deficiencies: Cheney Hall’s heating, ventilation, and air conditioning systems are of original design and installation. Systems do not meet current energy code and indoor air quality issues are prevalent in the facility. This facility’s systems shortcomings have a substantial effect on instruction in the classrooms and laboratory spaces.

### **Building Conditions Deficiencies**

Please see Appendix for the FCS reports for Cheney Hall, CEB and Cadet Hall.

Systems Deficiencies: Systems in both Cheney Hall and CEB are connected to the existing campus fossil fuel generated steam system, which does not align with Washington State’s or the campus’ decarbonization goals.

Cheney Hall Building Conditions Deficiencies: Cheney Hall was originally completed in 1966 to house the Industrial Arts program. The building is 50 years old. There have been some minor renovations of the building in 2006 and 2016. The balance of the shell and space is of original construction and condition. **The Overall Facility Condition Score for the building is 2.6.** Many of the components are in the Fair-Systems Approaching End of Expected Life Cycles with some at critical level of Needs Improvement;

Limited Functionality.

- Substructure : 2.0
- Shell : 2.3
- The substructure and the shell of the building rank in the category of “good.” The roof and windows on the facility are original installation and do not meet current state energy code. The exterior walls and roof are not insulated and affect the utility cost of heating and cooling the building.
- Interiors: 2.8
- Most the interior walls, floors and ceiling are “worn” due to age with ceiling ranking 4 or “poor”.
- Services: 3.0

The systems of the building are what show the most decline. While the Plumbing and Electrical are in the “fair” range, the HVAC and Fire Protection components are at the level of 4 and 5 “poor” equipment marginal or “unsatisfactory” system non-functioning or seriously deficient. The building HVAC system does not meet current Washington State energy code and there are reported indoor air quality issues that can only be address by a new ventilation system. The building has many Americans with Disability Act (ADA) deficits due to the age and the original design. In particular, the elevator does not meet ADA requirements for current square foot or controls location.

Computing and Engineering Building Conditions Deficiencies: CEB was completed in 2005 and soon thereafter lacked any expansion space for program growth. The 2016 Facility Condition Assessment ranks the condition of the facility as “good/excellent” with an **overall 1.6 Facility**

**Condition Score.** Though CEB's condition score is good, the only space appropriate for the existing MENT and prospective CE programs is in the basement, and that space is substandard for today's high-tech, hands-on engineering learning environments.

### 2.3 SPACE NEEDS ASSESSMENT

After right-sizing existing program, analyzing existing space proficiencies and deficiencies, and accounting for enrollment growth with a contemporary facility and new CE program, the Engineering Department is currently deficient in:

- Instructional laboratory spaces for high-tech, hands-on applied learning
- Specialized laboratory spaces for faculty, graduate student and industry research
- Specialized laboratory spaces for student clubs and outreach activities
- Flexible open work space with exterior access for project and class extension
- Break-out laboratory classroom with sufficient space for engineering demonstrations
- Meeting rooms for student-student and student-teacher interactions
- Student study spaces and lounge
- Community space suitable for department and community outreach events

#### **Open Work & Community Space (Work Area/Lobby/Demonstration Space)**

Open work and community space, the fourth and final bullets above, are currently lacking in CEB and are critical to the success of the Engineering Department. The two functions can share space and are programmed as "Work Area/Lobby/Demonstration". Below are some of the planned uses of this space:

- Double height space with direct access to the outdoors, that can be used for both project work and demonstration, is required for student success. Student projects in MENT and CE can be physically large, occasionally up to ten feet tall. The department does not currently have space to support these projects which has forced them to be housed in inappropriate locations such as labs, and it has also had the unfortunate effect of limiting students' project choices and solutions.
- To support the large number of first generation and transfer students, the department has a tradition of holding capstone events for each of the four degrees and other industry interactive events every quarter. The department's annual STEM-focused career fair is one of the largest in Washington State. No space exists in the current facilities to support these activities at the size of the current department or with increased enrollment.
- An important part of the culture and success of the Engineering Program has been repeated interaction with a wide range of industry partners. The relationships built as part of those interactions generate private support, scholarships, equipment donations, collaborative projects and research opportunities. Space for these interactive events will allow expansion of these relationships. One departmental goal is to be able to serve as a resource to engineering societies in the region to hold events in collaboration with the University.
- Frequent events with many people and objects in this space are anticipated. To accommodate these, the scale of the space both horizontally and vertically must relate to the scale of the event and must also not limit the potential of large or non-stationary student capstone projects.

## 2.4 SPACE REQUIREMENTS

### Program Room List

The program for the Engineering Building project is separated into two primary sections:

1. Engineering Building
2. CEB Renovated Spaces
3. Cheney Hall Renovated Spaces

The following tables compile the spaces that are required by the Engineering Building project program as assignable square footages.

| ENGINEERING BUILDING                  |                                    |      |       |      |               |
|---------------------------------------|------------------------------------|------|-------|------|---------------|
| SPACE ID                              | SPACE NAME                         | OCC. | ASF   | QTY. | TOTAL ASF     |
| <b>TEACHING LABS</b>                  |                                    |      |       |      |               |
| 1.01                                  | Woodshop                           | 16   | 2,904 | 1    | 2,904         |
| 1.02                                  | Metallics and Foundry              | 22   | 4,538 | 1    | 4,538         |
| 1.03                                  | HVAC                               | 8    | 1,452 | 1    | 1,452         |
| 1.04                                  | Fluid Power                        | 24   | 1,815 | 1    | 1,815         |
| 1.05                                  | Construction                       | 12   | 1,815 | 1    | 1,815         |
| 1.06                                  | Construction Engineering           | 8    | 1,452 | 1    | 1,452         |
| 1.07                                  | Transportation & Pavement          | 8    | 1,452 | 1    | 1,452         |
| 1.08                                  | Environmental Engineering          | 8    | 1,452 | 1    | 1,452         |
| 1.09                                  | Fluids/Water Resources Engineering | 8    | 1,452 | 1    | 1,452         |
| 1.10                                  | Concrete                           | 5    | 1,452 | 1    | 1,452         |

### Room List Summary & Net/Gross Ratio

The table below summarizes the preceding room lists and adds an industry standard net/gross ratio to achieve the total building area.

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |
| Offices & Office Support                         | 1,740         |
| Collaboration                                    | 7,180         |
| Total Engineering Building (ASF)                 | 45,387        |
| Estimated Net/Gross Ratio                        | 55%           |
| <b>Estimated Engineering Building Area (GSF)</b> | <b>82,522</b> |
| <b>CEB Renovated Spaces</b>                      |               |
| Teaching Labs                                    | 14,406        |
| Research Labs                                    | 2,863         |
| Classrooms                                       | 1,296         |
| Offices & Office Support                         | 8,809         |
| Collaboration                                    | 4,051         |
| Total CEB Renovated Space (ASF)                  | 31,425        |
| Estimated Net/Gross Ratio                        | 80%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>39,281</b> |
| <b>Cheney Hall Renovated Spaces</b>              |               |
| Teaching Labs                                    | 981           |
| Research Labs                                    | 1,836         |
| Total CEB Renovated Space (ASF)                  | 2,817         |
| Estimated Net/Gross Ratio                        | 90%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>3,130</b>  |

Ratio consistent with other science buildings

## Relationships of Functions

The ideal relationships of teaching, project and research labs to each other was explored in multiple work sessions with the faculty, staff and administration. The process revealed that there were certain labs which have many preferred adjacencies and others which have few or none.

### Preferred Adjacencies

- Wood Shop, Metallics and Plastics are to be adjacent or proximate to each other
- Construction Lab is to be adjacent to Wood Shop
- Additive Manufacturing and Composites are to be proximate to Wood Shop, Metallics and Plastics
- Classroom Laboratory serves and is to be proximate to Wood Shop, Metallics and Plastics
- Work Area should be adjacent to Wood Shop, Metallics and Project Labs
- Project Labs are to be proximate to Wood Shop, Metallics and Plastics
- Project Labs and Project Storage are to be adjacent or proximate to each other
- Student Meeting Rooms (Team Rooms) are to be proximate to Project Labs, Wood Shop, Metallics and Plastics
- Club Lab should be proximate to Wood Shop, Metallics and Plastics
- Club Lab and Maker Space are to be proximate to the building entrance for outreach use
- Concrete Lab and Concrete Testing Lab are to be adjacent or proximate to each other

### Other Considerations

- Metallics would prefer a raised loading dock for semi-truck direct access into the lab
- Industry Space and Wood Shop prefer to direct loading into the labs
- Freight elevator is to be easily accessed from Wood Shop, Metallics, Plastics, Project Labs and Work Area
- Concrete Lab and Concrete Testing Lab should have direct access to the exterior

## Organizational Concept

Multiple organizational concepts for the Engineering Building were explored with the faculty, staff and administration. The diagram below shows the preferred concept which places students and their projects at its core, surrounded and supported by the labs and spaces that are most vital to enabling students' long term success.

Engineering Building Organizational Concept

## 2.5 TECHNICAL PROGRAM REQUIREMENTS

### Laboratory Room Diagrams and Data Sheets

Detailed preliminary laboratory room diagrams and data sheets are included in the Appendix. These documents provide the detailed program requirements for each type of laboratory space within the Engineering Building project and help to validate the program size for each.

### Building Systems Requirements

Building systems requirements are outlined in the description of major systems included in the Project Budget Analysis section of this report.

### Circulation

Effective circulation will be an important element in the design of the Engineering Building. Beyond the human occupants of the building, materials will be delivered to the facility including wood, metals, plastics and other supplies, and equipment. In addition to material delivery, the debris and waste generated by laboratory functions must be safely removed on a periodic basis.

Internal building circulation should provide safe pedestrian egress from each individual laboratory and laboratory support space through an uncomplicated path of egress to the building exterior at grade. Features that should be considered in the design of the circulation system include:

- At least one door into each laboratory space should have a minimum 54" wide clear opening. This can be accomplished using openings with one 3'-0" active leaf and one 1'-6" inactive leaf.
- Equipment lists should be carefully reviewed to verify that individual pieces of equipment can be transported and maneuvered between spaces. Future equipment should be anticipated.
- Doorways accessing corridors should open into recessed alcoves serving the corridor. The doors should swing out from laboratories, in the direction of exit.
- Wherever possible, circulation and fume hood locations within laboratory spaces should be coordinated to preclude exiting in front of the fume hoods.
- Clear, unobstructed access to the freight elevator from all labs for movement of materials, equipment and student projects is critical to the functioning of the program.

### Interaction

The program should include areas outside of laboratories that provide opportunities for students to study and interact with one another. The majority of EWU students are commuters, so it is vital that new facilities incorporate study spaces and lounge space as well as enhanced technologies to support virtual study.

The building should encourage interaction within each laboratory group, between students, researchers, and faculty, and with the larger campus. This requires that spaces that support interaction be created between laboratories, on each floor, and in public areas of building. Areas for formal and, in particular, informal interaction should be linked to the circulation schemes. Formal interaction spaces should include meeting rooms and lounge areas. Informal interaction spaces should include student study areas, casual meeting spaces for short duration interaction, display/announcement boards, and possibly outdoor gathering spaces.

Meeting rooms (programmed as "Team Rooms") should be incorporated throughout the building that facilitate groups of 4-6 students or groups of 12 for students plus faculty. These are the typical sizes of capstone project groups and engineering study groups.

## **Accessibility**

The principles of universal design should be entirely incorporated to provide an accessible environment to all of its users throughout both the building and the site. Ramps and grading should allow easy access to the building from campus buildings and parking. All spaces within the building should incorporate the ADA guidelines to allow for an easily accessible environment for all of the building occupants. Early consideration should be given to the following accessibility aspects:

- Accessible work stations and fume hoods should be provided in the laboratories based on code requirements.
- Location of accessible work stations should be as close as possible to eyewashes and safety showers.
- An 18" clearance on the pull side and 12" clearance on the push side of doors opposite the hinged side is required.

Some guidelines for accessible work stations in laboratories include:

- Work surfaces 30" - 34" above floor with wheelchair clearance below. Adjustable work surfaces can provide a range of possible height adjustments.
- Laboratory service controls, equipment, and equipment controls within easy reach for persons with limited mobility. Controls should have single-action levers or blade handles for easy operation.
- Aisle widths and clearances adequate for maneuvers of wheelchair bound individuals. Aisles 5'-0" wide are recommended with turnaround areas.

## **Vibration Control**

Some of the engineering equipment that will be used in the Engineering Building is sensitive to vibration, and some equipment creates excessive vibration. The building structure should be designed to moderate vibration to acceptable levels. Care should be taken to locate vibration creating engineering equipment where it has the least impact on other laboratories. Labs and support spaces will be designed to satisfy floor vibration criteria of VC-A (2,000 micro-in/sec. at 75 steps/min). This vibration criteria is appropriate for optical balances and microscopes up to 400x magnification, which are common in many labs. Classroom and office areas will be designed to meet the standard criteria of 0.5% g (g = force of gravity).

Air handling equipment and ductwork should be designed to minimize vibration. Supply and exhaust air fans, compressors, pumps and other noise and vibration producing equipment should be located in mechanical rooms with protective wall and floor construction. Equipment shall be isolated from supporting structure with resilient mounts. Vibration isolators should be selected based on floor stiffness, span extension, equipment power and operating speed.

## **Building Management Systems**

The Engineering Building should be provided with a micro-processor based direct digital control building automation/energy management system. This system should provide environmental and energy management controls in all spaces and monitoring of the laboratory controls. All data from the energy management system should report into the existing campus energy management control system to allow for reporting of space and system status, reporting of alarms, scheduling of preventative maintenance functions, and trending of data for energy conservation purposes.

Monitoring of critical parameters of the ventilation system will be important for safe operation and effective maintenance and management of the building. Status of HVAC operations for laboratories, fume hoods, and other critical spaces, should be reported and alarmed when outside of established operational criteria.

Besides providing a high level of control and functionality in an integrated building control system, it is also desirable to have the capability of remote data reporting on consumption gas, potable domestic water, domestic hot water, low temperature heating water, chilled water, steam, building electrical service, 208V and 460V HVAC equipment (fans, pumps, and other equipment) electrical energy use, lighting electrical energy use, electric vehicle charging energy use, plug load energy use, and on-site renewable energy generation as required by the energy code and for use by the engineering courses.

### **Technology Infrastructure**

Spaces in the new engineering building should be flexibly designed to support changing technologies and dynamic laboratory environments. Teaching laboratories should feature the latest technological tools to support teaching goals and engineering demonstrations. Technology infrastructure should be designed to meet the current needs of each lab space, while remaining flexible enough to accommodate future potential changes to lab equipment and lab functions. All labs are to have overhead services. Wireless Internet access should be provided throughout the building.

## **2.6 FUTURE REQUIREMENTS**

### **Design to Adapt to Changes**

Planning a building that can adapt to change is particularly important and challenging when designing engineering buildings because they both need to keep up with technological advancement in the field and are laden with significant scientific and safety equipment. The design of an engineering facility also commences so far in advance of actual construction that the design team must emphasize flexibility in all aspects of the project to accommodate potential pedagogical shifts. Measures to accommodate change may include:

- Planning the structural layout such that partitions can easily be deconstructed or relocated to create larger or smaller spaces as needed.
- Providing adequate floor to floor heights to accommodate future increases in ventilation requirements due to future unforeseen equipment needs.
- Avoiding the use of systems that are difficult to modify or work with.
- Selection of building systems that require little and easy maintenance and are easily accessible and adaptable.
- Selection of moveable furniture and equipment that can be easily stored.

# **3.0 ANALYSIS OF ALTERNATIVES**

---

## **3.1 DESCRIPTIONS OF ALTERNATIVES**

## **3.2 SUMMARY OF ALTERNATIVES**

## **3.3 LIFE CYCLE COST OF ALTERNATIVES**

### 3.1 DESCRIPTIONS OF ALTERNATIVES

#### **Alternative I: Preferred Alternate - New Engineering Building on the Existing Campus**

Satisfaction of the program requirements can readily be achieved through construction of a new building on the Cheney campus providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing MENT and prospective CE programs. It will improve the quality and safety of laboratories, increase faculty research opportunities, support community and prospective student outreach activities, and encourage student engagement with each other and the regional engineering industry.

The new structure will be designed to provide desired health, safety and functionality without compromise. The new building will connect to CEB, taking advantage of CEB's strengths, creating efficiencies such as shared departmental and instructional resources, direct access to faculty and administrative offices, and shared student amenities. The building will be a student centered environment that provides a high quality engineering teaching and research environment that is responsive to the needs of engineering education and the engineering industry.

#### **Alternative II: Renovation of Existing Engineering Facilities**

An alternative for addressing the deficiencies of the existing facilities would be a major renovation of CEB and Cheney Hall. The alternative falls short in serious ways: it is not only similar in cost to a new building, it results in substandard teaching and research laboratories and continued operational and systems inefficiencies, and it eliminates eight good quality, general use classrooms and two computer labs. Additional costs would be incurred to relocate the entire Engineering Department and others from both buildings during construction.

CEB was completed in 2005, is currently in good condition for its primary purpose as a classroom, computer lab and office building. However, the existing structure and systems of CEB are not compatible with the needs of engineering education. The ventilation demands and laboratory support systems in a engineering facility require above-average floor-to-floor heights that allow clear ceiling space for large duct work and laboratory plumbing and electrical systems. The existing CEB mechanical, engineering and plumbing systems are suited only for office, classroom and computer lab space. They are not adequate for engineering and cannot be made so without substantial demolition and reconstruction of the superstructure. Resulting labs would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.

Cheney Hall was completed in 1966 and many of the components are approaching end of expected life cycles. It currently houses a portion of the athletics department and swing space for the sciences. Both buildings do not meet current ADA, structural and energy codes.

#### **Alternative III: No Action**

The consequences of taking no action would be a negative impact on EWU students, the engineering programs, the University, the region, and the State. No action would maintain substandard, pedagogically inappropriate facilities and makes it impossible for EWU to offer new, high-demand STEM degree programs such as civil engineering. Student success in EWU's engineering programs could not be ensured. The result would be that EWU would not be able to produce more graduates in high demand engineering professions and this would undermine the policies of the Washington Student Achievement Council and the Office of Financial Management.

Additionally, the current Engineering Building would continue to have significant deficiencies in building systems, technology, student spaces and general quality. The current facilities would also continue to experience high maintenance and repair costs, which if deferred will result in facilities that are not capable of supporting even the current student load.

### 3.2 SUMMARY OF ALTERNATIVES

The following table compares the alternatives:

|                       | <b>Alternative I:<br/>Preferred Alternate</b> New Engineering Building on the Existing Campus   | <b>Alternative II:</b> Renovation of Existing Engineering Facilities   | <b>Alternative III:</b> No Action  |
|-----------------------|---|--|--|
| Description           | Design and construction of a new engineering building and targeted renovation of existing space in CEB and Cheney Hall to provide contemporary, pedagogically appropriate facilities.   | Major renovation to existing facilities, including both CEB and Cheney Hall to provide contemporary, pedagogically appropriate facilities for the engineering programs where suitable.   | No action taken.   |
| Advantages            | <ul style="list-style-type: none"> <li>- Provides sufficient high quality teaching laboratories to flexibly serve multiple degree programs over time.</li> <li>- Provides state-of-the-art engineering research facilities for faculty and industry collaboration</li> <li>- Direct connection to CEB takes advantage of CEB's strengths, creating efficiencies such as shared instructional resources, direct access to faculty and administrative offices, and shared student amenities.</li> </ul> | <ul style="list-style-type: none"> <li>- Reuses some of the existing infrastructure.</li> <li>- Cheney Hall is due for some systems and finishes upgrades.</li> <li>- No demolition of Cadet Hall or relocation of its program elsewhere on campus.</li> </ul>   | <ul style="list-style-type: none"> <li>- No demolition of Cadet Hall or relocation of its program elsewhere on campus.</li> </ul>  |
| Disadvantages         | <ul style="list-style-type: none"> <li>- Demolition of Cadet Hall and relocation of its program elsewhere on campus.</li> </ul>   | <ul style="list-style-type: none"> <li>- Majority of CEB's facilities are in good condition for their intended use as classrooms and offices.</li> <li>- Upgrading mechanical systems for lab use requires substantial demolition and reconstruction.</li> <li>- 8 good quality general use classrooms and 2 good quality computer labs in CEB would be eliminated.</li> <li>- Resulting labs would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.</li> <li>- Additional costs will be incurred to relocate occupants during construction.</li> </ul> | <ul style="list-style-type: none"> <li>- EWU's engineering programs would maintain substandard, pedagogically inappropriate facilities.</li> <li>- EWU will not be able to offer new, high-demand STEM degree programs such as civil engineering.</li> <li>- Student success in EWU's undergraduate engineering programs is not ensured.</li> <li>- EWU would not be able to produce more graduates in high demand engineering professions undermining the policies of the Washington Student Achievement Council and the Office of Financial Management.</li> </ul> |
| Project Costs         | \$127,985,272   | \$127,403,050  | \$0  |
| Construction Schedule | Start: July 2027<br>Midpoint: November 2028<br>Completion: February 2030  | Start: July 2027<br>Midpoint: December 2028<br>Completion: April 2030  | No Construction  |

See Financial Assumptions tab for more detailed information

COP Deferred and 63-20 Financing defer the payment on principle until construction completion.

**New Lease Assumptions**

Real Estate Transaction fees are 2.5% of the lease for the first 5 years and 1.25% for each year thereafter in the initial term of the lease.

Tenant Improvements are typically estimated at \$19 per rentable square foot.

IT infrastructure is typically estimated at \$1500 per person.

Furniture costs are typically estimated at \$7000 per person and do not include new workstations.

Moving Vendor and Supplies are typically estimated at \$300 per person.

**Default Ownership Options Assumptions**

Assumes a 2 month lease to move-in overlap period for outfitting building and relocation.

Assumes surface parking.

The floor plate of the construction option office building is 25,000 gross square feet.

The estimated total project cost for construction is \$506.63 per square foot.

See the Capital Construction Defaults tab for more construction assumptions.

# **4.0 SITE ANALYSIS**

---

**4.1 SITE OPTIONS**

**4.2 CAMPUS RELATIONS**

**4.3 SITE EVALUATION - PHYSICAL ISSUES**

**4.4 SITE EVALUATION - REGULATORY ISSUES**

**4.5 SITE EVALUATION - ACCESS ISSUES**

**4.6 SITE SELECTION**

#### 4.1 SITE OPTIONS

Five candidate sites on the Cheney campus were initially identified to determine a preferred site for the Engineering Building. The predesign process highlighted that locating the Engineering Building immediately adjacent to CEB for the purposes of sharing resources and encouraging interaction between engineering disciplines was very important. This intention remained intact through studies of several options for the location of the Engineering Building. Ultimately, three sites adjacent to CEB were selected as alternatives worth studying for the Engineering Building.

- Site A: Cheney Hall
- Site B: Cadet Hall
- Site C: Parking Lot 3
- Site D: Engineering Hall
- Site E: Reid Hall

Evaluation of all the sites included consideration of numerous issues and those are illustrated in the table on the next page. Key factors in the site selection were appropriate area available, proximity and possible connections to the existing CEB, increasing proximity to Washington Street for greater visibility to industry and community, connections to campus pedestrian and ADA circulation, and disruption to existing buildings and landscape. Topography, solar orientation, access to utilities, service access, disruption to existing parking and future campus expansion were also considered.

See 3.6 in this section for more detail on the three sites which were chosen for further study. Site A: Cheney Hall and Site C: Parking Lot 3 were studied because of their favorable campus locations and high criteria score. These sites were not chosen because their potential connections to CEB were less favorable. Cheney Hall would be challenging to demolish as it would interrupt other University programs which also share space in the building and because of possible future uses, such as swing space for other University facilities projects.

The predesign study concluded that Site B: Cadet Hall, which is located immediately south of the existing CEB and east of Washington Street, is the most appropriate site for the new engineering building. It best meets the criteria and responds to EWU's 2014 Master Plan Goals of connecting to the larger community and enhancing open space. It has the most favorable adjacency to CEB and its location allows for new "front doors" for Engineering on Washington Street and the Engineering Lawn. This site is located within the boundaries of the Eastern Washington University's Cheney campus and is owned by the State of Washington. The site contains adequate available area that a building on the site will comply with all easement and setback requirements set forth by the University.

Rating:  
'3' = Significant Advantage  
'0' = Significant Disadvantage  
Weighing Factor:  
'5' = Most Important  
'1' = Least important

| Evaluation Criteria                             | Site Options |              |           |              |           |               |           |                  |           |              |           |

| Connection to future development                | 2            | 3            | 6         | 3            | 6         | 1             | 2         | 3                | 6         | 2            | 4         |
| Impact of disruption to existing building(s)    | 2            | 0            | 0         | 2            | 4         | 3             | 6         | 3                | 6         | 3            | 6         |
| Utilities availability/rerouting                | 2            | 3            | 6         | 3            | 6         | 3             | 6         | 2                | 4         | 2            | 4         |
| Allows future engineering growth                | 2            | 0            | 0         | 2            | 4         | 1             | 2         | 1                | 2         | 3            | 6         |
| Disruption to existing parking                  | 1            | 2            | 2         | 0            | 0         | 0             | 0         | 3                | 3         | 3            | 3         |
| <b>Total</b>                                    |              |              | <b>88</b> |              | <b>93</b> |               | <b>87</b> |                  | <b>63</b> |              | <b>57</b> |

Please note that the scores under “Impact of Disruption to Existing Buildings” represents the relative disruption at a University level: disruption of Site A Cheney Hall will have far more impact at a University level than disruption of Sites B-E.

Cheney Hall (~30,000gsf) currently contains program for multiple departments, making the functions more difficult to replace. In the short and long term it is also considered good swing space, especially for the sciences given its existing lab amenities. Cadet Hall (~10,000gsf) currently contains non-technical program that could be housed in a variety of spaces on campus. See 4.3 in this section for further description of Cadet Hall.

## 4.2 CAMPUS RELATIONS

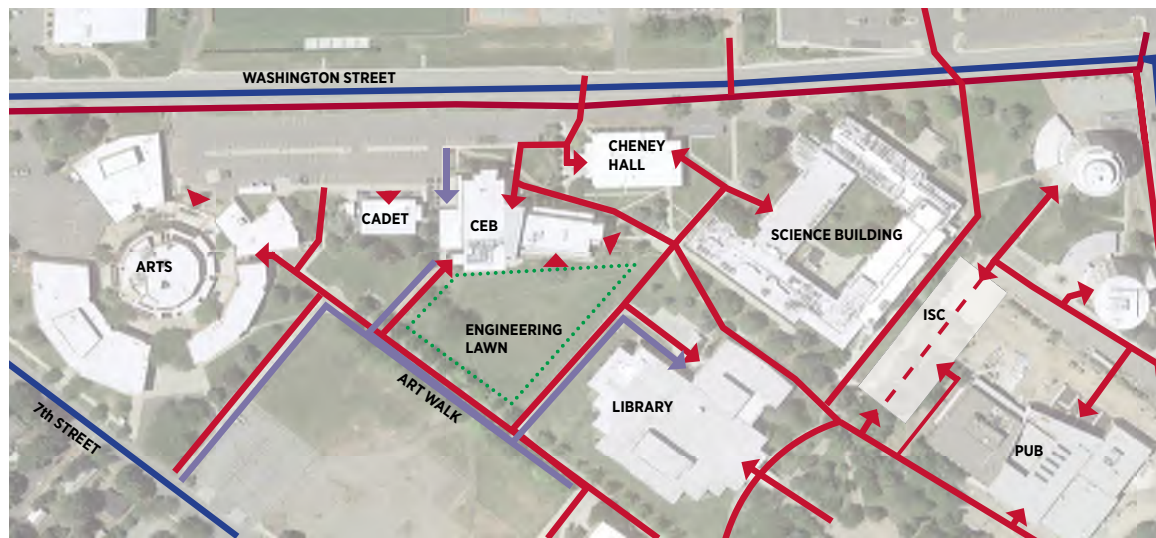

### Campus Organization

EWU's Cheney campus is currently organized around two major pedestrian circulation routes, the "Art Walk" and the "Campus Mall", and 2 major open spaces, the Campus Quad and the Engineering Lawn. The site options B, D and E are located adjacent to the main circulation route "Art Walk". The informal open lawn area adjacent to the Art Walk has been identified as the "Engineering Lawn".

### Campus Circulation and Open space

The major open spaces on campus each have a unique character that is beneficial for a diversity of uses. The Engineering Lawn area represents the largest open lawn area on the campus and is used by students for informal activities such as playing frisbee, however, the space lacks definition at the edges and is not fully integrated into campus life because of the lack of destinations around it. The major open spaces are supplemented by a large number of smaller open spaces, giving the campus a park-like feel.

The major campus circulation routes are supplemented by minor routes that link into the surrounding city grid. Building entries are generally grouped around open spaces and major pedestrian routes. There are no primary building entries to CEB currently fronting on the Engineering Lawn open space. Secondary entrances to CEB front the engineering lawn or the Science Building and are often used by students more than the primary CEB entrance which faces Washington Street.

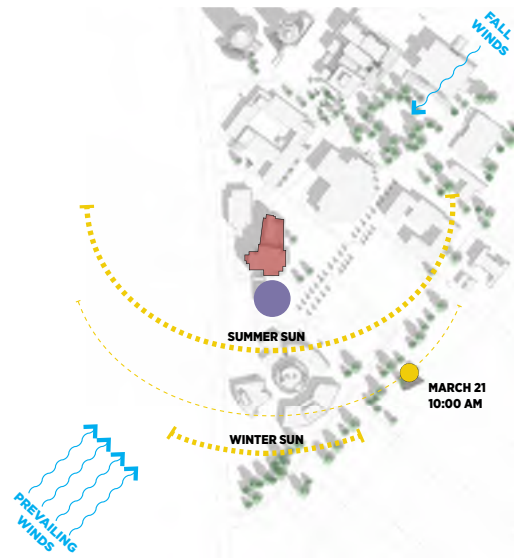

-  VEHICLE ACCESS
-  PEDESTRIAN ACCESS
-  SERVICE ACCESS
-  BUILDING ENTRANCE

Campus Circulation Diagram

### 4.3 SITE EVALUATION - PHYSICAL ISSUES

#### Climate/ Solar Orientation

The preferred site for the Engineering Building site will require access to daylight. To optimize solar exposure and reduce unwanted glare and heat-gain, the ideal site orientation for a building in this climate will require the building to be oriented in an east-west manner. The building will be designed to allow daylight to penetrate into the building for access to the public spaces and common areas, while the light in the labs will be controlled. Building fenestration will be designed with consideration to the overall site and building orientation. Any future nearby development should be kept to three stories to maintain solar access for the Engineering Building.

Preferred Engineering Building Site Solar and Wind Orientation

#### Water Rights & Availability

Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet. Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of the tap water, backflow assemblies are installed throughout the campus to protect the water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements.

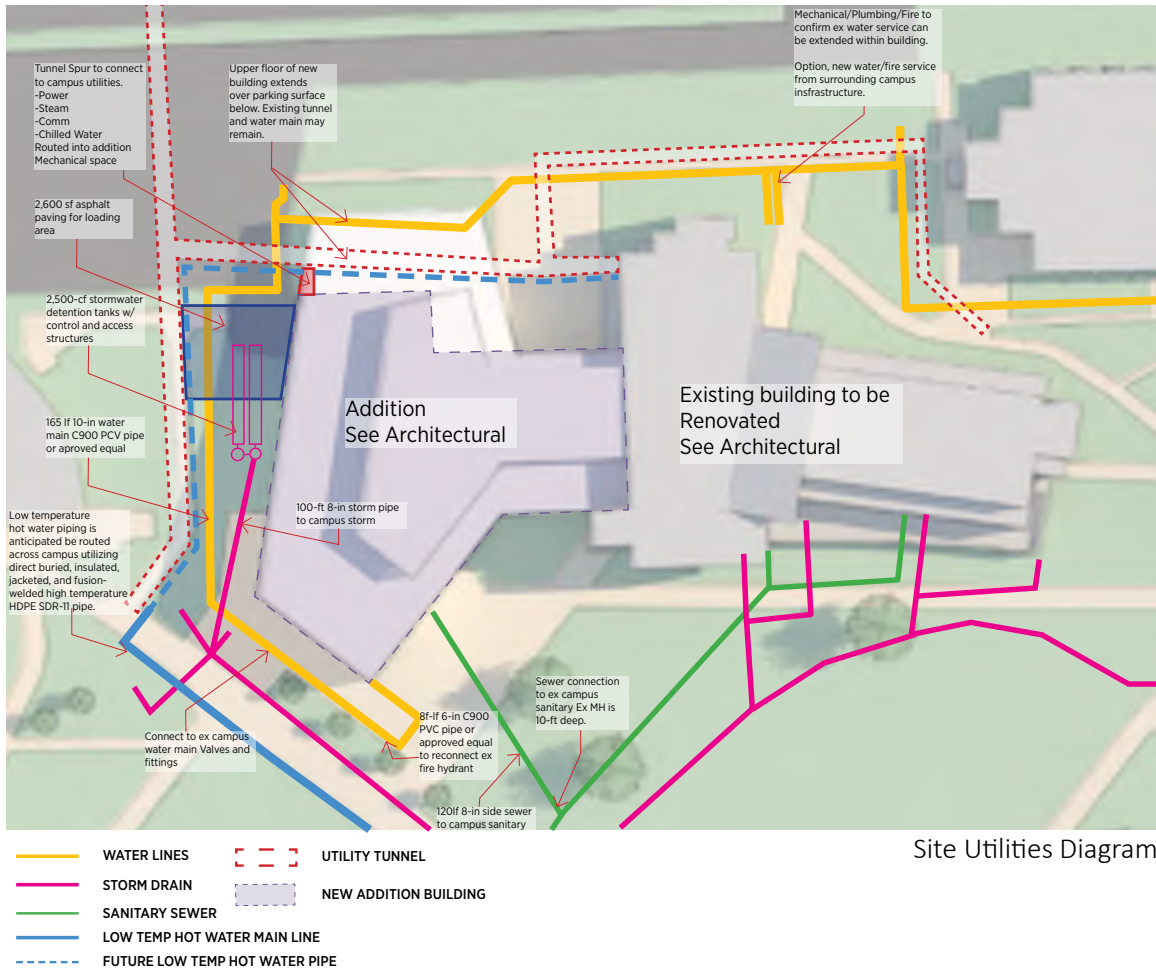

A report is submitted to the Department of Health each year. EWU's water meets or exceeds all standards set for quality and safety and is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

#### Stormwater Requirements

The University's stormwater system drains to the City of Cheney's street storm system, and this new engineering building will conform to the City's development manual which specifies stormwater design standards. Stormwater that runs off the vehicular service drives will be treated by a biofiltration swale system adjacent to the drive that will feed into a detention system.

#### Geotechnical and Environmental Conditions

Historical geotechnical reports for CEB and the JFK Library were reviewed in order to gain a

Site Utilities Diagram

preliminary understanding of subsurface conditions in the area of campus near the candidate sites. Those geotechnical reports show that subgrade soils are generally comprised of soft to medium stiff clayey soils underlain by basalt bedrock. Pilings or geopiers supported on the basalt bedrock are generally recommended for foundations. Perched groundwater is found at various depths, sometimes near the surface, and will likely require a building to be equipped with sub-floor and perimeter drainage with collected water pumped to a disposal system or to a cistern for reuse in landscape irrigation. Since a preliminary geotechnical report on the site is beyond the reach of this predesign study, it is not possible to conclude that any of the alternatives would provide superior foundation and/or drainage conditions.

### Utility Extension

The campus tunnel system runs beneath the preferred site and currently provides direct access to steam, chilled water, telecommunications and electricity to the project. Water, sanitary sewer, storm drainage, and natural gas are separate, direct-buried utilities and are accessible to all sites. Low temperature heating water will be generated by a new open-source ground coupled heat pump heating plant. The plant is being planned as a separate project. Low temperature hot water piping is anticipated be routed across campus utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.

### Energy Conservation

Factors that may affect energy conservation in any of the site alternatives are:

- Solar orientation, both for daylighting of interior spaces and laboratories
- Adjacency to the campus tunnel system, which would allow the use of centrally generated

- steam, chilled water, and direct buried low temperature heating water
- Consolidation of energy intensive lab/shop spaces into the new addition, whose processes require large amounts of fresh air and exhaust, will allow for sustainable, energy efficient solutions that cannot be accommodated within the existing facilities due to practical spatial restraints

### **Hazardous Materials Inventory**

Cadet Hall will be evaluated for hazardous materials and all abatement completed prior to the start of any demolition work.

### **Buildings Affected by Work**

The demolition of Cadet Hall (~10,000gsf) and related site work is also included in the project scope. Built in 1955, Cadet Hall has major infrastructure issues and, if retained, a major upgrade to this building infrastructure will be needed in the future. The building is one of the smaller buildings on campus and the building's size and current organization does not allow for other University uses in the long term. The Cadet Hall site is an excellent location on campus for campus growth.

The ROTC program currently occupies Cadet Hall. EWU's Facilities and Planning feels that it is more advantageous to move the ROTC program to a new location and keep the Engineering Building in close proximity to CEB. EWU Administration has been advised that the Cadet Hall site is a high priority location and relocation of the ROTC program has not currently been a concern given that there are adequate or better spaces to house them on campus. The functions of Cadet Hall could relocate to Cheney Hall in either the short or the long term. Cheney Hall will have immediate vacancies due to the current use as science swing space. Relocation of the existing ROTC program will be carefully managed by the university.

## **4.4 SITE EVALUATION - REGULATORY & NEIGHBORHOOD ISSUES**

### **Property Setback Requirements**

The project site is situated within the existing campus and faces Washington Street to the east. Washington Street is classified by WSDOT as a Major Collector. The project will adhere to the setbacks specified by the City of Cheney and the building separation requirements of the current building code.

### **Neighborhood**

No potential issues with the surrounding neighborhood during construction or ongoing are expected or have been identified.

### **Zoning and Local Requirements**

Zoning and local land use regulations are not expected to significantly affect the preferred site. The City of Cheney designates the campus of Eastern Washington University as a unique zone called "P" (Public). The Cheney Zoning Code has no specific restrictions on the use of property within a P zone.

### **Environmental Impacts**

All sites are compatible with SEPA and LEED® requirements. There are no known environmentally sensitive conditions. Wetlands, shorelines, flood zones, endangered species, and contaminated soils are not present at the site.

### **Building Code Requirements**

The International Building Code as amended by the State of Washington has been adopted by the

City of Cheney and will govern the design and construction of the Engineering Building. Building code requirements are not expected to rule out or have a profound impact on the use of any proposed alternatives.

### **Other Regulatory Requirements**

No other regulatory requirements are expected or have been identified.

## **4.5 SITE EVALUATION - PARKING & ACCESS ISSUES**

### **Parking**

No parking issues are expected or have been identified. Parking at EWU is provided on a campus wide basis, with assigned surface parking lots and on-street parking. Parking is not specifically provided for individual buildings. The Parking Lot 3 area adjacent to CEB will be effected by all options and the loss of parking stalls will be replaced with an increase of parking in the lot just off 7th Street. Accessible parking will need to be added adjacent to the building in all site options.

### **Construction Lay-Down**

No potential impact on surroundings and existing development with construction lay-down areas and construction phasing is expected or has been identified.

### **Pedestrian Access**

Pedestrian circulation should be concentrated around the Engineering Lawn and on the Art Walk to stay within and complement existing campus organization. Pedestrian access between CEB and the Engineering Building will be at the Engineering lawn as well as a connected internal corridor.

### **Service Access**

Service access to the site can be provided via the west of the building via Washington Street for Option A. Service access can be provided via the Art Walk for Option C and Option D. Service access to the site can be provided via both Washington Street and The Art Walk for Option B, the preferred alternative. Both routes are currently used to service other buildings on the campus. If access is provided via the Art Walk, the conflict between pedestrian circulation and service vehicles will be increased, however, the University feels this is manageable.

### **ADA Access**

Primary circulation routes around the Art Walk and Engineering Lawn are generally accessible due to the relatively flat topography. The primary exception to this occurs along the area to either side of CEB and around Cadet Hall. All the schemes bridge this section of topography and provide public entries at both an upper level and a ground floor level which facilitates wheelchair access to either elevation.

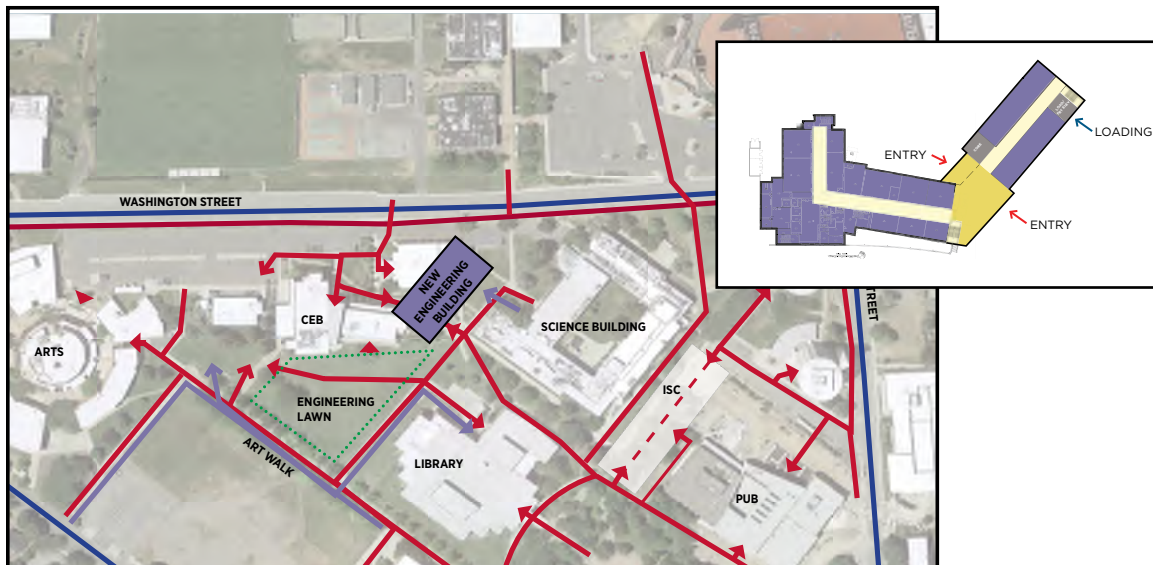

## 4.6 SITE SELECTION

Multiple potential site alternatives were studied for the location and layout of the Engineering Building. Based on a determination and evaluation of site selection criteria noted previously in this section, Sites A, B and C were selected to study in further detail. Each option evaluated the relationships of the building to the campus and to CEB. Key site relationships studied include:

- Proximity to CEB for pedestrian access and shared resources
- Proximity to Washington Street for greater visibility to industry and community
- Activation of the Engineering Lawn through proximity to CEB and the JFK Library
- Convenient service access for loading
- Future campus expansion
- Solar Orientation

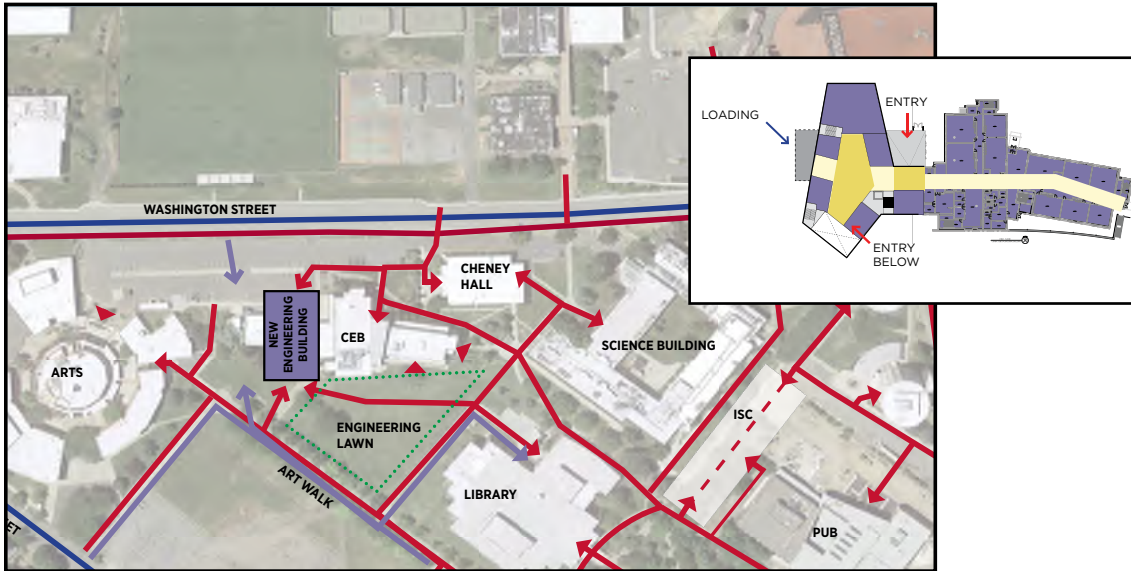

### Site A: Cheney Hall Replacement

This alternative replaces Cheney Hall and provides a direct connection to CEB along the northern stair tower and ties into the existing circulation pattern on campus. The north entrance of CEB, although not designed as the main entrance, is often used by students entering the building. This scheme would create a more successful entrance to CEB and combine it with the new entrance of the new building. It allows for loading to be shared with the Science Building. The basement of CEB could be utilized for mechanical space to limit the amount of square footage required in the

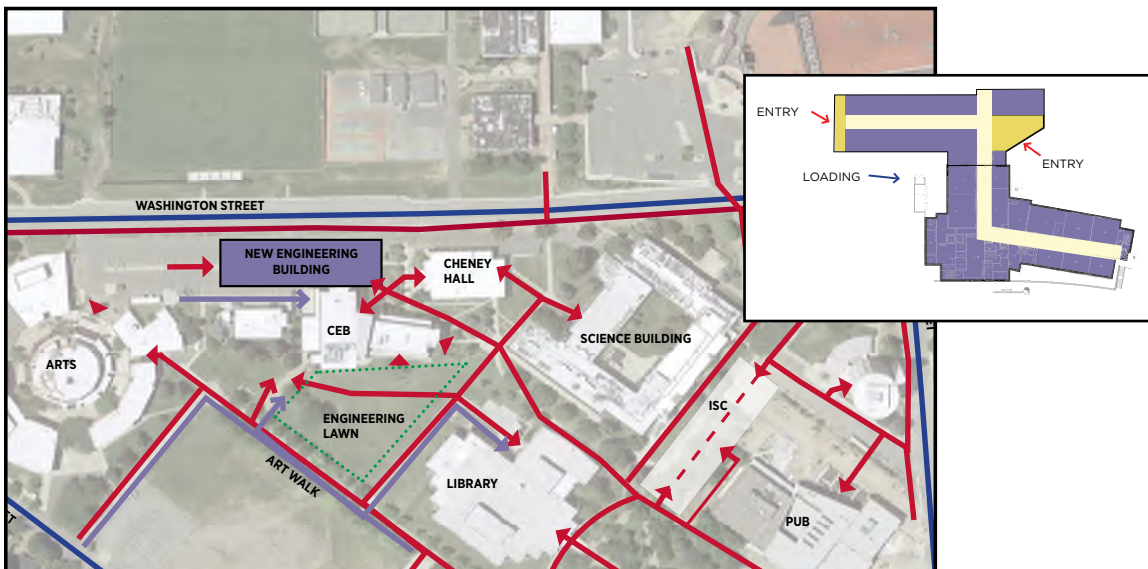

### Site B: Cadet Hall Replacement - Preferred Alternative

This scheme replaces Cadet Hall. It has both loading and entrances located towards campus at the ground level and towards Washington Street at level one. It creates two front doors and a presence to Washington street and to campus and the Art Walk. It is connected to CEB via the north/south corridor . The student entrance is facing the Art Walk and engineering lawn. This schemes east/west orientation allows for an optimal solar orientation.

### Site C: Parking Lot 3 Construction

This alternative replaces existing parking and provides a direct connection to CEB along the west stair tower and corridor. It creates a strong front door presence on Washington Street with the front facade elongated along Washington. It has a direct connection to CEB for shared resources and connection. It lacks a connection to the engineering lawn and the student entrance would be located adjacent to the CEB main entrance and Cheney Hall entrance.

This page intentionally left blank

# **5.0 PREFERRED ALTERNATIVE**

---

**5.1 NATURE OF SPACE**

**5.2 OCCUPANCY**

**5.3 PREFERRED ALTERNATIVE BUILDING CONFIGURATION & SQUARE FOOTAGE**

**5.4 SITE PLAN**

**5.5 LONG TERM PLANS**

**5.6 LAWS & REGULATIONS**

**5.7 PROBLEMS, COMPONENTS, TECHNOLOGY, SECURITY, COMMISSIONING**

## 5.1 NATURE OF SPACE & SQUARE FOOTAGE

The preferred alternative will construct a new three story, 82,523 GSF. Engineering Building connected to the existing Computing and Engineering Building (CEB). The building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas.

33,530 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The demolition of Cadet Hall is also included in the project scope. See Section 4.0 Site Analysis for more detailed discussion of Cadet Hall and relocation of its current program.

The program for the Preferred Alternative—a new Engineering Building combined with targeted renovations of CEB and Cheney Hall—was developed in conjunction with campus and Engineering Department leadership and is summarized in the following table. See Section 2.0 Space Needs Assessment for more detail.

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |
| Offices & Office Support                         | 1,740         |
| Collaboration                                    | 7,180         |
| Total Engineering Building (ASF)                 | 45,387        |
| Estimated Net/Gross Ratio                        | 55%           |
| <b>Estimated Engineering Building Area (GSF)</b> | <b>82,522</b> |
| <b>CEB Renovated Spaces</b>                      |               |
| Teaching Labs                                    | 14,406        |
| Research Labs                                    | 2,863         |
| Classrooms                                       | 1,296         |
| Offices & Office Support                         | 8,809         |
| Collaboration                                    | 4,051         |
| Total CEB Renovated Space (ASF)                  | 31,425        |
| Estimated Net/Gross Ratio                        | 80%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>39,281</b> |
| <b>Cheney Hall Renovated Spaces</b>              |               |
| Teaching Labs                                    | 981           |
| Research Labs                                    | 1,836         |
| Total CEB Renovated Space (ASF)                  | 2,817         |
| Estimated Net/Gross Ratio                        | 90%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>3,130</b>  |

Ratio consistent with other science buildings

## 5.2 OCCUPANCY

Total enrollment occupancy for the combined Engineering Building and renovated CEB and Cheney Hall project is 700 students. EWU's expectation is that this building under current growth forecasts for students and faculty would reach maximum capacity at about 15 years after opening. The objective will be to occupy and reach capacity as quickly as possible. EWU is continuously reviewing faculty hiring, enrollment data and projections, curriculum requirements, scheduling, class sizes, etc to identify a maximum enrollment capacity.

### 5.3 BUILDING CONFIGURATION

The below axonometric drawing illustrates the basic, four-story, configuration of programmed spaces in the preferred alternative. The project primarily consists of a new facility—to the left of the red line—that contains teaching laboratories, research laboratories, and collaborative working spaces. The new building has an integral connection to the existing Computing and Engineering Building (CEB)—to the right of the red line—some of which will be modified to complete the project program. See Project Drawings section for more detailed floor plans and 3d views.

Engineering Building

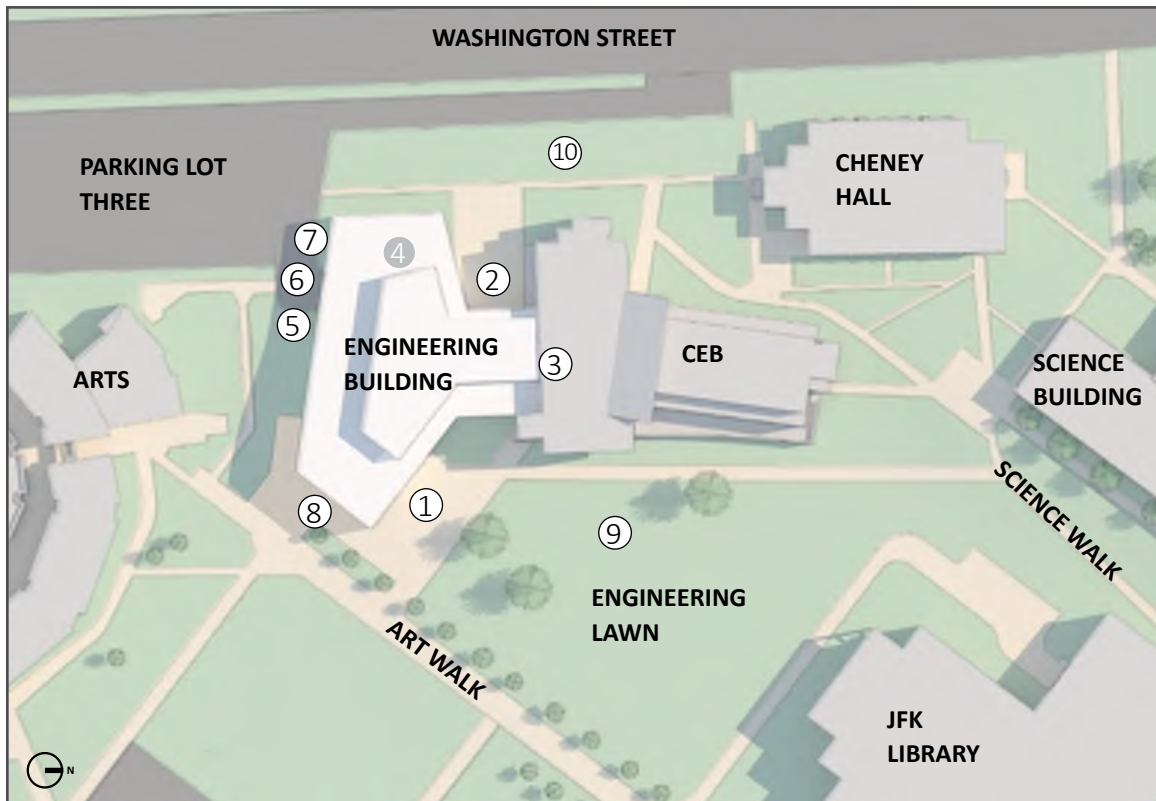

CEB

#### Engineering Program Legend

|                                |                      |                |                      |
|--------------------------------|----------------------|----------------|----------------------|
| Teaching Laboratories          | Classrooms           | Offices        | Building Support     |
| Research Laboratories          | Collaboration Spaces | Office Support | Not in project scope |
| Project Laboratories & Storage | Circulation          | Open Office    |                      |

## 5.4 SITE PLAN

### Site Features

- 1) Northwest Entrance Plaza- One of two primary building entries is located off the Art Walk and faces the Engineering Lawn.
- 2) Washington Entrance- One of two primary building entries provides access from Washington Street, off of Parking Lot Three.
- 3) Connection to CEB- Continuation of CEB's north-south circulation corridor into the building on Ground, First and Second Floors.
- 4) Utility Tunnel- A branch utility tunnel connects a partial mechanical basement with the existing campus utility tunnel that runs under the building.
- 5) Service Yard- Located adjacent to the parking lot, includes electrical equipment such as transformers, and trash/recycle;
- 6) Loading Dock- Access from Washington Street through Parking Lot Three;
- 7) Raised Direct Loading Doc- From Parking Lot Three into Metallics;
- 8) Direct Loading- From Art Walk into ground level Industry Space and Northwest Entrance.
- 9) Engineering Lawn- A new path from Science Walk past CEB to the building. Enlarged hardscape work area to the east of both buildings.
- 10) Bio Infiltration Swale- A vegetative system will hold stormwater and treat stormwater from the vehicular drive

## 5.5 LONG TERM PLANS

The project is consistent with applicable long-term plans as required by RCW 43.88.110 through EWU's 2014 Comprehensive Master Plan.

## 5.6 LAWS & REGULATIONS

### Sustainable Design

Sustainable strategies to reduce and enhance the project's impact on the environment and lower its energy demand will ultimately have a beneficial effect on its longevity and operational cost. Reusing and upgrading existing buildings is the most important greenhouse gas reduction strategy in the built environment, reducing air pollution, eliminating waste, and reducing the demand for new materials. There are numerous regulations and plans that point this project towards highly energy efficient and low-carbon building strategies listed below, along with many sustainability strategies that can be advanced in the next phase.

High Performance Buildings: Eastern Washington University has a proven track dating back to 2008 of designing and constructing high-performance buildings using the LEED rating system. This project will select design consultants who embody EWU's sustainability objectives. This project will be designed, constructed, and certified to the LEED Silver Standard, as a minimum, in accordance with RCW 39.35D. A LEED Checklist, outlining a preliminary approach to silver, has been included in the Appendix. EWU has had a history of achieving LEED silver or higher and will strive to achieve LEED gold or platinum on this project.

State Efficiency and Environmental Performance: The Governor's Executive Order 20-01 mandates high performance buildings for reduction of greenhouse gases, reduction of pollutants from fossil fuels, and the use of clean energy when technically and economically feasible. Eastern Washington University acknowledges that the costs of constructing zero energy or zero energy capable buildings are nearing parity with conventional buildings. Consequently, the university will further progress its building construction endeavors toward this directive, employing life-cycle cost analysis tools to inform decision-making throughout the design process. The life-cycle cost analysis performed as part of this predesign included the evaluation of a net zero building. In studying the use of photovoltaic (PV) solar panels for on-site renewable energy generation, the required area of PV panels exceeded the available roof area and would require additional dedicated site area. PV panels required by the Washington State Energy Code will be installed.

State Energy Standards for Clean Buildings: The Department of Commerce, through RCW 19.27A.210, has developed standards for reducing greenhouse gas emissions from the building sector as published in the Washington State Clean Buildings Performance Standard (2021). The Clean Building Performance Standard has established energy use intensity targets. This building is anticipated to exceed the 50,000 square feet threshold for Tier 1 Buildings, mandating compliance on the building level. EWU monitors their Energy Use Intensity (EUI) as a campus and has been evaluating their overall EUI in relation to the Washington State Clean Building Performance Standard, with a target campus EUI of 112.2. The preferred building option of this predesign is anticipated to reduce the entire campus' EUI from the current value of 118.4 closer to compliance with the Clean Building Performance Standard EUI requirement.

As of March 15, 2024, the 2021 Edition of the Washington State Energy Code has been implemented. Washington State Energy Codes are on a path towards 70% energy use reduction and the elimination of fossil fuels from buildings by 2031. With progressively more aggressive energy requirements, facilities will progress towards reducing energy consumption and associated greenhouse gas emissions, as outlined in the Greenhouse Gas Emissions Policy. The 2021 code

includes a requirement for photovoltaics panels on site. The project will be permitted under the code in effect at the time of permit which may be the 2021 codes or the 2024 codes, which are expected to be in effect November of 2026.

Required vehicle charging capabilities: Per RCW 19.27.540, where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

Greenhouse Gas Emissions Policy (RCW 70A.45.070): The referenced Revised Code of Washington regarding the greenhouse gas emissions reductions requires all state agencies to reduce greenhouse gas emissions as follows:

- i. By 2020 to 1990 levels.
- ii. By 2030 to forty-five percent below 1990 levels.
- iii. By 2040 to seventy percent below 1990 levels.
- iv. By 2050 to ninety-five percent below 1990 levels.

Eastern Washington University is committed to becoming a carbon neutral institution and a leader in sustainable practices. Part of the University's strategy to cut greenhouse gas emissions involves decreasing reliance on fossil fuels for building energy. The incorporation of energy-efficient HVAC, plumbing, and electrical systems in this proposed facility is crucial for advancing the campus's goal of reducing overall fossil fuel usage. Given that major capital projects are typically significant energy consumers, prioritizing energy efficiency in the new facility is particularly important.

This project is unique for EWU as it intends to utilize a new all electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers.

*Campus Decarbonization Plan & Climate Action Plan:* EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

EWU is also updating their Climate Action Plan (CAP), which will address how the University can achieve carbon neutrality over the next 30 years. While the CAP may not be complete in the short term, design teams should consider strategies to align with the goals of carbon neutrality in the next 30 years. The electricity grid in Washington will be carbon neutral beginning in 2030, meaning a high-performance, all-electric building will meet that goal.

*Campus Decarbonization Plan & Climate Action Plan:* Supporting these plans and compliance with HB 1390, this project intends to connect to a new GeoEco central plant that utilizes an efficient, all-electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers. The building will also serve students and faculty as a living lab of the low-carbon energy future that they will be part of.

The building design can save cost and allow the GeoEco plant to serve more buildings by reducing peak loads through a high-performance envelope, including reasonable glazing percentage and above-code insulation, as well as high performance mechanical systems and demand response systems.

Consolidation of energy intensive lab/shop spaces into the new addition, whose processes require large amounts of fresh air and exhaust, will allow for sustainable energy efficient solutions that cannot be accommodated within the existing building due to practical spatial restraints. Energy efficient solutions include capture of waste energy from the exhaust air to pre-heat and pre-cool the ventilation air, variable flow demand-based ventilation systems, filtering and recycling air from sawdust collection systems.

ELCCA & LCCA: Washington State requires capital projects to engage in Energy Life Cycle Cost Analysis (ELCCA) per the Department of Enterprise Services (DES) Assessment as well as a Life Cycle Cost Analysis (LCCA) per the Office of Financial Management (OFM). The design team and University will strive to use these requirements as an opportunity to study high-performance design to reduce energy use and cost in detail and make informed decisions about energy-saving strategies, in line with Washington State's greenhouse reduction goals for new buildings. Meeting these requirements requires a robust energy modeling effort including ASHRAE Standard 209.

Wellness: Americans spend 90% of our time indoors, so buildings need to support human health. Part of the LEED system and EWU's mission includes supporting student wellness, beyond the air pollution and climate pollution reductions that are part of energy-related strategies above. Student health and educational outcomes can be improved through sensitive daylighting, a mix of social and separate spaces, materials selection to reduce or eliminate toxins, abundant fresh air, biophilia, access for a range of mobility and learning modes and more. Increasing the insulation value of the existing building will significantly increase thermal comfort as well. The design of the building during the next phase is critical for these goals.

EWU Campus Landscape Vision and Prairie Restoration Project: These plans work toward a resilient, sustainable campus landscape that is part of student experience and engagement towards ecological restoration. This plan includes dedicating "a third of campus land and resources for students to actively participate in a real-world, multidisciplinary project designed to restore a threatened ecosystem in our region." This includes low-maintenance Xeriscape, plantings that do not need watering after establishment, installed previously at EWU as part of the Interdisciplinary Science Center project as a water-saving feature. High performance, water-saving plumbing fixtures are anticipated in the LEED scorecard.

Embodied Carbon and the Buy Clean, Buy Fair Act: Since an all-electric building will have close to zero greenhouse gas emissions from energy use, nearly all greenhouse gases will be released in the creation, transportation, and installation of construction materials, referred to as embodied carbon. The most important embodied carbon strategy – building reuse – is already integrated into the Predesign preferred alternate. Reusing and renovating nearly all of the existing buildings means that the biggest impact materials – structure and enclosure – only need minor updates instead of building from all new materials. In the next phase additional embodied carbon reductions through material selection and specifications, especially concrete, will contribute LEED points and an overall project carbon reduction. Emerging low-carbon steel and concrete, along with mass timber, can be considered during design.

HB 1282 was passed in 2024, requiring disclosure of Environmental Product Declarations (EPDs) that include greenhouse gas emissions information for certain materials on state projects > 50,000 sf such as this one, beginning in July 2026.

## Archeological and Cultural Resources

No archeological or cultural resources are known or anticipated. Per Governor's Executive Order 21-02, EWU has initiated consultation with DAHP and affected tribes; see DAHP and Tribal Letters in the Appendix. DAHP has noted that a survey of Cadet Hall showing non-significance will be required to complete their review. This survey is in progress.

## ADA Implementation

The project complies with Executive Order 96094, the Americans with Disabilities Act.

## Planning Compliance

The Preferred Alternative complies with planning under Chapter 36.70A RCW, as required by RCW 43.88.0301.

## Information required by RCW 43.88.0301(1)

|                               |   |
|-------------------------------|---|
| RCW 43.88.0301(1)(a)(i):      | No  |
| RCW 43.88.0301 (1)(a)(ii)(A): | No, not within the urban growth area.<br>Yes, part of planned employment growth.            |
| RCW 43.88.0301 (1)(a)(ii)(B): | Yes. EWU growth provides growth in Cheney and graduates with skills used by local industry. |
| RCW 43.88.0301 (1)(b)(i):     | Yes   |
| RCW 43.88.0301 (1)(b)(ii):    | No  |
| RCW 43.88.0301 (1)(b)(iii):   | Yes   |

## Other Codes & Regulations

EWU engineering building is expected to comply with the following codes:

|                |  |
|----------------|--|
| Building       | International Building Code, latest edition with Washington State amendments, WAC 51-50  |
| Fire           | International Fire Code, latest edition with Washington State amendments, WAC 51-54<br>NFPA 13 Standard for the Installation of Sprinkler Systems  |
| Mechanical     | International Mechanical Code, latest edition with Washington State amendments, WAC 51-52  |
| Plumbing       | Uniform Plumbing Code, current Washington State-required edition with amendments, WAC 51-56 & 57   |
| Electrical     | National Electric Code, current Washington State-required edition, WAC 296-46B   |
| Energy         | Washington State Non-Residential Energy Code, latest edition, WAC 51-11  |
| Accessibility  | Accessible and Usable Buildings and Facilities, ICC/ANSI 117.1, current Washington State-required edition  |
| Air Quality    | Washington State Ventilation and Indoor Air Quality Code, WAC 51-13  |
| Elevators      | American Society of Mechanical Engineers (ASME) A17.1, current Washington State-required edition   |
| Sustainability | High-performance public buildings (Chapter 39.35D RCW).<br>State efficiency and environmental performance (Executive Order 20-01)<br>State Energy Standards for Clean Buildings (RCW 19.27A.210)<br>Greenhouse Gas Emissions Policy (RCW 70A.45.070) |
| Seismic        | American Society of Civil Engineers Minimum Design Loads for Buildings and Other Structures ASCE 7-16  |

EWU Engineering building is expected to comply with the following standards:

- American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

- ASHRAE Standard 62.1 – Ventilation for Acceptable Indoor Air Quality
- ASHRAE Standard 55 – Thermal Comfort
- Sheet Metal Contractors Association of North America (SMACNA)
- American Society of Plumbing Engineers (ASPE)
- Eastern Washington University, Design and Construction Guidelines

### **Preliminary Building Code Analysis**

The following code analysis identifies critical issues in the 2021 International Building Code that must be addressed during the design process; however, it is not intended as a complete investigation of relevant code requirements.

Use and Occupancy Classification (Chapter 3): The building occupancy will be classified as Group B, with Group S-2 spaces for low-hazard general storage and possibly Group H-2 spaces for hazardous storage.

Construction Type (Chapter 5): Type II-A, fully sprinklered construction is assumed for this report.

Building Height and Area (Chapter 5): Predesign concept plans have determined that the Engineering building will be 3 stories in height, with total size of about 82,500 gross square feet. The largest single floor will be approximately 26,000 square feet. Type II-A fully sprinklered buildings with Group B occupancies are allowed to be up to 112,500 square feet per story, up to 85 feet in height, and a maximum of 6 stories tall. H-2 occupancies are allowed on any floor up to two stories above grade.

Fire Resistive Construction (Chapter 6 & 7): Per IBC 602.2, all building elements are to be of noncombustible construction.

| <u>Building Element</u>     | <u>Required Rating</u>                               |
|-----------------------------|--|
| Structural Frame            | 1-hour   |
| Exterior Bearing Walls      | 1-hour   |
| Interior Bearing Walls      | 1-hour   |
| Exterior Non-bearing Walls  | Unrated with greater than 30-foot separation         |
| Int. Non-bearing Partitions | Unrated unless providing required separation         |
| Floors                      | 1-hour   |
| Roofs                       | 1-hour   |
| Shaft Enclosures            | 1-hour   |
| Exterior Openings           | Unprotected with no limit if over 20-foot separation |

Note: The provision of an automatic fire sprinkler system through the building may eliminate the requirement for 1-hour fire resistive construction in some building elements.

Occupant Load (Table 1004.1.1):

| <u>Area</u>      | <u>Occupant Load Factor</u> |
|------------------|-----------------------------|
| Classrooms       | 20 sf/ occupant             |
| Laboratories     | 50 sf/ occupant             |
| Offices          | 150 sf/ occupant            |
| Storage          | 300 sf/ occupant            |
| Mechanical Rooms | 300 sf/ occupant            |

Egress Requirements (Chapter 10):

| <u>Egress Element</u> | <u>Requirement</u>   |
|-----------------------|--|
| Exit Width            | Stairs: 0.3"/ occupant, minimum 44" wide for occ. load > 50  |
| Door Width            | 0.2"/ occupant, minimum 32" wide clear opening   |
| Exit Corridors        | Minimum 44" wide   |
| Number of Exits       | 2 when occupant load > 50, 3 when occ. load > 500  |
| Exit Location         | Exits shall be located at a distance apart equal to not less than one third of the length of the maximum diagonal dimension of the building or area served, where building is equipped with automatic sprinkler systems. |
| Travel Distance       | Travel distance shall not exceed 300' in a sprinklered. Group B occupancy. H-2 occupancies are limited to shorter allowable travel distances, 100'.  |

## 5.7 PROBLEMS, COMPONENTS, TECHNOLOGY, SECURITY, COMMISSIONING

Problems Requiring Future Study: No problems requiring future study have been identified.

Significant Components: No significant or distinguishable components, including major equipment and ADA requirements in excess of existing code have been identified.

Planned Technology Infrastructure: The project is planned to conform with EWU's IT protocols and specifications with typical IT infrastructure for the space use types. See the Outline Specifications and Laboratory Room Data Sheets in the Appendix for more detail.

Security Measures: The project is planned to conform to EWU's security guidelines and includes typical security measures for the space use types. See the Outline Specifications in the Appendix for more detail.

Planned Building Commissioning: Building commissioning is integrated into schedule to verify via documentation that all building systems perform interactively and according to the design intent.

This page intentionally left blank

# **6.0 PHASING, DELIVERY, SCHEDULE & MANAGEMENT**

---

**6.1 PHASING OPPORTUNITY**

**6.2 DELIVERY METHOD**

**6.3 IMPLEMENTATION & MANAGEMENT**

**6.4 MILESTONE SCHEDULE**

**6.5 SCHEDULE FACTORS**

## **6.1 PHASING OPPORTUNITY**

The project can be phased as noted below. The decision to phase and phasing details will be determined in the Design phase. This report, including schedule and cost estimate, assumes the Engineering Building and targeted renovations of CEB and Cheney Hall occur in a single phase.

### **Preliminary Phasing Strategy**

- Phase 1: Engineering Building construction with connections to CEB. CEB and Cheney remain occupied during construction. Loading for CEB would occur at the Ground Floor during construction.
- Phase 2: Renovations of CEB and Cheney Hall.

## **6.2 DELIVERY METHOD**

Eastern Washington University intends to employ the traditional Design/Bid/Build approach for this project. Previous major capital projects at EWU have been successfully executed within or under the allocated budget using this method. Its cost-effectiveness aligns well with the regional context and the construction administration capabilities available to EWU. Presently, there's no compelling reason for EWU to seek approval for an alternative delivery method under RCW 39.10.

## **6.3 PROJECT MANAGEMENT**

The University's Construction & Planning office will manage the design and construction of this project. The Associate Vice President for Facilities and Planning is responsible for overall organization management. Construction & Planning provides oversight of programming; predesign; cost estimating; design and construction services for building alterations, new construction, and grounds improvements for the Cheney campus.

Project managers organize and administer the work of outside design consultants and public works contractors. They follow projects all the way through construction and work closely with clients, project architects, designers and consultants to ensure projects are on time and within budget.

The following individuals in the Construction & Planning office will oversee this project:

|             |                                   |
|-------------|-----------------------------------|
| Kris Jeske  | Director, Construction & Planning |
| Troy Bester | Senior Project Manager            |

The cost for the University's management of the design and construction is included in the Project Budget Analysis section of this report

## 6.4 MILESTONE SCHEDULE

## 6.5 SCHEDULE FACTORS

### Value Engineering and Constructibility

Value-engineering analysis and constructability review will be integrated throughout the design and building process, and the time has been factored into the schedule above.

### Project Delays

The proposed construction and completion of the new GeoEco Plant, which will provide geothermal heating and cooling to this project, is planned as a separate project. The completion of the GeoEco Plant will be required before the completion of this project, as it will serve as the sole source of building heating and domestic hot water.

### Permitting

Buildings on EWU’s campus are subject to the governing codes of the City of Cheney. EWU maintains a good working relationship with the City of Cheney and discusses each project with the City prior to implementation. It is anticipated that during the design process, the university and design team will meet periodically with officials of the City to ascertain that building plans are in conformance to the City’s requirements.

### Local Government Ordinances or Neighborhood Issues

No known local government ordinances or neighborhood issues.

### Local Jurisdiction & Community Engagement

The local jurisdiction will be notified during the design phase. Meetings with local engineering industry partners are planned as part of the process. Community stakeholder meetings are not currently anticipated.

# **7.0 PROJECT BUDGET ANALYSIS PREFERRED ALTERNATIVE**

---

**7.1 COST ESTIMATE ASSUMPTIONS**

**7.2 CONSTRUCTION COST ESTIMATE UNIFORMAT LEVEL II SUMMARY**

**7.3 PROPOSED PROJECT COST**

**7.4 FURNITURE, FIXTURES & EQUIPMENT**

**7.5 PROPOSED FUNDING**

**7.6 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS**

**7.7 C100**

## 7.1 COST ESTIMATE ASSUMPTIONS

The following assumptions have been made as the basis for the Engineering Building project budget:

- The Engineering Building and targeted renovations to CEB and Cheney Hall will be constructed as a single phase.
- The construction start date will be July 2027.
- The construction period will be 32 months.
- Design/Bid/Build delivery method will be utilized.
- The project will follow the Outline Specifications included in the Appendix of this report.
- The Engineering Building will be designed to achieve a minimum LEED silver rating.
- The Engineering Building will be designed to comply with the codes and standards cited in this report.
- New mechanical, plumbing and electrical services will be provided complying with local building codes and campus standards.
- Heating and domestic hot water to the Engineering Building and renovated CEB will be provided by a connection to a new campus low temperature heating water (LTHW) system which is a separate campus GeoEco Plant project. This system will operate at 120°F. 50' of dedicated 6"Ø low temperature hot water supply and return piping is anticipated be routed across from mains installed as part of the GeoEco Plant project to the building utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.
- New utility tunnel connections will bring campus steam, chilled water, electrical and telecommunications to the buildings.
- The Engineering Building will be sprinklered throughout.
- Approximately 24 of the existing parking stalls will be removed and/or relocated as part of this project. A new loading zone from Washington Street via Parking Lot Three will be constructed.
- Subgrade soil conditions are expected to be similar to those at nearby buildings. A geotechnical investigation for the site has not been completed. Soils reports from the adjacent JFK Library and the nearby CEB indicate that site soils consist of a thin stratum of topsoil over medium stiff clayey silt or clay (Palouse formation) over stiffer Saprolite clays over basalt bedrock.
  - ❖ At CEB the clays extend down to as deep as 40 feet with groundwater encountered at 10 to 15 feet deep, and foundations consist of spread footings over rock bearing pads, which are located in stiffer Saprolite clays below the Palouse formation layer.
  - ❖ At JFK the site is clay silt over basalt bedrock at depths ranging from 12-17.5 feet below grade with ground water present, and the foundations are taken to bedrock utilizing concrete piers, and there is a foundation dewatering system.
  - ❖ The adjacent campus utility tunnel has dewatering sumps that pump to the stormwater system.
  - ❖ The presence of groundwater is expected on the project site, necessitating the inclusion of a permanent dewatering system for the utility tunnel connection and basement area.

## 7.2 CONSTRUCTION COST ESTIMATE UNIFORMAT LEVEL II SUMMARY

A detailed construction cost estimate for new building, existing building work and site improvements was prepared by a professional cost estimator. See Appendix for detailed estimate.

### New Engineering Building Construction:

|  |                                   |                     |
|--|-----------------------------------|---------------------|
| A10  | Foundations                       | \$1,267,643         |
| A20  | Basement Construction             | \$575,940           |
| B10  | Superstructure                    | \$5,812,905         |
| B20  | Exterior Closure                  | \$3,681,412         |
| B30  | Roofing                           | \$1,168,398         |
| C10  | Interior Construction             | \$3,119,207         |
| C20  | Stairs                            | \$175,000           |
| C30  | Interior Finishes                 | \$3,392,694         |
| D10  | Conveying                         | \$525,000           |
| D20  | Plumbing Systems                  | \$3,465,924         |
| D30  | HVAC Systems                      | \$8,912,376         |
| D40  | Fire Protection Systems           | \$453,871           |
| D50  | Electrical Systems                | \$8,087,156         |
| E10  | Equipment (built in)              | \$3,213,230         |
| E20  | Casework & Furnishings (built in) | \$918,880           |
| Subtotal New Building Construction             |                                   | \$44,769,635        |
| <u>Design Contingency/ Contractor Overhead</u> |                                   | <u>\$12,714,576</u> |
| Total New Building Construction Cost           |                                   | \$57,484,211        |

### Existing CEB Building Construction:

|  |                                   |                    |
|--|-----------------------------------|--------------------|
| C10  | Interior Construction             | \$1,135,668        |
| C30  | Interior Finishes                 | \$1,291,712        |
| D20  | Plumbing Systems                  | \$522,437          |
| D30  | HVAC Systems                      | \$3,894,156        |
| D40  | Fire Protection Systems           | \$145,340          |
| D50  | Electrical Systems                | \$1,924,769        |
| E10  | Equipment (built in)              | \$261,544          |
| E20  | Casework & Furnishings (built in) | \$304,035          |
| F20  | Selective Demolition              | \$336,500          |
| Subtotal Existing CEB Building Construction    |                                   | \$9,816,161        |
| <u>Design Contingency/ Contractor Overhead</u> |                                   | <u>\$2,577,724</u> |
| Total Existing CEB Building Construction Cost  |                                   | \$12,393,885       |

### Existing Cheney Building Construction:

|   |                                   |                  |
|---|-----------------------------------|------------------|
| C10   | Interior Construction             | \$22,532         |
| C30   | Interior Finishes                 | \$109,160        |
| D20   | Plumbing Systems                  | \$41,629         |
| D30   | HVAC Systems                      | \$157,345        |
| D40   | Fire Protection Systems           | \$11,581         |
| D50   | Electrical Systems                | \$153,370        |
| E10   | Equipment (built in)              | \$25,226         |
| E20   | Casework & Furnishings (built in) | \$23,475         |
| F20   | Selective Demolition              | \$28,951         |
| Subtotal Existing Cheney Hall Building Construction   |                                   | \$573,270        |
| <u>Design Contingency/ Contractor Overhead</u>        |                                   | <u>\$150,541</u> |
| Total Existing Cheney Hall Building Construction Cost |                                   | \$723,811        |

Site Construction:

|     |   |                     |
|-----|---|---------------------|
| G10 | Site Preparation  | \$1,743,564         |
| G20 | Site Improvements   | \$726,364           |
| G30 | Site Civil / Mechanical Utilities                           | \$285,700           |
| G40 | Site Electrical Utilities                                   | \$670,000           |
| G50 | Other Site Construction                                     | \$137,500           |
|     | <u>Design Contingency/ Contractor Overhead</u>              | <u>\$935,677</u>    |
|     | Total Sitework Construction Cost                            | \$4,498,805         |
|     | <u>General Conditions &amp; Support Services</u>            | <u>\$3,680,000</u>  |
|     | Unescalated Maximum Allowable Construction Cost (MACC)      | \$78,780,712        |
|     | <u>Escalation to Midpoint of Construction (Q4, 2028)</u>    | <u>\$14,180,528</u> |
|     | <b>Escalated Maximum Allowable Construction Cost (MACC)</b> | <b>\$92,961,240</b> |

### 7.3 PROPOSED PROJECT COST

Escalated project costs for the Engineering Building are summarized as follows; detailed project costs have been submitted to OFM through the online Capital Budgeting System.

|                              |                      |
|------------------------------|----------------------|
| Acquisition Costs            | \$0                  |
| Consultant Services          | \$9,569,384          |
| Construction Contracts       | \$106,942,195        |
| Equipment                    | \$6,403,647          |
| Art Work                     | \$636,743            |
| Other Costs                  | \$0                  |
| Project Management           | \$4,433,304          |
| <b>Total Project Request</b> | <b>\$127,985,272</b> |

**7.4 FURNITURE, FIXTURES & EQUIPMENT:** Included in the project budget.

**7.5 PROPOSED FUNDING:** The Engineering Building will be a State funded project.

### 7.6 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS

#### Assumptions

The following estimates of operations and maintenance costs, including FTEs, for the Engineering Building are based on the “EWU’s Annual Cost per Gross Square Foot” for FY24. Costs are escalated at an inflation rate of 3.0 % per year. Through careful project sequencing and/or phased construction, moving costs are estimated to be minimal. No additional operating costs are anticipated after the renovations of CEB and Cheney Hall.

#### Impact & Agency Responsible

The Engineering Building project will be maintained by the Owner. It will result in an increase to operations and maintenance costs for the campus. The new building will require an increase in the custodial staff, maintenance staff, goods and services, and utility costs.

#### Operations and Maintenance Cost

Current campus operations and maintenance costs for FY25 are shown in Table 1. For the Engineering Building, the projected operations and maintenance costs for the first full year of occupancy (FY2030) and five subsequent biennia are shown in Table 2.

Table 1: Operations and Maintenance - Current Campus

| Operations                         | Operating cost GSF/YR |
|------------------------------------|-----------------------|
| Component :                        | FY25                  |
| 091-Utilities                      | \$3.89                |
| 092 - Bldg & Utilities Maintenance | \$2.73                |
| 093 - Custodial & Grounds Service  | \$3.56                |
| 094 - Ops & Maintenance Support    | \$3.73                |
| Total Annual Per GSF               | \$13.91               |

Table 2: Operations and Maintenance - Projected Engineering Building

| Operations                          | Operating cost GSF/YR | Cost 2032   | Cost 2034   | Cost 2036   | Cost 2038   | Cost 2040   |
|-------------------------------------|-----------------------|-------------|-------------|-------------|-------------|-------------|
| Component :                         | FY30                  |             |             |             |             |             |
| 091-Utilities                       | \$4.51                | \$4.78      | \$5.08      | \$5.38      | \$5.71      | \$6.06      |
| 092 - Bldg. & Utilities Maintenance | \$3.16                | \$3.36      | \$3.56      | \$3.78      | \$4.13      | \$4.25      |
| 093 - Custodial & Grounds Service   | \$4.13                | \$4.38      | \$4.64      | \$4.93      | \$5.38      | \$5.55      |
| 094 - Ops & Maintenance Support     | \$4.32                | \$4.59      | \$4.87      | \$5.16      | \$5.64      | \$5.81      |
| Total Annual Per GSF                | \$16.13               | \$17.11     | \$18.15     | \$19.25     | \$20.87     | \$21.67     |
| Total GSF                           | 82,522                |             |             |             |             |             |
| Total Annual Operating Cost         | \$1,330,709           | \$1,411,749 | \$1,497,724 | \$1,588,936 | \$1,722,131 | \$1,788,361 |

## 9.1 PREDESIGN CHECKLIST

### Appendix 1: Predesign checklist and outline

A predesign should include the content detailed here. OFM will approve limited scope predesigns on a case-by-case basis.

#### Executive summary

Problem statement, opportunity, or program requirement

- Identify the problem, opportunity, or program requirement that the project addresses and how it will be accomplished.
- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location, or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals, and objectives; statutory requirements; and the problem, opportunity, or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

#### Analysis of alternatives (including the preferred alternative)

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost [Model](#) (RCW [39.35B.050](#)).
    - Schedule estimates for each alternative. Estimate the start, midpoint, and completion dates.

#### Detailed analysis of preferred alternative

- Nature of space – how much of the proposed space will be used for what purpose (i.e., office, lab, conference, classroom, etc.)
- Occupancy numbers.
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site analysis:
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floorplans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
  - Consistency with applicable long-term plans (such as the Thurston County and Capitol campus master plans and agency or area master plans) as required by RCW 43.88.110.

- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter [39.35D](#) RCW).
  - State efficiency and environmental performance, if applicable (Executive Order [20-01](#)).
  - State energy standards for clean buildings (RCW [19.27A.210](#)).
  - Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW [19.27.540](#)).
  - Greenhouse gas emissions reduction policy (RCW [70.235.070](#)).
  - Archeological and cultural resources (Executive Order [21-02](#) and [Section 106](#) of the National Historic Preservation Act of 1966). If mitigation is anticipated, please note this in the predesign with narrative about how mitigation is worked into the project schedule and budget.
  - Americans with Disabilities Act (ADA) implementation (Executive Order [96-04](#)).
  - Compliance with planning under Chapter [36.70A](#) RCW, as required by RCW [43.88.0301](#).
  - Information required by RCW [43.88.0301](#)(1).
  - Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project, including impacts to current lease contracts. Include detail on the need to backfill space or cost assumptions for vacant space.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative. The proposed method of project delivery must be justified.
- Describe how the project will be managed within the agency.
- Schedule.
- Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
- Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110](#)(5)(c).
- Describe factors that may delay the project schedule.
- Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
- Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

### Project budget analysis for the preferred alternative

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The [C-100](#).
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
  - If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement, and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

### Pre-design appendices

- Completed Life Cycle Cost [Model](#).
- A letter from DAHP.
- Title report for projects including proposed acquisition.

## 9.2 DAHP AND TRIBAL NOTIFICATION LETTERS

Allyson Brooks Ph.D., Director  
State Historic Preservation Officer

June 13, 2024

Troy Bester  
Eastern Washington University

In future correspondence please refer to:  
Project Tracking Code: 2020-06-04168  
Property: EWU Engineering Building  
Re: More Information Needed, Survey Requested

Dear Troy:

Thank you for contacting the Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Office (SHPO) under provisions of Governor's Executive Order 21-02. Our review is based upon documentation provided in your submittal. We understand this request is only regarding the predesign of the project, and appreciate you consulting with DAHP early on in project development.

In order to complete our review, we request an intensive level survey of Cadet Hall. Cadet Hall is proposed to be demolished as part of the project scope and has not been surveyed for eligibility to the National Register of Historic Places. Cadet Hall was built in 1956 and may be significant for its association with the successful ROTC program at EWU.

Before we can assess project impact on historic resources, we need to know what historic resources are present in the project area. An [intensive-level survey](#) and updated Historic Property Inventory Form completed by a [Secretary of the Interior Qualified Architectural Historian](#) will assist us in making this determination.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer in conformance with Executive Order 21-02. Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A  
Architectural Historian

Jill Maria Wagner, PhD  
Tribal Historic Preservation Officer  
Coeur d'Alene Tribe

RE: Propose Project at Eastern Washington University  
Engineering Building  
EWU Project No. CP1141

Dr. Wagner:

This letter is to notify you of a proposed Engineering Building, on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the university will be submitting a predesign report for state review/approval of the project on June 30, 2024.

The proposed new building will be connected to the Computing and Engineering Building (CEB) to address current facility deficiencies and meet the future needs of the proposed civil engineering academic program. The 82,522 GSF building will accommodate hands-on teaching and research laboratories, lab support facilities, student meeting and study areas, and faculty offices. Additionally, 42,411 GSF of the CEB and nearby Cheney Hall will be modified to support the program.

The initial site proposed for construction is on the south side of CEB, which necessitates the demolition of Cadet Hall and an adjacent parking lot. Built in 1955, Cadet Hall currently houses the ROTC program for the EWU campus, which will be relocated to another facility on campus. EWU will perform an Intensive-level survey and updated Historic Property Inventory Form for Department of Archaeology and Historic Preservation (DAHP) prior to design. Sitework for the project will include providing utilities from a proposed nearby geothermal plant, as well as paving parking areas and landscaping. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Sincerely,

Troy Bester  
Senior Project Manager

*EWU expands opportunities for personal transformation through excellence in learning.*

## 9.3 PREDESIGN STUDY PROCESS PARTICIPANTS

### EASTERN WASHINGTON UNIVERSITY

#### EWU ENGINEERING DEPARTMENT

David Bowman, Dean, College of Science, Technology, Engineering, and Mathematics

Jennifer Waldo, Associate Dean, College of Science, Technology, Engineering, and Mathematics

#### *2024 Faculty Participants*

Jason Durfee, Department Chair & Professor, MENT, MET Program Coordinator

Richard Orndorff, Professor, Geosciences

Chad Pritchard, Professor, Geosciences

Awlad Hossain, Professor, ME, MET, ME Program Coordinator

Jennifer Leaf, Assistant Professor, ME

Troy Krumrey, Lecturer, Manufacturing/Technology, Construction

Joe Stoutimore, Engineering Technician 2

#### *2020 Faculty Participants*

Martin Weiser, Department Chair & Associate Professor, ME & MET

Terence Geyer, Senior Lecturer, Applied Technology, Technology/Manufacturing

Rusty Hallin, Lecturer, Applied Technology, Technology/Manufacturing

James S. McCuiston, Lecturer, Distance Education & Technology

Donald Richter, Professor, ME, MET & Technology/Manufacturing

Gary Weber, Lecturer, ME & MET

#### EWU FACILITIES AND PLANNING

Kris Jeske, Director, Construction & Planning

Troy Bester, Senior Project Manager

### DESIGN TEAM

#### LMN Architects (Architect)

Jennifer DuHamel

Jennifer Milliron

Rachel Dinkel

Kjell Anderson

Stephen Van Dyck

#### Research Facilities Design (Laboratory Planner)

Terry D. Brown

Jeff R. Schulien

#### Saiful Bouquet (Structural Engineer)

Saiful Islam

YK Low

#### Coughlin Porter Lundeen (Civil Engineer)

Tim Brockway

Ken Wiersema

#### MW Consulting Engineers (Mech/Elec Engineer)

Anthony Schoen

Joel Enevold

Kjersten Khuta

#### Roen Associates (Cost Estimator)

Dan Deymonaz

Jovelyn Limbag

## 9.4 PRELIMINARY LEED CHECKLIST

### LEED

Washington State requires sizable capital projects to achieve a minimum of LEED Silver. Several projects at EWU have achieved LEED Gold.

### LEED v4/v4.1 for BD+C: New Construction and Major Renovation Project Checklist

| Y         | ?         | N         |                                    |   |           |

9.6 PRELIMINARY CONSTRUCTION COST ESTIMATE

**Construction Cost Summary**

Owner: Eastern Washington University  
 Project: EWU Engineering Building

**ESTIMATED COSTS SUMMARY**

June 25, 2024

**Alternative 1 - New Building with CEB Renovation**

| Item   | Description                           | QTY    | UOM  | \$ / UOM      | Cost                 |
|--|---------------------------------------|--------|------|---------------|----------------------|
| 1  | New Engineering Building              | 82,522 | BGSF | \$ 696.60     | \$ 57,484,211        |
| 2  | Existing Building Work - CEB          | 39,281 | BGSF | \$ 315.52     | \$ 12,393,885        |
| 3  | Existing Building Work - Cheney       | 3,130  | BGSF | \$ 231.25     | \$ 723,811           |
| 4  | Sitework                              | 65,000 | SGA  | \$ 69.21      | \$ 4,498,805         |
| 5  | General Conditions & Support Services | 32     | MO   | \$ 115,000.00 | \$ 3,680,000         |
| <b>Total Estimated Construction Cost (Today's Dollars)</b> |                                       |        |      |               | <b>\$ 78,780,712</b> |
| 6  | Escalation to Midpoint (Q4, 2028)     | 18.00% | on   | \$ 78,780,712 | \$ 14,180,528        |
| <b>Total Construction Cost (Escalated)</b>                 |                                       |        |      |               | <b>\$ 92,961,240</b> |

**COMMENTS:**

Design, Bid, Build delivery method is assumed  
 Assumes a Q3, 2027 start and a 32 month schedule  
 No Site Frontage Improvements are included or anticipated.

**Project Owner:** Eastern Washington University  
**Project Name:** EWU Engineering Building  
**Project Location:** Cheney, WA  
**Project Start Date:** Q3, 2027  
**Estimate Date:** June 25, 2024

**Architect:** LMN Architects  
**Project Duration:** 32 MO  
**Building GSF:** 82,522  
**Site GSF:** 65,000

| ESTIMATE SUMMARY  |                        | Quantity      | Unit of Measure | Unit Cost        | Total Estimated Cost |

## 9.8 OUTLINE SPECIFICATIONS

The following outline specifications form the basis for the Engineering Building construction costs:

### **A Substructure**

#### A10 Foundations

A prior geotechnical report for this project was prepared by AMEC Earth and Environmental Inc. dated October 8, 2001. The geotechnical report recommends shallow foundation system for new Engineering Building. Existing soft clay soils will be over-excavated approximately 2 to 4 feet below bottom of footings and replaced with compacted structural fill to accommodate for the shallow foundation. Compacted fill will likely need to be imported as existing site soil is not considered appropriate due to its long term compressibility. Perched ground water was encountered at depth of 6 to 10 feet below ground surface during the soil exploration.

New column foundation at the vicinity of an existing utility tunnel traversing at the west of the building site will be designed to minimize the surcharge load to the tunnel.

#### A20 Basement

Basement wall will consist of 12" thick concrete wall with continuous wall footing and slab on grade can be 5" thick reinforced concrete slab underlain by properly prepared subgrade. A soil report addendum will be required to provide updated design information per the current building code.

### **B Shell**

#### B10 Substructure

Floor to Floor Height: A height of 18'-0" floor to floor at the ground level and level two is established to accommodate the robust mechanical and electrical equipment serving the 'shop' like laboratories. A height of 16'-0" floor to floor will be used at levels one to align with the floor to floor of CEB for ease of connecting into the existing building.

#### Codes:

The governing building code will be the International Building Code, latest edition with Washington State amendments, WAC 51-50. Other referenced design codes are anticipated to include the AISC Manual of Steel Construction (LRFD), Second Edition, ACI Building Code, Commentary, ACI 318 14, ASCE 7-16 and AWS Structural Welding Code (AWS D 1.1 10).

#### Design Load

- Live Loads:

|   |                        |
|---|------------------------|
| Classrooms, Offices and Interior Spaces | 81 psf, reducible      |
| Lobby, Exterior and Exit Areas          | 100 psf, reducible     |
| Light Storage                           | 125 psf, non-reducible |
| Laboratory and Laboratory Support Area  | 100 psf, reducible     |
| Roof                                    | 20 psf, reducible      |
  
- Dead Loads:
  - General: Estimated weight of construction material.
  - Partitions: 10 psf included in seismic mass per building code requirement; 15 psf minimum for gravity design.
  - Typical ceiling and finishes: 5 psf.
  - Mechanical Equipment: 100 psf or actual weight of mechanical equipment.
  
- Lateral Loads:

Seismic design criteria will be based on ASCE 7-16.

Seismic Design Parameters:

|                                      |   |
|--------------------------------------|---|
| Risk Category                        | III   |
| Seismic Design Category              | D   |
| Design Spectral Response Coefficient | SDS = 0.312                                   |
| Design Spectral Response Coefficient | SD1 = 0.177                                   |
| Importance Factor                    | I = 1.25                                      |
| Structural Response Modification     | R = 8 (Steel Buckling-Restrained Brace Frame) |
| Deflection Amplification Factor      | Cd = 5  |
| Drift Limit                          | 2.0%  |
| Seismic Design Category              | E   |

Wind Design Parameters:

|                        |                    |
|------------------------|--------------------|
| Wind Basic Wind Speed  | 115 miles per hour |
| Wind Exposure          | B                  |
| Wind Importance Factor | I = 1.0            |

Materials

Concrete

- f'c = 5,000 psi (NWC); All columns
- f'c = 5,000 psi (NWC); All beams and slab
- f'c = 5,000 psi (NWC); Basement Walls
- f'c = 4,000 psi (NWC); Column Footings
- f'c = 4,000 psi (NWC); Basement Wall Footings
- f'c = 4,000 psi (NWC); Slab on grade
- f'c = 3,000 psi (LWC); Concrete on Metal Deck

Reinforcing steel

ASTM A615 Grade Steel 60 ksi or 75 ksi except as noted on the drawings.

Structural Steel

- ASTM 992 for all structural shapes except as noted otherwise
- ASTM A500, Grade B for all structural tubes
- A490 Anchor bolts
- A325 High strength bolts, except as noted otherwise

Gravity-Load Resisting System

- Steel construction with concrete filled metal decks supported on steel beams is proposed. The elevated floors and roof diaphragms will consist of 3 ¼" light-weight concrete over 3" metal deck on steel beams and girders, supported by steel columns.

Lateral-Load Resisting System:

Braced Frame above Level 1 and concrete shear walls below are used to provide seismic bracing for the Engineering Building. Buckling Restraint Braced Frames (BRBF) will be used in both directions at the upper floors and evenly distributed throughout the building and strategically located within the stair and shaft walls. BRBF's will transition to concrete shear walls at the Ground Level.

BRBF/Concrete shear wall scheme was selected over others because it offered added values and opportunities that significantly enhanced the project. Benefits of the proposed structural scheme

include:

- Provides a much more sustainable, lighter and a very high-performing structure.
- BRBF/Concrete shear wall are ideal for drift control due to their inherent stiffness. Strategic placement of the braced frames and shear walls adjacent to stair and restroom walls or partition allows total flexibility for space planning.
- The building, as designed, is very stiff and will have significantly less inter-story drift than what the code permits.
- The smaller story drift will limit the building damage in an earthquake event and allow restoration of building functionality and occupancy much more expeditiously than would be possible with other more flexible lateral force resisting systems.
- This is no vertical discontinuity in the braced frames. This not only simplifies the construction but also yields a structure which is much more robust.
- The proposed structural system is very cost-effective and also minimizes the construction time.
- Long-span roof structure over the Metallic Lab can be achieved economically with steel beams.

Penthouse Construction: Construction will be structural steel columns and bracing, and steel roof framing.

### B20 Exterior Enclosure

Exterior Walls:

- The brick wall system will include; an air cavity, rigid insulation, air barrier, sheathing, steel framing, batt insulation, a vapor barrier, and interior drywall.
- Steel framing will support curtain walls and window systems, and metal panel and louvered penthouse enclosure walls.

Exterior Windows, Doors and Louvers:

- Punched aluminum frame windows at laboratories within brick wall system, curtain walls at building entries and laboratory facades parallel to Washington Street and the Art Walk as well as glazed entrance doors will all be aluminum with anodized finish. All glazing will be insulated low-E performance glass.
- Operable vertical panel doors at laboratories to exterior.
- Hollow metal exterior doors and interior doors at mechanical spaces.
- Painted hollow metal doors and frames at mechanical spaces, service entrances, and emergency exits.
- Louvers will be painted aluminum, fixed and drainable.

### B30 Roofing

Roofing materials will include the following: thermoplastic membrane roofing over tapered rigid insulation, roof walkway pads, painted sheet metal coping at parapets, and roof stanchion tie-offs.

## **C Interiors**

### C10 Interiors Construction

Partitions: Typical interior partitions will be metal studs with 5/8" type 'x' gypsum wallboard, impact resistant gypsum wallboard on all corridor walls, and acoustic insulation where required. All demising walls will be built to underside of structure. Fire and smoke stopping will be provided at all rated wall and floor penetrations.

Doors: Interior doors will be of formaldehyde free solid core particle board, or mineral cores at labeled doors, with stained hardwood veneer faces. Doors will have satin stainless steel finish hardware with required accessories. Interior door and reight frames will be of hardwood or

painted hollow metal, with fire rated glass where required.

### C20 Stairs

The two egress stairs will also serve as the communicating stairs and are located adjacent to the building entries and will have steel structure with architectural detailing including precast concrete treads and perforated metal risers. Doors into egress stair will be design to remain open on hold opens and automatically close in event of fire.

### C30 Interior Finishes

**Floor Finishes:** Interior floor finishes will include polished concrete in circulation areas and lobby/work area/ event space paralleling Washington Street, resilient tile in controlled research and Sensor Tech Lab and sealed concrete in all other teaching, project and research laboratories. Additional floor finishes include low VOC carpet tile at collaboration spaces and classrooms, ceramic tile at restrooms, sealed concrete at Tech Offices, support and back of house spaces and a durable traffic coating at the penthouse.

**Wall Finishes:** Interior wall finishes will include painted gypsum wallboard, ceramic tile at restrooms, acoustic wall panels in classrooms and at circulation, hardwood architectural detailing in the open student study lounge/work area, and corner guards as required. Sections of storefront glazing provide visibility into the teaching, project and research laboratories.

**Ceiling Finishes:** Interior ceiling finishes include exposed structure, painted gypsum wallboard, suspended acoustical ceiling systems, and wood slat ceiling clouds in public circulation area and collaboration areas.

Interior specialties: See E2015 Non-Laboratory Casework and Other Specialties.

## **D Services**

### D10 Conveying Systems

One 3 stop MRL passenger and one 4 stop MRL freight elevator with roof access will be provided, with ladders to the elevator pits.

### D20 Plumbing

D2010 Plumbing Fixtures:

Restroom wall hung water closets, urinals and lavatories will be constructed of commercial grade vitreous china. Lavatory traps and supplies will be insulated per accessibility requirements.

Hands free sensor operated electric faucets with integral thermostatic mixing controls will be provided on toilet room lavatories. Sensor operated electric flush valves will be used for water closets and urinals.

Lab sinks will either be epoxy as part of the casework or stainless steel for chemical resistance or durability. Custodial sinks will be provided with wall faucet and lever handles.

Emergency showers and eyewash stations within the labs/shops, as provided under E10, will be serviced from a new centralized tempered water system that delivers potable tepid water between 60 and 95 degrees to the safety stations.

Laboratory fume hoods, as provided under E10, will be pre-piped with utility connections at the top and rear of hood.

Water Conservation- The following items will be reviewed by the design team and Eastern

Washington University for Water Conservation and Long Term Campus Standardization / Maintenance considerations; dual flush (1.6/1.0 GPF) water closets, ultra-low flow water closets (1.28 GPF), pint flow urinals, and lavatory faucets to deliver 0.5 GPM.

#### D2020 Domestic Water Distribution:

Domestic cold water and 115-120°F hot water distribution systems will be provided throughout the building. The existing water heaters will be modified to service both the new addition and existing building.

A hot water recirculation system controlled through the campus energy management system (EMS) will be provided and distributed at low velocities, using “in-line” all-bronze circulating pumps.

Hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F. The existing water heating system in the basement of the existing building will be modified for expanded program demands.

Valves will be provided at all branch take-offs to individual fixture groups, and zone valves will also be provided. Balancing valves will be placed in return loops at connections of the hot water piping.

#### Materials:

Water Piping: Copper type L

#### D2030 Sanitary Waste System

A gravity sanitary drainage system will be provided to serve all plumbing fixtures and equipment (see also Lab Waste and Vent System under Section D2090).

Floor drains will be provided at safety showers in keeping with campus standards with the exception of metal shops that have the possibility of introducing oil into the sanitary sewer. Oil water separators are not anticipated at this time.

#### Materials:

Drain, Waste, Vent Piping (above grade) : Cast Iron

Waste Piping (below grade): PVC, ABS, or cast Iron

#### D2040 Rainwater Drainage

Gravity primary and overflow storm drainage systems will be provided to serve the roof levels with each system piped separately outside of the building. Rain leaders will be located within the heated portion of the building to prevent freezing of the pipe and will be insulated to prevent condensation from developing on the pipe. Overflow drains will terminate at grade level on splash blocks.

#### Materials:

Storm Drain Piping (above grade): Cast Iron

Storm Drain Piping (below grade): PVC, ABS, Cast Iron

#### D2090 Other Plumbing Systems

Compressed Air System: The existing air compressors are having issues with breakdowns due to age and wear. A new central compressed air system with duplex compressors, air drier and receiver storing 125 psig air will be provided for shop uses. Compressed air will be delivered at

100 psig and be piped throughout the laboratory/shop spaces. Isolated areas that require clean/dry air will have point of use driers and filters and air pressure regulators. The compressors will be located in the new addition to allow space for expanded water heaters in the existing mechanical room.

Lab Vacuum System: The existing vacuum pumps are obsolete and do not have available parts. A new vacuum pump and receiver will be provided in the new mechanical room to make room for expanded water utilities in the existing mechanical room. High vacuum needs will be provided from owner furnished, owner installed local pumps.

Natural Gas System: Natural gas from the existing building will be extended to the foundry for use in the kilns. Extensive use of natural gas is not anticipated.

Lab Specialty Gas Systems: Central house system for nitrogen and specialty gases are not anticipated. If required, these will be Owner provided at the point of use.

Welding Gas Systems: Central welding gas systems are not anticipated. Welding gases will be Owner provided from movable welding carts on wheels.

Industrial Water Systems: Cold and 115-120°F hot non-potable water distribution systems will be provided throughout the new addition to selected equipment and lab faucets. The systems will be isolated from the domestic water system with a reduced pressure backflow preventer assembly. Hot water heat exchangers and storage tanks will be the same as described in Section D2020 and will be located within the existing mechanical room.

Industrial Hot Water Recirculation System: A recirculation system will be provided and distributed at low velocities to ensure fixtures and equipment requiring hot water will have hot water readily available through the use of "in-line" all-bronze circulating pumps.

Tempered Water System: Potable cold water will be tempered by mixing domestic cold water and domestic hot water at a new master mixing valve located in the existing mechanical room to deliver tempered water to the emergency showers and eyewash stations throughout the building.

Lab Waste and Lab Vent System: Laboratory sinks in casework, chemical fume hood cup sinks and floor drains in chemical use areas will be piped in a dedicated waste system that will allow for future monitoring by regulatory authorities for possible discharges. Outside the building, after the monitoring point, the lab waste system will combine with the building sanitary sewer. Waste and vent piping will be chemical resistant.

Snow Melt System: A hydronic snowmelt system will be provided for exterior walkways at main entrances and site stairs that are difficult to access with mechanical snow removal equipment. Hydronic heat for the snowmelt system will be generated from a water-to-water heat exchanger connected to the new additions hot water heating system.

#### Materials:

Compressed Air Piping: Copper

Lab Air Piping: Copper

Lab Vacuum Piping: Copper

Lab Natural Gas Piping: Black steel

Industrial Hot/Cold Water/Tempered Water Piping: Copper

Lab Waste Piping: Polypropylene

Snowmelt Piping (buried in slab): Polypropylene

### D30 HVAC Systems- General

**Campus Chilled Water Plant:** The campus has a central chilled water plant that distributes chilled water to the buildings on campus through an underground tunnel system. The new open-source geothermal plant will be connected to the existing campus chilled water piping network, providing an ultra-high efficiency first stage of cooling and an opportunity to trade energy between this project and all other buildings on campus currently connected to the campus chilled water system, improving the overall campus energy efficiency. The new addition basement mechanical room is in close proximity to the campus tunnel and the tunnel will be extended to connect to the basement mechanical room with a 6" service for the new addition.

**Campus Steam Plant:** The campus has a central steam plant that distributes steam and condensate to the buildings on campus through an underground tunnel system. The new addition basement mechanical room is in close proximity to the campus tunnel and the tunnel will be extended to connect to the basement mechanical room with a 4" high pressure steam service for the new addition.

**Heating System:** Primary heating will be provided from campus low temperature heating water (120°F) supplied by the new open-source geothermal heating plant. Low temperature heating Water (LTHW) will be routed to this building via 6"Ø supply and return pipes. The LTHW will then be distributed through the building via fully redundant building heating water pumps. Glycol hot water solution will be piped to the air handlers, hydronic heating systems, and snow melt heat exchangers. Since the nature of the new addition is primarily heating and cooled with 100% outside air ventilation systems, radiant heating should be provided for off-hour heating requirements.

**Ventilation Requirements:** It is anticipated that the lab/shop spaces in the new addition will be 100% outside air systems with heat recovery where air quality is suitable for passing through filters and equipment. Six (6) labs with fume hoods should be located in close proximity to be zoned from the same air handling unit if practical, so that they can be efficiently ventilated 24 hours a day (minimum 6 air changes per hour in the occupied mode and 4 air changes per hour in the unoccupied mode).

**Acoustic Considerations:** Vibration isolation of pumps and compressors will be provided. Additional acoustic considerations will include limiting duct velocities through ductwork, terminal units and air inlets/outlets to achieve space NC, use of sound attenuators in the duct systems, and vibration isolation of mechanical equipment with spring isolators and flexible connections will also be employed.

**Outdoor Design Conditions:** Heating Systems will be sized for the ASHRAE median of extremes for Cheney, Washington which is -9°F. Cooling systems will be sized for the ASHRAE 0.1% design condition temperature for Cheney, Washington which is 99°F dry bulb and 69°F wet bulb.

#### **Indoor Design Conditions:**

When occupied, office and lab spaces will be maintained between 68 and 75°F.

Telecommunication rooms will control to 68-75°F 24 hours per day, 7 days per week. Mechanical and electrical spaces will control to 55-85°F.

### D3010 Energy Supply

Electrical service to the EWU Campus primary distribution system is provided by the City of Cheney.

Campus low temperature heating water and chilled water will be delivered from the GeoEco Plant. The GeoEco Plant will provide all-electric heating and cooling to the building utilizing a ground source heat pump. This new GeoEco Plant will provide higher efficiency chilled water to the building that the existing chilled water plant, and will allow energy trading between all buildings on campus that are currently connected to the existing chilled water distribution system.

Steam will be provided for laboratory steam sterilizers.

#### D3040 HVAC Distribution

**New Addition Supply:** The new addition lab/shop areas will be serviced from 100% outside air systems with heat recovery and perimeter heat (estimated at 80-85,000 cfm). Units will have supply fans, hot water heating coils, chilled water coils and filters with VAV controls and multiple fans installed in an array for redundancy. Each zone will have its own air terminal unit for regulation of airflow based upon occupied/unoccupied airflows and temperature requirements. The non-lab core spaces will be serviced from high efficiency VAV systems (estimated at 32,000 cfm) although alternative systems such as DOAS system with chilled beam terminal units should be evaluated in the design phase.

**New Addition Exhaust:** Exhaust will be ducted to exhaust fans with heat recovery at the roof level. Fans will be manifolded for partial redundancy and spaces will have pressure independent exhaust terminal units. Specialty exhaust for products of combustion such as foundry furnaces/kilns will be ducted separately out the building without heat recovery. Air will be filtered at grilles prior to entering the exhaust air terminal units of each space. Exhaust systems are anticipated to be 70-75,000 cfm.

#### **Renovation:**

Ground Floor:

Due to reconfiguration of this zone, all mechanical upgrades in this area should be considered Heavy Renovation

**Additive manufacturing:** This zone is serviced by a 22,000 cfm AHU which has 100% outside air and 100% exhaust capabilities, has too much air volume and is too energy intensive for the new proposed use. This scope should replace or rebuild existing AHU-5 and associated relief/exhaust fan to provide capacity in the 5-7,500 cfm range. Due to the industrial use of former metallics lab all ductwork in this zone should be removed and replaced with new.

**Teams room, storage, and student lounge:** Remove existing ductwork and exhaust fans including wood working exhaust systems. Provide new hot and cold duct VAV mains from existing AHU-1 in the north ground floor mechanical room and new dual duct VAV terminal units for these spaces.

**Material Science Lab, CE Construction Materials, and shared Research:** AHU-4 (10,000 cfm with 100% outside air capability) and a VFD controlled relief fan currently feeds the wood shop. Extend AHU-4 ductwork to service this zone. Provide supply and exhaust terminal units for each zone with hot water reheat from the new addition. Provide VAV controls on the supply fan. Retrofit or provide new exhaust fan for increased exhaust duct static pressure.

The existing dust collectors will not be required for the new scope and should be removed as they have had several breakdowns and should not be considered reliable for continued long term use for the expanded woodworking/construction shop areas.

Second Floor

This floor should be considered light tenant improvement work for HVAC systems and moderate

plumbing renovations in the expanded thermodynamics lab and shared research which is nearly doubling in size.

This floor is serviced by dual duct VAV air handling systems. Provide new VAV terminal units and new branch ductwork to accommodate new zoning. Modify plumbing as required for new use.

#### Third Floor

This floor should be considered light tenant improvement work for HVAC and plumbing systems.

This floor is serviced by dual duct VAV air handling systems. Provide new VAV terminal units and new branch ductwork to accommodate new zoning. Modify plumbing as required for new use. Potential scope in this zone could include relocation or removal of a sink in the existing kitchen area and potential relocation of vent pipes in walls.

Dust Collector: A dust collection system will be provided for the wood shop. The dust collector will be located on the south side of the new addition outside the shop area with access for dustbin service. Air will be filtered with final filters and recirculated back to the space for energy conservation.

Process Exhaust: Provide exhaust for point source particulates. Consider filtration units for welding that clean the air prior to recirculating back to the space.

Supply/return and non fume hood exhaust ductwork: Galvanized steel

Chemical fume hood exhaust ductwork: Stainless steel although galvanized will be considered for manifolded systems diluted with general exhaust.

#### D3050 Terminal and Packaged Units

Areas that have 24-hour process cooling loads such as the main telecommunication rooms will be serviced from dedicated standalone cooling units.

#### D3060 HVAC Instrumentation and Controls

Direct Digital Control (DDC): The project will utilize a Direct Digital Control (DDC) for the control of the HVAC systems, providing for heating and cooling control, peak load demand limiting and start/stop optimization. Damper and valve actuators will be electronic. Room thermostats will be an electronic adjustable type with override switch for occupant activation to occupied mode during unoccupied periods.

Energy Management System (EMS): The EMS controls will be compatible with EWU's campus BACnet system and existing computing and engineering facility controls manufactured by Alerton. Controls will interface and communicate with this network and front-end operator's terminal for the purpose of remote operation and maintenance. The EMS will include display and report real-time building systems performance data. The EMC controls will provide energy metering interface for the new and existing water, chilled water, low temperature heating water, steam and electric utilities servicing the existing building and new addition to a Skyspark control system.

Within the existing facility, the scope will include an upgrade of the Global Building Controller for compatibility with the new facility software. Existing supply and exhaust VAV will also be considered for controls upgrade due to cleaning issues associated with airflow measurement and improved airflow accuracy with new controllers for building pressurization.

Chemical Fume Hood Controls: Variable air volume controls shall be considered for the hoods for

acoustics and energy conservation.

#### D3070 Testing, Adjusting and Balancing

Air systems (supply, return, and exhaust), hydronic, and domestic hot water recirculation systems will be completely balanced in accordance with Associated Air Balance Council or National Environmental Balancing Bureau.

#### D40 Fire Protection

General System: The existing system will be extended from the existing building to the new addition and the addition will be sprinklered in accordance with the City of Cheney requirements.

Sprinklers: The building light hazard areas (office, lecture rooms, circulation spaces) will be sprinklered to light hazard requirements. Electrical, mechanical and non-chemical use labs will be sprinklered to ordinary hazard group 1 requirements. Labs, shops, and other higher hazard areas will be sprinklered to ordinary hazard group 2 requirements. The fire system will be divided into multiple zones by floor for identification and annunciation at the central fire alarm panel.

Standpipe: A fire protection standpipe will be required and provided at each exit stairwell if the highest occupied level of the building exceeds 30 feet above grade.

#### D50 Electrical Systems General

The building electrical systems will be designed in accordance with the latest revised edition of the following codes:

##### National Electrical Code

- International Building Code (IBC)
- International Fire Code (IFC)
- Regulations of the State Fire Marshal
- Electrical Safety Order of the Washington State Department of Labor and Industries
- Washington Administrative Code
- Americans with Disabilities Act (ADA)
- Washington State Non Residential Energy Code
- Requirements of Washington State Industrial Safety & Health Administration (WISHA)

The building electrical systems will be designed in accordance with the following standards:

- Illuminating Engineers Society of North America (IESNA)
- Eastern Washington University Construction Standards

#### D5010 Service and Distribution

Site Electrical: The existing building receives power from the existing campus 13.2KV primary electrical distribution system via existing 13.2KV Switch #1. As part of the proposed building addition, a new building service will be established at the new back of house service area. The existing service will be removed and re-fed from the new service to allow for a new building main entry from the West. The existing 13.2KV Switch #1 is loop fed from the campus primary electrical distribution system and is suitable for new service work.

Temporary Site Electrical: The existing building service transformers, generator and propane tank will require temporary relocation prior to the start of building excavation. It is proposed that this equipment be relocated North and adjacent to the existing parking lot to be outside of the excavation for the new building ground floor. This relocation will allow the existing building to remain in service during the construction of the new building. Once the new building permanent services are established, the existing building temporary services will be replaced with new

services from the new construction. The existing building telecom services from the existing tunnel are not expected to be impacted by the construction of the new building.

**Building Normal Electrical Service:** (3) new three-phase four-wire electrical services will be provided for the new building. These new electrical services will be derived from (1) new 480/277V outdoor pad mount transformer and (2) new 208/120V outdoor pad mount transformers, which will be connected to the EWU campus 13.2KV primary electrical distribution system. (2) new main switchboards will be located in a dedicated main electrical room located on the ground level. The dedicated main electrical room will be located as closely as possible to the new outdoor pad mount transformers to limit the secondary service cable length. The existing building 480V & 208V main switchboards will be refeed from the new services. The new 480V main switchboard will refeed the existing building 480V switchboard. The existing and new 208V main switchboards will each be served by a dedicated 208V service transformer.

**NEC Article 700 Emergency Electrical Distribution System:** The emergency electrical distribution system will consist of (1) 150KW, 480/277V engine driven natural gas fueled generator. The emergency electrical distribution system will be provided with an automatic transfer switch in order to automatically switch loads between the normal EWU campus power and generator backed power. The emergency electrical distribution system will supply power to all life safety systems within the building such as egress lighting, exit lighting and the fire alarm system.

**NEC Article 702 Optional Standby Electrical Distribution System:** The standby electrical distribution system will consist of (1) existing 125KW, 480/277V engine driven propane fueled generator, which will be relocated from the existing building service yard. The standby electrical distribution system will be provided with an automatic transfer switch in order to automatically switch loads between the normal EWU campus power and generator backed power. The primary intent of the standby power system is to provide generator backed power to non-life safety loads within the new building, such as fume hoods, department computer servers, telecommunications rooms (and associated cooling) and important lab equipment which is deemed critical by EWU staff.

**Building Distribution:** The building electrical distribution will originate from a main electrical room on the ground floor and feed smaller stacked electrical rooms located on each floor above. The building electrical distribution will be designed to provide separation of lighting, mechanical and computer equipment loads. Lab and special equipment power distribution will be separate from general building power panels. Because the building is being provided with separate 480/277 and 208/120V electrical services, it will not be necessary to distribute dry type step down transformers throughout the building. Multi- stage surge suppression shall be provided by installing transient voltage surge suppressors at the main switchboard, distribution switchboards and appropriate panelboard locations.

**Electric Metering:** Owner metering shall be provided for the building main electrical service equipment. Additional sub meters shall be provided for lighting, mechanical, PV system, EV charging and plug loads to allow separate metering for each end use type.

**Switchboards:** Switchboards shall be free-standing dead-front style. Main devices shall be equipped with ground fault protection. Distribution devices shall be factory-installed, group-mounted circuit breakers. Each main switchboard will have owner metering per EWU campus standards and integral TVSS protection. Switchboard shall be mounted on a 2" concrete housekeeping curb. All bus bars shall be copper.

**Panelboards:** Circuit breaker panelboards shall be provided throughout the building as required to adequately serve the associated building loads. Lab spaces will typically receive dedicated

power panels located within each lab room. Panelboards shall be dead-front circuit breaker type with proper interrupting capacity. All panelboards shall be provided with 42 available circuits and door in door construction. All bus bars shall be copper. Where appropriate, panelboards will be provided with integrally mounted TVSS units.

**Mechanical Equipment:** Refer to mechanical narrative for proposed mechanical systems and possible equipment. Motor loads ½ HP and larger will be 480V three phase. Motor starters and disconnects will typically be located in close proximity to each associated piece of mechanical equipment. Variable frequency drives will be provided by the mechanical contractor and installed by electrical contractor for various pieces of mechanical equipment.

**Shop/Lab Equipment:** Refer to the lab narrative for proposed electrical systems to be provided for each unique space. The electrical systems will be designed to provide ultimate flexibility to accommodate the ever-changing program needs for engineering studies.

**Disconnect Switches:** Safety switches shall be heavy duty type with interlocking door and spring-loaded contacts. Safety switches used as motor disconnects shall be fused. Outdoor safety switches shall be NEMA 3R.

**Engine/Generator:** Emergency and standby power generation shall be provided by means of an engine driven or natural gas fueled generator set. Each generator set shall be sized to supply the emergency and standby loads served. Emergency power will not be provided for elevator operation. Generator sets shall include a weatherproof sound attenuating enclosure for outdoor installation. Operation of the generators will be monitored on a multi function system designed to report most normal failures such as low cooling fluid temperature, low starting batteries, overcrank, overload, high water temperature, etc. The generators shall be mounted on a 6" curb to allow for maintenance access to oil drain low point.

**Automatic Transfer Switch:** The automatic transfer switches shall be 4-pole, switched neutral, open transition type.

**Medium Voltage Pad Mount Transformers:** Transformers shall contain a dead front loop feed primary compartment. Provide transformers with integral secondary disconnect switch located within the transformer secondary compartment. Provide external oil sampling valve system extended to lockable box on exterior of each transformer.

**Medium Voltage Cabling:** 15KV medium voltage cables shall be shielded, copper MV-90 single conductors. 15KV cables shall be sized in accordance with EWU campus standards and the National Electric Code and shall be installed with a 600V insulated equipment grounding conductor. 15KV cables shall be installed in continuous runs without splices.

**Medium Voltage Elbows:** 15KV medium voltage cables shall be terminated at transformers by 200 amp rated load-break elbows manufactured by Cooper.

**Grounding:** Grounding materials shall be copper, except ground rods shall be copper-clad steel. Grounding electrode shall be provided per code requirements. Equipment grounding conductors shall be run with all feeders and branch circuits. Separate grounding conductors shall be provided for isolated ground branch circuits. Equipment ground bars shall be provided within all electrical rooms and telecommunications rooms.

**On-site Renewable Energy:** A complete system of photovoltaic arrays shall be provided for on-site renewable energy generation in compliance with the Washington State Energy Code (WSEC). The

minimum system output shall be .5 watts per square foot of new building area. Potential location for solar arrays include the building roof.

#### D5020 Lighting and Branch Wiring

General Interior Lighting: Lighting throughout the interior building spaces will respond to the primary use of each space while maintaining a level of flexibility to react to future use of each space. Uniform ambient lighting will establish a basic minimum lighting level throughout each individual space with task, display and accent lighting used to establish contrast and interest. Specific attention will be given to the lighting for areas with computer workstations in order to minimize glare. Lighting within the building will be LED. Lighting system design foot candle levels will be in accordance with IES standards and EWU standards. In general, areas within the building will be illuminated to the following light levels:

| Building Area      | Foot-Candles |
|--------------------|--------------|
| General Classrooms | 30-50        |
| Labs               | 60-75        |
| Offices            | 30-50        |
| Conference Rooms   | 30-50        |
| Restrooms          | 10-15        |
| Corridors          | 10-15        |
| MEP Utility        | 10-20        |
| Storage Rooms      | 10-20        |

Egress & Exit Lighting: Exit lighting will be LED type. Emergency egress lighting will be provided throughout the path of egress and will be supplied with power from the emergency generator system in the event of a failure on the normal power system.

General Lighting Controls: Within normally occupied spaces, multi-level switching or dimming will be provided in conjunction with occupancy sensors and will utilize two or more manual wall switches. Manually dimmable lighting controls shall be utilized within appropriate areas, such as conference rooms and labs. Automatic dimming controls shall be considered for the purpose of daylight harvesting within areas where adequate natural daylight is present within the building. A programmable low voltage lighting control system shall be provided for automatic control of lighting in corridors / common areas and exterior site lighting. The low voltage lighting control system shall also be interfaced to the campus energy management system (EMS) to all EMS control of the exterior lighting.

Programmable Low Voltage Lighting Control System: Provide a distributed low voltage lighting control system with building management system interface. The low voltage lighting control system shall be manufactured by nLight (acuity brands) in accordance with EWU campus standards.

Occupancy Sensors: Occupancy sensors will be utilized to automatically shut off the lighting within offices, conference rooms, restrooms, labs and classrooms when these spaces are unoccupied. Occupancy sensors shall be dual technology type and capable of vacancy mode. Either ceiling mounted or wall mounted occupancy sensors will be utilized depending on the physical size and specific geometry of the room being controlled.

Sustainable Design Considerations: All sustainable design measures considered will be evaluated completely with regards to their associated sustainable and economic aspects. Many opportunities are currently available to construct a building that is a model of sustainable design.

The following is a brief list of items related to the building lighting and lighting control systems which are being considered for this project:

Energy efficient LED lighting will be utilized as the primary light source within the building in order to reduce the energy consumption associated with the lighting system.

Occupancy sensors will be utilized to automatically shut off the lighting within interior spaces when they are unoccupied. This will allow the interior lighting within these areas to be automatically turned off during unoccupied times, thereby increasing the available energy savings associated with the interior lighting system.

Within normally occupied spaces, multi-level switching or manual dimming will be provided in conjunction with occupancy sensors and will utilize two or more manual wall switches. The utilization of manual controls within these spaces will allow the user to reduce the light levels within their spaces if desired, further increasing the available energy savings associated with the interior lighting system.

Automatic dimming lighting controls will be considered for the purpose of daylight harvesting within areas where adequate natural daylight is present within the building. The utilization of automatic dimming and daylight harvesting will allow EWU to take advantage of the natural available daylight to the fullest extent possible. This will result in additional available energy savings associated with the interior lighting system.

A programmable low voltage lighting control system shall be used to control both the exterior and interior lighting systems. This will allow both the interior and exterior lighting systems to be automatically turned on/off at pre-programmed times, thereby increasing the available energy savings associated with the interior and exterior lighting systems.

General Exterior Lighting: Exterior lighting will be LED type selected to match the architectural building exterior and EWU campus standards. Exterior entry lighting which illuminates the path of egress will be supplied with power from the emergency generator system in the event of a failure on the normal power system. Exterior lighting will utilize full cut off light fixtures in order to avoid light trespass and meet associated dark sky lighting requirements. In general, exterior areas will be illuminated to the following light levels:

| Exterior Area     | Foot-Candles |
|-------------------|--------------|
| Exterior Entry    | 5            |
| Exterior Walkways | 2            |
| Parking Areas     | 1            |

Exterior Lighting Controls: A programmable low voltage lighting control system shall be used to control the exterior lighting. This will allow the exterior lighting to be automatically turned on and off at pre-programmed times, automatically controlled via outdoor photocell and automatically controlled by the campus EMS system.

General Branch Wiring: Provide complete raceway and wiring systems in conformance with code requirements and campus standards.

Conduit: Galvanized steel metal conduit shall be used inside building. Non-metallic conduit shall be used underground, except at transitions. Metal conduit shall be rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or flexible metal conduit. Non-metallic conduit shall be schedule 40 PVC. Conduit shall be concealed wherever possible. Minimum

conduit size is 3/4" unless otherwise noted. Conduits installed within utility tunnels shall be rigid metal conduit.

**Building Wire:** All wiring shall be copper, minimum size #12 AWG. All feeder conductors shall be installed in conduit. Aluminum conductors are not allowed on the EWU campus, unless approved by the project manager. All 480/277V and 208/120V building wire shall be color coded in accordance with EWU campus standards.

**Wiring Devices:** Switches and receptacles outlets shall be specification grade. GFI type outlets shall be provided where outlets are mounted within 6 feet of a sink. Trim plates shall be color coordinated with architect.

**Electric Vehicle Charging:** Where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

**Renovation:** (refer to architectural narrative for areas of work)

- Ground Floor – Heavy electrical work is anticipated at the ground floor of the existing building to accommodate the new programs. This would include modified electrical distribution, branch circuits, lighting, telecom, fire alarm and security.
- First Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.
- Second Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.
- Third Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.

#### D5030 Communication and Security

**Telecommunications Building Distribution:** A complete telecommunications distribution pathway and cabling system will be provided by the contractor in accordance with the EWU construction standards. Pathways, cabling, outlets and passive equipment will be provided by the contractor. Active equipment will be provided by EWU. Telecommunications rooms will be located throughout the facility in accordance with EIA/TIA 568 and 569. The main telecom room will be located on the ground floor of the building, in a centralized location. Secondary communication rooms are to be located on each floor and stacked above the main telecommunication room. Horizontal station cable pathways will be provided and routed to the telecommunications rooms located on each floor. Each telecommunications room shall be provided with a dedicated 120/208V standby power panelboard and an equipment ground bar. Selected areas will be equipped with cabling provisions for owner furnished wireless local area networking. Telecommunications riser cabling and pathways will be provided from the entrance location to the telecommunications room on each floor. Cable trays will be installed down corridors with conduits provided at hard (inaccessible) ceilings and where wall and floor penetrations are required.

**Telecommunication Outlet Distribution:** Telecommunications devices will typically be located at instructor's podiums, ceiling mounted projector locations, computer workstations and required

student locations. Offices shall typically be provided with two telecommunication outlet locations per room. Typically, each outlet will be served with two Category 6 cables.

WiFi Systems: WiFi system pathways, cabling and outlets will be provided by the contractor. Required locations for WiFi network routers will be closely coordinated with EWU. All WiFi network routers will be provided and installed by EWU.

Closed Circuit Television (CCTV) System: New CCTV System pathways and network drops will be provided by the contractor. Required locations for CCTV devices will be closely coordinated with EWU. All CCTV cameras, power supplies, cabling and active electronic equipment will be provided by EWU and installed by the contractor.

Access Control System: A complete electronic access control system will be provided for the new building. Required locations for miscellaneous access control devices will be closely coordinated with EWU. Typical spaces which will include access controls are classrooms, labs, office suites and utility rooms.

#### D5090 Other Electrical Systems

Audio / Video Systems: Audio visual systems will be provided and installed by the contractor. Spaces requiring audio visual system shall include, but not be limited to assembly spaces, classrooms and meeting rooms. The basis of design for assembly spaces and classrooms shall be a hybrid learning classroom which will include projectors, projector screens, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, lecture capture camera and device inputs. Large meeting rooms will require a projector and screen or wall mounted display, reinforced sound and control systems. Small and medium size meeting rooms will require wall mounted display and media control systems. Computer labs will be treated as basic classrooms with either projectors and screen or wall mounted displays, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, and wireless device connectivity.

Fire Alarm: A complete battery backed addressable fire alarm system with manual pull stations, automatic detection and ADA compliant horn/strobes will be provided throughout the facility. Smoke detector and heat detectors will be installed as required by the governing codes, and in accordance with EWU campus standards. The building fire sprinkler system will be monitored by the fire alarm system for system flow and shutoff valve tampering. Central reporting capabilities will be provided with the fire alarm system and shall be compatible with the existing campus fire alarm monitoring system. The new fire alarm system shall be manufactured by Edwards System Technology (EST) in accordance with EWU campus standards.

Clock System: Clock System pathways, cabling and outlets will be provided by the contractor. Required locations for clocks will be closely coordinated with EWU. All clocks and clock equipment will be provided and installed by EWU.

Room Scheduling: Room Scheduling System pathways, cabling, outlets and passive equipment will be provided by the contractor. Required locations for room scheduling will be closely coordinated with EWU. All room scheduling displays, and active equipment will be provided/installed by EWU.

Distributed Antenna System (DAS): A complete distributed antenna system for emergency responder radio use is not planned for the new building. The contractor shall provide building infrastructure for a future DAS system. Upon completion of the building structure, walls and ceilings the contractor shall provide testing for responder radio coverage.

## **E Equipment and Furnishings**

### **E10 Equipment**

#### E1010 Laboratory Fume Hoods and Other Air Containment Units

Bench-Mounted Chemical Fume Hoods: Restricted bypass type / variable air volume (VAV) extraction hoods at 100 fpm (0.51 m/s) face velocity with a vertical rising sash will be provided. Exhaust air volume will be based on 18" open sash position. Fume hood work surface will be dished epoxy resin.

Fume Extractor Arms (Snorkels): Snorkels will be 3 inch (75 mm) diameter, hinged, self-supporting air extractor arm assembly with 14" diameter clear acrylic hood.

Low Slot Exhaust: These will be custom fabricated stainless steel.

Biological Safety Cabinets: Cabinets will be Class II, Type A2, and designed to operate with an intake air velocity of 100 fpm (0.5 m/s), re-circulating the air through the supply HEPA filter into the work area.

Laminar Flow Hoods: Laminar Flow Hoods shall be equipped with supply HEPA filter and reusable prefilter to maintain Class 100 standard at work area.

Canopy Hood: Canopy Hood shall be an exhausted stainless steel canopy enclosure with all hangers and miscellaneous hardware, including damp location light fixture.

#### E1020 Laboratory Service Fittings and Fixtures

Service Fittings: Service fittings shall be chromium plated with an acid- and solvent-resistant, clear epoxy coat finish specifically designed for laboratory use. All service fittings shall be of the tapered body design with four arm handles, except for ADA accessible fittings which shall have lever handles as described below.

Fittings and fixtures: These are designated to be accessible to persons with disabilities (ADA) with operable parts shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate operable parts shall be 5 pounds (22.2 N), maximum.

Safety Stations: Safety station shall be barrier-free with emergency shower actuation valve in stainless steel cabinet for recess mounting and wall-mounted eyewash with stainless steel skirt.

Hand held eye wash: These shall be dual-purpose eye wash/drench hose, deck mounted.

Cup Sinks: Cup sinks will be epoxy and set flush with work surface, except for any cup sinks at fume hoods which will have ¼" raised rim.

Laboratory Sinks: Laboratory sinks will be epoxy for drop-in installation in work surfaces.

Stainless steel sinks: Stainless steel sinks will be Integral one piece construction with stainless steel work surface. 18 gauge (1.3 mm thick) steel unless otherwise noted.

Scrub-up sink: These shall be wall mounted 14 gauge (2.0 mm thick) Type 304 stainless steel sink with knee action control and HWCW mixing valve.

#### E1030 Laboratory Sterilizers And Washers

Laboratory Glassware Washers (as required): These shall be tall, floor mounted, front loading single door units programmable for multiple wash cycle and drying cycle duration, with purified

water rinse capability. Unit shall have mounting hardware and finish pieces for mounting through architectural wall.

Laboratory Medium Steam Sterilizers: These shall be prevacuum/gravity models with interior chamber dimensions of 20: x 36" x 48". Steam source should be provided to operate all sterilizers and Cage/Bottle Washer. Freestanding single door unit shall be cabinet enclosed. Recessed single door unit shall have mounting hardware and finish pieces for mounting through architectural wall. Pass-through double door unit shall have mounting hardware and finish pieces for mounting one end through an architectural wall.

Instruments, Controls Major Electrical Components: These shall be located in surface mount control console. Provide LCD color touchscreen microprocessor based temperature and humidity (where applicable) controller with real-time and archive trending. Each room shall be provided with reset type personnel emergency alarm with electrically powered audible and visual alarm system.

Environmental conditioning system consisting of blower(s), evaporator coil(s), heaters, humidifier (as required), refrigeration piping system and drain pans, shall be housed in modular enclosure(s) suspended from the room ceiling and shall be factory prewired to the control cabinet.

Refrigerant: Utilize non-ozone depleting refrigerants R-134a, R-404A, or approved equal; CFC type refrigerant shall not be acceptable.

Operation: Each system shall be designed and furnished in such a manner as to allow the motor compressor to operate continuously with a modulating bypass system to maintain specified temperature ranges.

Defrost: System shall incorporate an automatic defrost system.

Refrigerant Piping: All refrigeration piping required shall be furnished and installed by the controlled temperature room contractor. Provide ACR type, hard drawn, cleaned and capped Type L copper tubing with silver brazed joints.

Ventilation: provide make-up air from the laboratory space at the rate of 0.25 CFM per square foot (4.57 m<sup>3</sup>/h per square meter) unless otherwise indicated on the drawings. No ventilation air provisions shall be made for freezer rooms operating at or below 0°C.

## **E20 Furnishings**

### E2010 Laboratory Casework and Other Furnishings

Wood Casework: Wood casework shall comply with all requirements of AWI Section 400 Custom Grade architectural cabinets. Lumber shall be plain sawn oak; veneer shall be plain sliced oak. Wood casework shall be flush overlay design.

Metal Casework: Metal casework shall be of modern design and shall be constructed in accordance with the recommended practices of the Scientific Equipment and Furniture Association. All units shall be of flush overlay construction. Door and drawer heads shall be of welded, double walled steel construction, 3/4" (18 mm) thick, filled with sound deadening material.

Corrosive Storage Cabinets: Cabinets shall be vented with corrosion resistant liner designed and labeled specifically for the storage of acids and other corrosive substances, to meet code requirements

Flammable Liquid/Solvent Storage Cabinets: Cabinets shall be metal designed and labeled specifically for the storage of flammable liquids and other volatile substances, to meet code requirements.

Ventilated Storage Cabinets shall have perforated metal adjustable shelving, vent louvers inset on the lower portion of the door, and a 2" diameter PVC connection to the building exhaust system.

Laboratory work surfaces: These shall be 1" thick chemically resistant modified epoxy resin.

Stainless steel work surfaces: These shall be 16 gauge (1.6 mm thick), type 304, #4 finish with heavy mastic coating underside and perimeter timber fixing frame.

Adjustable reagent shelves: These shall be ¾ inch thick, 7-ply shop sanded exterior grade veneer plywood shelving with K+ face veneers with chemical resistant plastic laminate on all surfaces on book-end brackets mounted on double-slotted 2 inch x 2 inch fully welded square steel tube support frame. All shelves shall have 1-1/2" high safety edging.

Adjustable wall shelves: These shall be ¾ inch thick, 7-ply shop sanded exterior grade veneer plywood shelving with K+ face veneers with chemical resistant plastic laminate on all surfaces on book-end brackets mounted on double-slotted standards. All shelves shall have 1-1/2" high safety edging.

Heavy-duty shelving: These shall be 1 inch thick, 7-ply hardwood plywood with chemical resistant plastic laminate on all surfaces and edges on heavy-duty shelf standards and brackets. All shelves shall have 1-1/2" high safety edging.

Stainless steel shelving: These shall be Super Erecta stainless steel shelf system, post supported, floor mounted or wall mounted, and floor mounted high density configuration, and shall include all accessories required for function.

Open industrial metal shelf units: These shall be premium grade 20 gauge steel shelf units comprised of 5 shelves adjustable on 1" increments, 85" high 14 gauge angle post supports, and side and rear cross-bracing.

Cylinder Restraints: These shall be fabricated with Unistrut, Powerstrut or equal.

Overhead service carriers: These shall be fabricated with unistrut channels supported from structure above at 48" on center maximum and include a 14 gauge metal channel at bottom for mounting of piped services and electrical raceways.

Suspended metal channel grid: Purpose designed to support 200 lb. (0.89 kN) point load at any position and 50 lb./ft. (0.73 kN/m) uniformly distributed load. All brackets, channels, etc. (galvanized metal).

Pipe drop enclosures: These shall be an 18 gauge galvanized steel sheet enclosure with removable cover panels and epoxy paint finish.

Drying racks: These shall have a stainless steel body with white polypropylene pegs and integral drain trough with welded stainless steel trough ends.

#### E2015 Non-Laboratory Casework and Other Specialties

Casework: Typical casework provided in the student lounge and tech offices will consist of plastic laminate millwork cabinets, countertops and shelving. Fixed plastic laminate tables will be provided at the Large and Medium Classrooms.

Visual Display Boards: Tack boards and glass marker boards will be provided in classrooms and collaboration spaces.

Toilet Compartments: Provide solid phenolic core partitions that are floor-to-ceiling mount.

Window Blinds: Roller blind window coverings will be provided throughout the building, with blackout shades at labs and classrooms having video projection.

Projections Screens: Provide roll down projection screens.

Signage: Interior way-finding and room identification signage, and exterior building signage will be provided.

Bicycle Racks: Stainless steel bicycle racks will be provided.

Fire Extinguisher Cabinets: Provide recessed stainless steel fire extinguisher cabinets.

Toilet Accessories: Provide stainless steel toilet accessories.

## **F Other building construction**

No requirements.

## **G Site work**

### **G10 Site Preparation**

#### Site Preparation and Excavation

Existing Cadet Hall will be demolished for the construction of the new Engineering Building addition. Cadet Hall has an approximately 5,000-sf footprint and is two floors. Demolition will include removal of all building and foundations, capping of utility services and disposal of all materials to appropriate and legal locations.

Site preparation for the Engineering Building Addition will include removal of the existing paving and miscellaneous site features in the work area.

The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not be acceptable for use as structural fill and will be hauled off site.

#### Temporary Sediment and Erosion Control

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks on the lower site, near the Art Walk, off 7th Street.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction.

#### Temporary Construction Features

The project will require temporary construction access from the upper west parking lot, and likely also from the lower lot area to the southeast. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs. Quarry spall work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

**Construction Debris:** The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

**Foundation Subdrainage:** A footing and slab drainage system will be incorporated, and discharge into a stormwater detention system described under G30 or directly into the campus stormwater system in under then Engineering lawn. This system discharges to the City system in 7th Street. . Slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drain pipes in the free-draining layer will gravity drain to the existing campus storm system.

#### **G20 Site Improvements**

**Site Development:** The building will be accessed from the parking lot on the west side off Washington Street, and from the lower site off the southeast at the Engineering Lawn. Delivery access can be made from either side.

**Landscaping:** A combination of xeriscape planting, grass lawns, biofiltration swales (described under G30), and trees will be provided.

**Irrigation:** An irrigation system will be provided, and will be supplemented by water collected in the stormwater detention system described under G30.

#### Site Paving

Site paving will consist of asphalt and concrete per University standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces.

Asphalt for restored parking areas and new loading/utility yard off west parking , assume 6-in of ½-in HMA over 6-in crushed base.

Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement.

At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

#### Fire Truck Access

Fire truck access can be provided off the parking lot on the west side, at Washington Street and from 7th Street, via the Art Walk. There are three existing fire hydrants within a 300-foot radius of the proposed building. One off the Northwest corner of Cadet Hall appears to be in the footprint of the new addition, and should be moved (replaced) west into the parking lot.

#### Water Supply

Water mains: Existing Campus water mains are to the west, under the parking lot, and south between this site and the Art Buildings. Part of the campus main under the parking lot will need to be relocated further west to avoid the new addition west wing.

A single combined fire and domestic water service will be provided to the building from the University system water line under the west parking lot, and between the addition site and the Art Building. Alternately, the addition may be served from the existing 6-in service that enters the existing CEB from the west parking lot. Analysis from the plumbing and fire design will be required to confirm adequate flow from this 6-in connection.

Water Meter: An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria, and real-time display of building systems performance data for use by engineering courses at EWU.

#### Sanitary Sewer

All floors of the addition should be able to discharge waste by gravity to the campus sanitary sewer system located off the southeast of the site, under the engineering lawn. A new 6-in connection to this system is anticipated, approximately 150-ft of 6-in sewer pipe needed to make a new connection.

#### Stormwater Treatment and Disposal

The University's stormwater system drains to the City of Cheney's street storm system. Development of this addition will conform to the City's current surface water development manual which specifies stormwater design standards. The City has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley. Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the new storm water flow control system (detention tank). If new and replaced vehicular use pavements exceed 5,000-sf within this project, then water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

Stormwater Detention System: The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Stormwater runoff, from the roof and from adjacent new and replaced pavements, will be routed to a detention system, approximately 2,500-CF in an underground tank or vault beneath the south, upper side of the site. This detention system will discharge to the storm system at the lower site level, below the Art building and near Media Lane. Approximately 60-ft of 8-in pipe will connect it to existing systems.

Foundation Subdrainage: A footing and slab drainage system will be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drain pipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system runs southeast in Media Lane and connects to City systems at

7th Street.

#### Connection to Campus Utility Tunnel

West of the site, under the asphalt parking lot, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. A new low temperature heating water system will be installed near this building as part of the geothermal heating and cooling plant, which will be a separate project, near this building. Below grade, the new building will not directly affect the tunnel, the basement level will stop short of the tunnel walls. A short new spur off the tunnel will run into basement mechanical spaces allowing the new building to access campus utilities in the tunnel. Above grade the new addition will span over the tunnel, without bearing on it.

#### Gas Distribution

Natural gas service is provided to the existing CEB by Avista Utilities, from a service under the west parking lot. It may be possible for this service to provide for the new addition, or a new separate service to the addition provided. Gas loads from the mechanical design will determine the required path for this.

#### G4010 Electrical Distribution

The EWU Campus currently receives electrical utility power via two separate 13.2KV electrical service feeders from the City of Cheney. These two 13.2KV electrical service feeders are terminated within the EWU Rozell Substation at Campus Switchgear Bus #1 and Campus Switchgear Bus #2. Four separate 13.2KV campus feeders are routed from the Campus Switchgear to a system of 13.2KV switches located throughout the EWU campus in order to provide increased redundancy and flexibility to the campus electrical distribution system.

#### G4020 Site Lighting

Site lighting will be selected in conformance with EWU campus standards and will utilize full cut off LED light fixtures in order to avoid light trespass and meet associated dark sky lighting requirements. Site lighting which illuminates the path of egress will be supplied with power from the emergency generator system in the event of a failure on the normal power system. Site lighting will be controlled via a programmable low voltage lighting control system which will allow the site lighting to be automatically turned on and off at pre-programmed times.

#### G4090 Other Site Electrical Utilities

##### G4030 Site Communication/Data

Data/Communication service is provided to the existing building from the EWU owned data/com distribution system. Fiber optic cabling is typically routed throughout the EWU Campus via a system of cable tray that is located within the existing campus utility tunnel system. New telecommunications building service pathways will be provided and installed by the contractor. New building service pathways will be routed from the existing campus utility tunnel system into the main telecom room or be extended from the existing ground floor MDF in the existing building. Telecommunications building service cabling will be provided and installed by the contractor.

## EASTERN WASHINGTON UNIVERSITY

### PROJECT STEERING COMMITTEE

*\* Faculty and staff no longer with EWU*

Troy Bester, Sr Project Manager, Construction and Planning Services

\*Erin Ross, Director of Tribal Relations, Office of the President

\*Nydia Martinez, Dean of the College of Arts, Humanities, and Social Sciences

Mary Voves, VP-Business & Finance, Business and Finance

Laura Thayer, Assoc VP-Philanthropy Development

Erik Budsberg, PhD, Director of Sustainability, Office of Sustainability

Kris Jeske, Director of Construction and Planning, Construction and Planning Services

\*Shawn King, AVP, Facilities and Planning (retired)

### AMERICAN INDIAN STUDIES DEPARTMENT

Evanlene Melting Tallow, Program Coordinator/Recruiter

Margo Hill, , JD, MURP, Interim Director American Indian Studies, Associate Professor of Urban Planning

\*Deirdre Almeida, PhD, Director of American Indian Studies Program

Kathleen Warren, Secretary, American Indian Studies Program

### STAKEHOLDERS

Brock Belgarde, Program Manager of Archives & Records, Collville Tribes

Michele Siedenbug, Business Manager- Archeological and Historical Services

Steven Bingo, Digital Projects Archivist

### STUDENT ENGAGEMENT-NATIVE AMERICAN STUDENT ASSOCIATION (NASA)

On November 17, 2022, and February 15, 2024, many members of NASA, lead by former President Strong Heart, and current President War Bear, attended predesign engagement sessions. During these sessions students provided input related to visioning, site selection and programming as part of the predesign effort.

We wish to thank all NASA members for their time and feedback to the Predesign Team.

Section 01

# EXECUTIVE SUMMARY

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 01

# EXECUTIVE SUMMARY

Lucy Covington, a long-time tribal rights activist and Colville Tribal Council member, helped change the course of American Indian history through her courageous and selfless style of leadership. She worked with members of her own tribe and other tribes across the country to help preserve tribal sovereignty and self-determination. She also worked to protect tribal rights and resources, develop tribal services, govern the reservation for the benefit of tribe members, and promote inter-tribal cooperation.

Lucy exemplified American Indian self-determination in action and her efforts engendered a shift of U.S. policy from termination to independence and autonomy. She is considered “the most significant advocate for American Indians in the last half of the 20th century” (Mark Trahant, *The Last Great Battle of the Indian Wars*). Covington died in 1982, at age 71.

In 2015, Eastern Washington University posthumously presented an honorary doctorate to Lucy Covington and announced the creation of a student center in her name.

The proposed Lucy Covington Leadership House facility encompasses approximately 10,000 net assignable square feet (NASF) designated for community gathering, student support, and exhibition to support American Indian students. This facility will further the goals of Eastern Washington University’s Lucy Covington Initiative and their commitment to regional tribes by honoring Lucy Covington’s legacy and providing dedicated support for American Indian students.

## PROBLEM STATEMENT

American Indian students are vastly underrepresented in higher education, making up less than one percent of college students. While many factors contribute to low college attendance rates for American Indian students, most of those barriers can be traced back to a singular source: invisibility. Eastern Washington University (EWU) hopes to create a space where American Indian and non-American Indians can work together to combat invisibility of the Indigenous peoples of this region.

Declining enrollment of American Indian students is also a critical problem. American Indian student enrollment, at EWU and across the state of Washington, has declined by approximately 40 to 50 percent over the last 15 years. In contrast, other race/ethnicity groups have increased by 60 percent or more in the same time frame. The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU.

The Initiative seeks to support future leaders by honoring her legacy, educate the next generation of American Indian leaders, create a confluence of cultures and causes through community scholars and tribal leaders, and develop an archival project documenting the efforts of Lucy Covington and those who fought with her to protect sovereignty and self-determination.

The Lucy Covington Leadership House will also further the goals of Eastern Washington University’s commitment to the Memoranda of Understanding (MOU) with three regional tribes, the purpose of which is to sustain and advance relationships with EWU and construct a longhouse-style facility on campus.

Lucy Covington Leadership House will address these problems identified in its project goals:

- > Create visibility and a sense of belonging for American Indian students with a dedicated facility that supports self-exploration and self-understanding of their values, identities, cultural heritage, and career paths.
- > Improve access and retention of American Indian students by serving as a center to support their growth and development at EWU.
- > Bring together national speakers, scholars, academics, traditional practitioners, and Native leaders to share their experiences, wisdom, research, and indigenous knowledge.
- > Develop programming that promotes understanding across cultures and political boundaries to address challenges and opportunities.
- > Provide exhibit space for digital historic documents pertaining to the life and work of Lucy Covington as a part of the continued education related to the importance of protecting tribal sovereignty and self-determination.
- > Open exhibit space to local tribes, American Indian students, and artists to display their work and culture.

## ALTERNATIVES CONSIDERED

Through the predesign process, the design team considered a range of alternatives to meet the needs identified in Section 02. Alternatives that were evaluated include:

- > Preferred Alternative: Lucy Covington Leadership House (~15,000 GSF)
- > Alternative 1: Full Buildout, Preferred Alternative + Future Expansion (~33,000 GSF)
- > Alternative 2: No Action

Alternatives were evaluated in terms of advantages, disadvantages, cost, and schedule. Each alternative is summarized next.

### PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)

The conceptual program for the Preferred Alternative allocates approximately 10,000 net assignable square feet (NASF) for a total of approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering and event space, student support and collaboration areas, and an exhibit gallery and performance space.

The proposed building concept provides a speaking hall that accommodates up to 300 people for community and cultural events, a learning commons for studying and student collaboration, and an exhibit space featuring the life and legacy of Lucy Covington and American Indian Art and Culture.

The Preferred Alternative achieves many of the project's goals and addresses the identified problem.

### ALTERNATIVE 1: PREFERRED ALTERNATIVE + POSSIBLE FUTURE EXPANSION (28,000 GSF)

The full buildout alternative expands the program by approximately 8,000 NASF for a total of approximately 13,000 additional GSF. The full buildout proposes building the 15,000 GSF Preferred Alternative along with a 13,000 GSF expansion for a total buildout of 28,000 GSF.

In addition to providing cultural/community gathering and event spaces, student collaboration and support spaces, and exhibit gallery and performance spaces, the full buildout will have instructional program spaces that expand the American Indian Studies program and introduce new programs such as a Tribal Government program and dedicated Salish Language teaching space. There will be additional classrooms and faculty offices associated with this expansion.

Alternative 1 achieves and expands upon the project's goals and addresses the problems identified. Although Alternative 1 more fully achieves the project goals, it was not chosen due to the following challenges:

- > Requires additional capital funding and therefore would result in a larger capital project funding request.
- > Operational funding to expand academic programs as described above has not yet been procured.

### ALTERNATIVE 2: NO ACTION

The No Action Alternative would perpetuate the substandard quality of experience and poor retention rates for American Indian students at EWU. American Indian students would continue to have limited representation on campus and limited space dedicated to their support. They would need to continue to use the one inadequate room available in the existing American Indian Education Center building, which houses the American Indian Studies program, for meetings, studying, and socializing.

Additionally, Alternative 2 - No Action, does not fulfill EWU's strategic mission in the following ways:

- > It does not create a presence on campus for American Indian students and American Indian culture, even though there are at least four major Tribal nations in the vicinity of Eastern Washington University.
- > It does not fulfill one of the primary purposes of the Memoranda of Understandings between EWU and three Tribal Nations: to construct a longhouse-style facility that enhances recruitment and success of American Indian students.

TABLE:  
Numeric Program Summary

## PREFERRED ALTERNATIVE

### PROGRAM

The conceptual program for the Preferred Alternative allocates 15,000 GSF into a new one-story Lucy Covington Leadership House that supports the project goals. The building program focuses on three key areas that support the goals of the Lucy Covington Initiative: Community Gathering, Student Support, and Celebrating Lucy Covington’s Life and Legacy.

The building has an efficiency of 65 percent and provides the following program areas:

- > A 300-seat Speaking Hall and associated support areas.
- > A dedicated American Indian Student Center that includes a Learning Commons (student lounge, small group rooms, and makerspace), community kitchen and dining, and flexible meeting areas.
- > An exhibit hall that celebrates the life and legacy of Lucy Covington and tribal cultures.

### PREFERRED ALTERNATIVE

| PROGRAM AREA                               | NSF             | % of NSF           |
|--|-----------------|--------------------|
| <b>COMMUNITY GATHERING AREAS</b>           |                 |                    |
| Speaking Hall                              | 5,100           | 52.6%              |
| <b>AMERICAN INDIAN STUDENT CENTER</b>      |                 |                    |
| Learning Commons                           | 1,800           | 18.6%              |
| Dining Area                                | 1,550           | 16.0%              |

**DIAGRAM:**  
**Preferred Alternative: Lucy Covington Leadership House**

### SITE

For the purposes of this Predesign study, the Reid site was selected by stakeholders for the Lucy Covington Leadership House. It is directly south of Martin and Williamson Hall at the southeastern edge of the EWU campus in Cheney, Washington and is approximately 1.4 acres in size.

It is important to note that its status as the final choice may be subject to change pending updates to EWU's Campus Master Plan. As EWU moves forward with updating its Master Plan, future projects will need to align with the revised vision and objectives outlined in that plan.

### BUILDING CONFIGURATION

The Preferred Alternative concept for the Lucy Covington Leadership House is a 15,000-square-foot, one-story building. The main building entry is located off of the primary pedestrian thoroughfare on campus.

Through the vestibule, students will be welcomed into the Learning Commons, a circular lounge and student support area. This area is designed for group gatherings and collaborative activities, but also includes contemplative spots that provide areas for focused study and respite. It is surrounded by an exhibit area that will showcase Lucy Covington's life and tribal cultures.

The Learning Commons' double-height volume will integrate a skylight that will enhance natural light and provide a visual link between the sky, the occupants, and the earth, connecting building users to the natural environment.

From here, a longhouse-inspired volume can be accessed, which will be used for more formal gathering. This area contains the Speaker Hall at the south end, as well as centrally-located community kitchen and dining areas, a makerspace, and the main service core, including restrooms and building system areas.

The south and southwest edges of the site will use land-sculpting to create earthen berms. These will provide screening and casual places to sit during events, as the dining area and Speaking Hall will open onto these areas and create a more seamless indoor/outdoor experience.

**TABLE:**  
**Budget Request / Cost Summary (Top / Center)**  
**Project Schedule (Bottom)**

## PROJECT BUDGET & SCHEDULE

### PROJECT BUDGET

The state funding request for this project is approximately \$21 million, with Design funding requested in the 2025-27 Biennium and construction funding requested in the 2027-29 Biennium.

### PROJECT SCHEDULE

The anticipated project schedule for the Preferred Alternative is shown at right, and assumes design and construction funding are awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

| Agency / Institution Project Request              |                     |
|---|---------------------|
| Design / Construction Request, 2025-2027 Biennium | \$20,739,000        |
| <b>Total Project Request</b>                      | <b>\$20,739,000</b> |
| Pre-Design Report (Non-State Funds)               | \$300,000           |
| <b>Total Project Funds</b>                        | <b>\$21,039,000</b> |

| Probable Cost Estimate Summary: Preferred Alternative |                     |             |
|---|---------------------|-------------|
| Construction Cost                                     | \$16,110,800        | 77.7%       |
| Consultant Services                                   | \$2,765,000         | 13.3%       |
| Equipment   | \$643,100           | 3.1%        |
| Artwork   | \$103,200           | 0.5%        |
| Project Administration                                | \$1,117,200         | 5.4%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                             | <b>\$20,739,000</b> | <b>100%</b> |

| Project Schedule: Preferred Alternative |          |               |               |
|---|----------|---------------|---------------|
| PHASE                                   | DURATION | START DATE    | END DATE      |
| Design / Construction Funding           |          | July 2025     |               |
| Design                                  | 12 mos.  | November 2026 | November 2027 |
| Construction                            | 12 mos.  | November 2027 | November 2028 |
| Move-In / FF&E                          | 3 mos.   | November 2028 | February 2029 |
| Occupancy                               |          | February 2029 |               |

- D. What is Needed to Solve the Problem
- E. Relevant Project History

[This page intentionally left blank for the purpose of double-sided printing.]

SECTION 02

# PROBLEM STATEMENT

## A. PROBLEM IDENTIFICATION

### PROJECT OPPORTUNITY

American Indian students are vastly underrepresented in higher education, making up less than one percent of college students. While many factors contribute to low college attendance rates for American Indian students, most of those barriers can be traced back to a singular source: invisibility. Eastern Washington University (EWU) hopes to create a space where American Indian and non-American Indians can work together to combat the invisibility of the Indigenous peoples of this region.

The issue of invisibility severely impacts how non-Native individuals and organizations interact, or more importantly, avoid interacting and partnering with American Indian and Alaskan Native populations. EWU hopes to create a space where they can work together to combat the invisibility of the Indigenous peoples of this region.

Declining enrollment of American Indian students is also a critical problem. American Indian student enrollment, at EWU and across the state of Washington, has

declined by approximately 40 to 50 percent over the last 15 years. In contrast, other race/ethnicity groups have increased by 60 percent

or more in the same time frame. The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU.

Annual Enrollment Statewide by Race/Ethnicity

Annual Enrollment at Eastern Washington University by Race/Ethnicity

\*Reference: <https://erdc.wa.gov/data-dashboards/public-four-year-dashboard#annual-enrollment>

## B. STATUTORY & OTHER REQUIREMENTS

### STATUTORY & OTHER REQUIREMENTS

#### Memoranda of Understanding

The Lucy Covington Leadership House will further the goals of Eastern Washington University's commitment to the Memoranda of Understanding (MOUs) with three regional Tribes: Coeur d'Alene (July 26, 2019), Kalispel (February 12, 2018), and Spokane (April 15, 2019).

The primary purpose of the MOUs is to sustain and advance relationships between EWU and these Tribes and is summarized as follows:

- > Establish an Annual Tribal Leadership Summit.
- > Establish an American Indian Advisory Board where each Tribe has the authority to appoint one individual.
- > Recruit, retain, and successfully graduate more American Indian students.
- > Recruit, retain, and promote qualified American Indian faculty and staff to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
- > Strengthen partnerships between tribal communities and EWU academic and student support areas.
- > Plan and construct a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's Tribes, and serves as a place for cultural learning and exchange for the entire community.

Through the MOUs, the preceding priorities will receive sustained attention from EWU and the Tribes to maintain communication and address shared objectives.

The MOUs are guided in spirit by the Centennial Accord between the Federally Recognized Indian Tribes in Washington State and the State of Washington of 1989. The accord affirms the sovereignty of Washington's federally recognized tribes and calls for clearer communication and better collaboration between tribal and state governments.

For more information on the Centennial Accord, follow the link: Centennial Accord | GOIA (wa.gov).

The MOUs are included in the Appendices for reference.

#### Lucy Covington Center Repository Research Agreement

Through an ongoing partnership with the Colville Confederated Tribes that Eastern Washington University formalized in the 'Lucy Covington Center Repository Research Agreement,' EWU intends to honor Lucy Covington's legacy. The Initiative identifies the following emphasis areas: supporting future leaders; creating a confluence of culture and causes; and developing a Lucy Covington Archive.

Development on EWU campus is regulated by the Cheney Municipal Code and the 2014 EWU Comprehensive Campus Master Plan (EWU CCMP). The Campus Master Plan is being updated in 2024-2025.

## C. CONNECTION TO AGENCY MISSION, GOALS & OBJECTIVES

The EWU Strategic Plan is in draft form at the time of this Predesign publication. The following narrative demonstrates how this project is in alignment with the draft mission, goals, objectives, and desired outcomes identified.

The Lucy Covington Leadership House and Lucy Covington Initiative are part of EWU's strategic plan to increase graduation rates of underrepresented students (including American Indians).

The Lucy Covington Leadership House will support this endeavor through programs and events within the facility intended to boost enrollment and retention of American Indian students.

The Lucy Covington Leadership House aligns with EWU's mission to foster an inclusive, equitable, and transformative learning environment. American Indian students at EWU have significant barriers to accessing higher education, have a higher risk of dropping out, and lower retention rates compared to other groups. American Indian students have barriers common to first-generation, low-income, and other structurally marginalized students. EWU strives to integrate the principles of justice, equity, diversity and inclusion into all University operations to foster an environment that nurtures a sense of belonging among all members of the community.

### SENSE OF BELONGING

EWU strives to foster a profound sense of belonging, actively promote and sustain equity, dismantle systemic barriers, and embrace the unique perspectives of all individuals. As a desired outcome of this goal, the Lucy Covington Leadership House will create an important space to nurture this sense of belonging for American Indian students who often commute great distances from their reservations to be at Eastern Washington University.

### STUDENT SUCCESS AND STUDENT EXPERIENCE

Another important goal is to promote student success and close structural equity gaps through a holistic, decolonial, people-centered, value-driven approach that prioritizes student well-being in multiple dimensions and supports students' self-exploration and self-understanding of their values, identities, cultural heritages and career paths.

As a facility dedicated to empowering and supporting American Indian students, the Lucy Covington House will be a home for American Indian students' academic advising and student services, and will help them break through the systemic barriers noted above.

- > Build a virtual archive of historic documents pertaining to the work of Lucy Covington as a part of the continued research and education regarding the importance of protecting sovereignty and self-determination.

## D. WHAT IS NEEDED TO SOLVE THE PROBLEM

The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU. The initiative seeks to support future leaders by honoring her legacy, educate the next generation of Native American leaders, create confluence of cultures and causes through community scholars and tribal leaders, and develop an archival project documenting the efforts of Lucy Covington and those who fought with her to protect sovereignty and self-determination.

The Lucy Covington Leadership House will address the identified problems in its project goals:

- > Create visibility and a sense of belonging for American Indian students with a dedicated facility that supports self-exploration and self-understanding of their values, identities, cultural heritage, and career paths.
- > Improve access and retention of American Indian students by serving as a center for American Indian students to support their growth and development at EWU. It will be a center where these students can have a sense of belonging.
- > Bring together national speakers, scholars, academics, traditional practitioners, and Native leaders to share their experiences, wisdom, research, and indigenous knowledge.
- > Develop programming that promotes understanding across cultures and political boundaries to address challenges and opportunities.

## E. RELEVANT PROJECT HISTORY

There have been no previous predesign studies or capital funding requests for the Lucy Covington Leadership House.

[This page intentionally left blank for the purpose of double-sided printing.]

Section 03

# ANALYSIS OF ALTERNATIVES

A. Description of Alternatives

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 03

# ANALYSIS OF ALTERNATIVES

## A. DESCRIPTION OF ALTERNATIVES

The predesign team considered a range of alternatives to meet the needs identified in Section 02. Alternatives that were evaluated include:

- > Preferred Alternative: Lucy Covington Leadership House (~15,000 GSF)
- > Alternative 1: Full Buildout, Preferred Alternative + Future Expansion (~28,000 GSF)
- > Alternative 2: No Action

Alternatives were evaluated in terms of advantages, disadvantages, cost, and schedule. Each alternative is summarized below and on the following pages.

### PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)

The conceptual program for the Preferred Alternative allocates approximately 10,000 net assignable square feet (NASF) for a total of approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering and event space, student support and collaboration areas, and an exhibit gallery and performance space.

The proposed building concept provides a speaking hall that accommodates up to 300 people for community and cultural events, a learning commons for studying and student collaboration, and an exhibit space featuring the life and legacy of Lucy Covington and American Indian Art and Culture.

The Preferred Alternative achieves many of the project's goals and addresses the identified problem.

### ALTERNATIVE 1: FULL BUILDOUT, PREFERRED ALTERNATIVE + FUTURE EXPANSION (~28,000 GSF)

The full buildout alternative expands the program by approximately 8,000 NASF for a total of approximately 13,000 additional GSF. The full buildout proposes building the 15,000 GSF Preferred Alternative along with a 13,000 GSF expansion for a total buildout of 28,000 GSF.

In addition to providing cultural/community gathering and event spaces, student collaboration and support spaces, and exhibit gallery and performance spaces, the full buildout will have instructional program spaces that expand the American Indian Studies program and introduce new programs such as a Tribal Government program and dedicated Salish Language teaching space. There will be additional classrooms and faculty offices associated with this expansion.

**IMAGE:**  
Isle Hall

Alternative 1 achieves and expands upon the project's goals and addresses the problems identified. Although Alternative 1 more fully achieves the project goals, it was not chosen due to the following challenges:

- > Requires additional capital funding and therefore would result in a larger capital project funding request.
- > Operational funding to expand academic programs as described above has not yet been procured.

### **ALTERNATIVE 2: NO ACTION**

The No Action Alternative would perpetuate the substandard quality of experience and poor retention rates for American Indian students at EWU. American Indian students would continue to have limited representation on campus and limited space dedicated to their support. They would need to continue to use the one inadequate room available in the existing American Indian Education Center building, which houses the American Indian Studies program, for meetings, studying, and socializing.

Additionally, Alternative 2 - No Action, does not fulfill EWU's strategic mission in the following ways:

- > It does not create a presence on campus for American Indian students and American Indian culture, even though there are at least four major Tribal nations in the vicinity of Eastern Washington University.
- > It does not fulfill one of the primary purposes of the Memoranda of Understandings between EWU and three Tribal Nations: to construct a longhouse-style facility that enhances recruitment and success of American Indian students.

### **ADDITIONAL STUDY: ISLE HALL SITE LOCATION**

Site locations for the project were reviewed as part of the Predesign process, and included engagement with the Project Steering Committee, American Indian EWU students, and EWU American Indian Studies faculty.

Although not selected, the Isle Hall site was considered as a potential location due to its visibility and gateway location on campus. However, constituents voiced concerns about the level of vehicular traffic and related noise, as well as the cost impact of demolishing the existing building if it could not be retrofitted into an appropriate American Indian cultural space. The site is also limited in size and therefore would likely not accommodate both the proposed building and the significant outdoor space needed for this program, without constructing a new multi-story facility.

The Isle Hall building site still presents a promising opportunity for the project. Utilizing the Isle site could lead to significant improvements in

Campus Energy Use Intensity (EUI) and provide a pathway towards compliance with the Clean Building Performance Standard and HB1390. This aligns with EWU's commitment to sustainability, carbon reduction, and energy efficiency. The forthcoming campus decarbonization and master plan will provide guidance regarding siting optimization.

Once the project is funded, further evaluation of this site should be incorporated into the design phase.

## **A.2 ADVANTAGES & DISADVANTAGES OF EACH ALTERNATIVE**

A summary of the advantages and disadvantages of each alternative is included in the table on the following page.

**TABLE:**  
**Comparative Summary of Alternatives**

|                      | <b>Preferred Alternative:</b><br><b>Lucy Covington Leadership House</b><br>(~15,000 GSF)   | <b>Alternative 1:</b><br><b>Full Buildout, Preferred Alternative +</b><br><b>Future Expansion</b><br>(~28,000 GSF)   | <b>Alternative 2:</b><br><b>No Action</b>   |
|----------------------|--|--|---|
| <b>Est. Cost</b>     | <b>\$20,739,000</b>  | <b>\$39,177,000</b>  | No capital funding request.   |
| <b>Advantages</b>    | <p>Provides 15,000 GSF of assembly, student support and exhibit space.</p> <p>Addresses the problems defined in Section 02 and achieves the project goals.</p>   | <p>Provides 28,000 GSF of assembly, student support and exhibit space along with instructional and faculty office space.</p> <p>Addresses the problems defined in Section 02 and achieves the project goals. It expands upon these goals by expanding the instructional programs currently under American Indian Studies and adds space for a Tribal Government program, an essential program affiliated with the Lucy Covington Initiative.</p> | <p>Lower first cost.</p>  |
| <b>Disadvantages</b> | <p>Requires nearly \$21 million of capital funding from the Washington State legislature.</p> <p>Does not include instructional space for expanding American Indian Studies or create dedicated space for a Tribal Government Program.</p> | <p>Requires approximately \$39 million of capital funding from the Washington State legislature.</p> <p>Additional academic costs are also required to expand the American Indian Studies program along with academic cost to support a new Tribal Government Program. These costs have not yet been factored in by EWU. Further development is needed before programs may be expanded upon or introduced.</p>                                   | <p>Currently, the American Indian Education Center contains space dedicated to American Indian Studies program. It also offers a study area with available computers, space for meetings, activities, and socializing. It does not meet all the needs of current students.</p> <p>&gt;The limited space does not offer enough space to accommodate the number of current American Indian students who are seeking a space to connect with other American Indian students.</p> <p>&gt;Building location is not centrally located on campus, further emphasizing lack of visibility for American Indian students.</p> <p>&gt;The American Indian Studies building is not reflective of indigenous culture- neither in special organization, nor materiality, as it was originally designed as a church.</p> <p>&gt;Due to its age, the building offers very limited accessibility. The main accessible entry is on the back side of the building offering unequitable experience to students, faculty or visitors with mobility impairments.</p> <p>&gt;The quality of interior spaces is hindered by the lack of natural light, impacting student wellbeing.</p> |

**TABLES:**  
**Cost Estimate of Preferred Alternative and Alternative 1 (Top and Center)**  
**Life Cycle Cost Summary Table (Bottom)**

### A.3 COST ESTIMATES

#### PROJECT COST

Cost estimate summary information for the Preferred Alternative and Alternative 1 – Full Buildout is shown at right.

There is no imminent project associated with Alternative 2 – No Action, and therefore no project cost estimate is provided.

A detailed cost model for the Preferred Alternative is included in Appendix B.

#### LIFE CYCLE COST MODEL

Each alternative was analyzed using the Life Cycle Cost Model (LCCM) tool provided by the Office of Financial Management. A summary is shown at lower right for the Preferred Alternative and a lease option.

Additional LCCM information for the Preferred Alternative is included in Appendix B.

| Probable Cost Estimate Summary: Preferred Alternative |                     |             |
|---|---------------------|-------------|
| Construction Cost                                     | \$16,110,800        | 77.7%       |
| Consultant Services                                   | \$2,765,000         | 13.3%       |
| Equipment   | \$643,100           | 3.1%        |
| Artwork   | \$103,200           | 0.5%        |
| Project Administration                                | \$1,117,200         | 5.4%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                             | <b>\$20,739,000</b> | <b>100%</b> |

| Probable Cost Estimate Summary: Alternative 1 Full Buildout |                     |             |
|---|---------------------|-------------|
| Construction Cost   | \$30,194,600        | 77.1%       |
| Consultant Services   | \$5,349,700         | 13.7%       |
| Equipment   | \$1,286,200         | 3.3%        |
| Artwork   | \$194,900           | 0.5%        |
| Project Administration                                      | \$2,151,800         | 5.5%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                                   | <b>\$39,177,000</b> | <b>100%</b> |

| Life Cycle Cost Model Summary: Preferred Alternative Ownership Option |                 |
|---|-----------------|
| Total Gross Square Feet   | 15,000          |
| Total Rentable Square Feet  | 9,690           |
| Occupancy Date  | November 1,2028 |
| Initial Project Costs   | \$15,756,338    |
| Est. Construction TPC (\$/GSF)  | \$1,170         |
| RSF/Person Calculated   | 14              |
| 30 year Net Present Value   | \$15,781,209    |
| 50 year Net Present Value   | \$33,471,153    |

| Life Cycle Cost Model Summary: Lease Option         |                 |
|---|-----------------|
| Total Rentable Square Feet                          | 15,000          |
| Annual Lease Cost (Initial Term of Lease)           | \$469,950       |
| New Lease Operating Cost/SF (Initial Term of Lease) | \$11.61         |
| Occupancy Date                                      | November 1,2028 |
| Project Initial Costs                               | \$1,257,423     |
| RSF/Person Calculated                               | 17              |
| 30 year Net Present Value                           | \$27,695,053    |
| 50 year Net Present Value                           | \$34,764,668    |

**TABLES:**  
**Estimated Project Schedule**

## A.4 ESTIMATED SCHEDULES

A summary of the anticipated schedule for the Preferred Alternative and Alternative 1 – Full Buildout is shown at right, including anticipated start, midpoint, and completion dates.

There is no imminent project associated with Alternative 2 – No Action, and therefore no estimated project schedule is provided.

### **PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)**

The anticipated project schedule for the Preferred Alternative assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

### **ALTERNATIVE 1: FULL BUILDOUT, PREFERRED ALTERNATIVE + FUTURE EXPANSION (~28,000 GSF)**

The Alternative 1 – Full Buildout schedule also assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget. The anticipated schedule is the same as for the Preferred Alternative.

| Project Schedule: Preferred Alternative + Alternative 1 Full Buildout |          |               |               |
|---|----------|---------------|---------------|
| PHASE   | DURATION | START DATE    | END DATE      |
| Design / Construction Funding   |          | July 2025     |               |
| Design  | 12 mos.  | November 2026 | November 2027 |
| Construction  | 12 mos.  | November 2027 | November 2028 |
| Move-In / FF&E  | 3 mos.   | November 2028 | February 2029 |
| Occupancy   |          | February 2029 |               |

## SECTION 04

# DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

## A. SCOPE & PROJECT DESCRIPTION

The conceptual program for the Preferred Alternative allocates 15,000 GSF into a new one-story Lucy Covington Leadership House that supports the project goals described in Section 02, Problem Statement. The building program focuses on three key areas that support the goals of the Lucy Covington Initiative: Community Gathering, Student Support, and Celebrating Lucy Covington's Life and Legacy.

### Community Gathering

Lucy Covington Leadership House is well-suited to provide a culturally responsive center for collaboration between students, faculty, and tribal nations. With a vision of the Tribal Government Leadership program, the core element of Lucy Covington's Legacy, being established in the future, a large Speaking Hall will provide a unique American Indian multipurpose space to host speakers, performances, and community gatherings.

### Student Support

Research indicates that student services are critical to the development and success of students. The Lucy Covington Leadership House is primarily envisioned to support the success of American Indian students attending EWU.

The American Indian Student Center in the new facility will provide a "home away from home" and create a sense of community for these students, allowing for an easier transition from reservation to university. The building will have student support spaces such as a study lounge, makerspace, and collaboration areas, along with flexible meeting space that be used for drop-in counseling and advising.

### Celebrating Lucy Covington's Life and Legacy

Lucy Covington's life and legacy can be represented through the following key themes: her warm and welcoming personality, storytelling, and sense of responsibility.

Predesign engagement sessions and research indicated that Lucy Covington's story would be best commemorated by conveying her warmth and welcoming presence immediately upon entry into the building. Display and exhibition pieces will showcase Lucy's achievements alongside the achievements of other American Indian artists and regional and national leaders, emphasizing storytelling, interactivity, and self-reflection. A space for storytelling will be created through the intersection of interactive exhibits of Indigenous art, music, and performance.

The facility will honor Lucy's life by passing on her teachings and leadership legacy and imparting a sense of responsibility to young American Indians to be connected to their roots while succeeding and becoming leaders in the contemporary world.

**IMAGE:**

**Native American Student Association (NASA)  
Visioning Session with Design Team**

**PROJECT GOALS**

In alignment with EWU's Lucy Covington Initiative, the Lucy Covington Leadership House will help equip and encourage generations of American Indian youth to protect and enhance the welfare of their tribes and tackle the most pressing issues facing humanity. American Indian students are facing many challenges as they are transitioning from their reservation to navigating through higher education. Among them, the lack of visibility and representation is a significant barrier and reason for low success rates in higher education.

A primary goal of this longhouse-inspired facility is to recruit and retain American Indian students, set them up for success, and prepare them for leadership roles within their tribal communities and the wider region. In addition, the building will host opportunities for American Indian students to model leadership driven by indigenous values and follow Lucy Covington's leadership legacy, providing a steppingstone for the future leaders of tribal governments standing for tribal sovereignty.

The Lucy Covington Leadership House will serve as a foundation for building interdisciplinary partnerships, but most importantly it will center indigenous knowledge and work against the erasure of the indigenous histories. In the long term, the building will also help attract and retain leading indigenous scholars, practitioners, and leaders to share experiences, wisdom, and research through teaching and mentoring at EWU.

The Lucy Covington Leadership House will facilitate learning from history, healing, and the restoration of culture and identity of American Indians. It will be a teaching tool to support the University's Climate Action Plan and Prairie Restoration project, serving as a bridge between tradition and the future. In the long term, the facility will support the need for sustainability and climate change education.

**STUDENT INPUT TOWARDS  
PROJECT VISION**

Student engagement with EWU's Native American Student Association during the predesign process garnered input about the American Indian Student Center. The discussion fell into three key themes for students: empowerment, stewardship and University support, and reclamation.

**Empowerment:** Providing a home for American Indian students at EWU will provide the opportunity for these students to feel safe, recognized, and acknowledged on campus. It will be a place for them to connect with their heritage.

**Stewardship & University Support:** Students believe that the Center will be a great resource for all people to understand and connect with American Indian culture. As a facility that provides support for American Indian students, the project may be a catalyst toward improving access, inclusion, and retention for all students, particularly students of color and disenfranchised populations.

**Reclamation:** Students want the opportunity for more visibility on campus. The building should serve as a beacon of American Indian culture, pride and indigenous reclamation.

**SUSTAINABLE ECOLOGIES**

Buildings are responsible for some 40 percent of total annual global greenhouse emissions. To impact climate change, they must be designed sustainably from the start. Although building design is often driven by first costs, sustainable design must move beyond this approach and address the triple bottom line: economy, ecology, and equity.

True sustainability is a balance between responsible use of public resources, preservation of ecological systems, and support of societal needs. Eastern Washington University understands these imperatives and has made sustainability a central tenet of their identity and mission, which will be reflected in the Lucy Covington Leadership House.

**CHARTS:**  
**Area Allocation by Space Type**  
**Area Allocation by Program**

## A.1 NATURE OF SPACE

Lucy Covington Leadership House’s net assignable program areas have three primary functions, or space types: community gathering, exhibition, and student support.

Of the assignable building area, 53 percent is allocated for Community Gathering Areas, comprised of a Speaking Hall and its support areas, 37 percent is allocated for the American Indian Student Center, including a Learning Commons, Dining Area, and Flexible Meeting Space, and 10 percent is allocated for Exhibition Areas, including the Lucy Covington Life and Legacy Gallery.

### COMMUNITY GATHERING AREAS

#### Speaking Hall

The Speaking Hall will serve a variety of different gathering and performance functions, but its primary intent is to bring American Indians together from around the region. It will serve to hold events where indigenous knowledge is shared, and it will encourage collaboration between indigenous practitioners, scholars, and leaders from the region, nation, and international community.

The space will accommodate approximately 300 lecture-style tiered seats. The building’s spatial organization and finishes will draw inspiration from indigenous architecture, resembling a longhouse-style space. Additional Speaking Hall support areas include an audio-visual room, a green room, and designated furniture storage.

### AMERICAN INDIAN STUDENT CENTER

#### Learning Commons

The Learning Commons provides a variety of collaborative spaces to create a welcoming environment for students, mentors, staff, and visitors to engage in multiple ways. Areas include a study lounge, small group collaboration spaces, and a makerspace / open work

area. The study lounge will provide a centralized, collaboration space for American Indian students to feel at home and interact on a daily basis. The lounge will provide flexible space for approximately 40 students in soft seating and table seating areas. Small group collaboration spaces will provide places for groups to meet, study, and build community.

The makerspace/ open work area is dedicated for American Indian students’ use and provides a home for their ongoing projects. This space, sized for up to 16 students, opens out to an exterior patio to accommodate larger projects and promote visibility of American Indian culture and traditions on campus. The makerspace will support guest artists and craftsmen passing down indigenous craft and

knowledge to younger generations of American Indians. A portion of the makerspace area will integrate a flexible computer lab to support and accommodate digital projects and general homework needs.

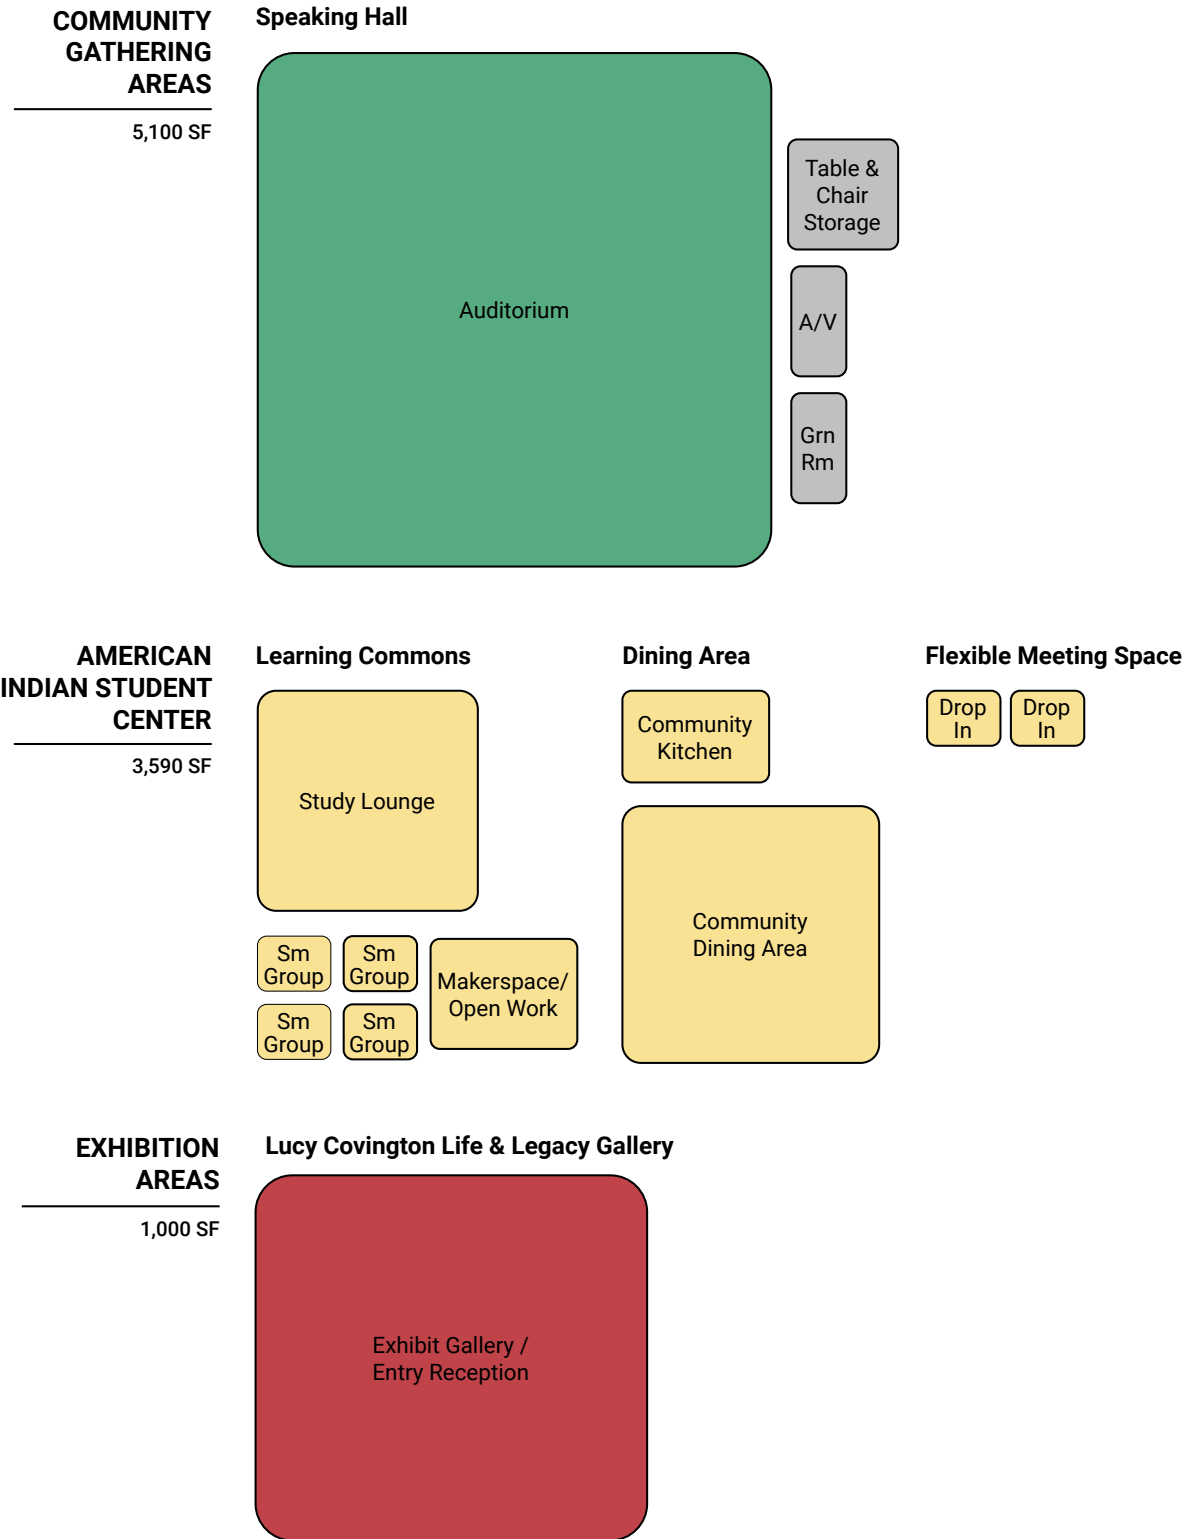

#### Community Kitchen and Dining

The Community Kitchen and Community Dining areas will serve as a focal point of the building. The kitchen will be available for use by students that are in the facility, as well as serving as a catering kitchen for functions in the building and a teaching kitchen for traditional cooking.

The dining area will accommodate up to 50 people in a variety of table seating configurations. Adjacency between these areas and the Speaking Hall will allow them to open and be used simultaneously for large functions. These

DIAGRAM:  
Program Areas

**TABLE:**  
**Building Occupancy Summary by Function**

spaces will also open to an outdoor courtyard designed to provide visual privacy.

**Flexible Meeting Space**

Two flexible meeting rooms will accommodate student functions including private and group study, drop-in counseling, and Temporary Assistance for Needy Families (TANF) counseling.

**EXHIBITION AREAS**

**Lucy Covington Life and Legacy Gallery**

Part of Lucy Covington’s essence was her warmth and welcoming persona, which will be conveyed in the exhibit gallery / entry lobby, providing an opportunity to tell the story of her achievements and capture her warmth for everyone who enters the building. The Lucy Covington Life and Legacy Gallery will empower American Indians visiting and using the building and educate non-Native students and visitors about the history and importance of Lucy Covington’s work and the history of regional tribes. This program area sets the tone for the building as a teaching tool.

Displays of local and regional tribal leaders can also be dispersed throughout the building, showcasing the diversity of tribal histories and styles. Various displays should be curated to teach through storytelling, such as using stills in combination with narration, analog displays open to visitors’ comments, interactive storytelling.

Design and displays should consider the use of natural earth elements- circles, feathers, water, animals, geometric shapes, pictographs, earth tones etc. An iconic/symbolic element such as the Eagle Feather could be an interactive feature that accommodates self-reflection and personal storytelling. Losing Eagle Feather represents losing land, which embodies the essence of Lucy Covington’s political fight and work.

| SPACE TYPE                                      | NSF           | Total OCC            | FEPG Category |
|---|---------------|----------------------|---------------|
| <b>COMMUNITY GATHERING AREAS</b>                |               |                      |               |

| <b>Total Assignable Areas</b>                   | <b>9,690</b>  |                      |               |
| <b>Total Unassignable Areas</b>                 | <b>5,310</b>  |                      | 700           |
| <b>Total Building Area</b>                      | <b>15,000</b> | <b>541 occupants</b> |               |

**A.2 OCCUPANCY**

The Preferred Alternative provides space for 541 total occupants in the building, including 347 occupants in community gathering areas and 194 occupants in the American Indian Student Center.

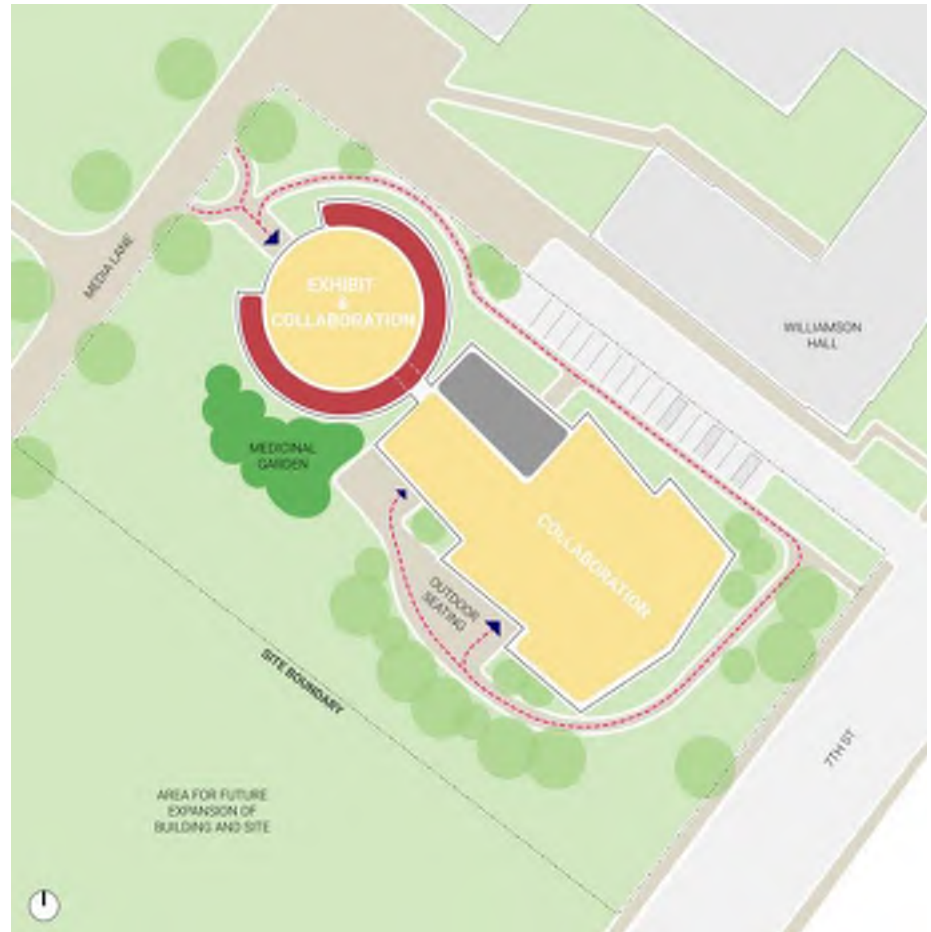

The table above identifies occupancy counts for each space type and building area.

### A.3 CONCEPTUAL BUILDING CONFIGURATION

The following description summarizes the conceptual thinking regarding building design and configuration but does not represent a final design for the building. This information is used as the basis of the predesign cost estimate and to highlight potential opportunities and challenges of the project. It is anticipated that the design team will develop the final building design in alignment with project goals, program, and budget once funding is approved.

The building form is intended to be a tribute to the tradition and culture of the Indigenous people inhabiting the Plateau. The cultural influence on the design concept in this Predesign study was a Seasonal Rounds. In practice, the weather pattern changes are significant in the Plateau Region and are indicators of the natural resources and activities change throughout the year. It is envisioned that the activities, performances and exhibits that will be held within the gallery space will reinforce this concept of seasonal change. The soft radius of this Seasonal Rounds inspired shape also defines a unique building entry on campus. The adjacent volume to the round drew inspiration from a longhouse and be configured to host community and cultural gatherings.

The Lucy Covington Leadership house is envisioned to provide a home away from home to American Indian students, who often must commute great distances from their reservations to attend EWU. It would be home for American Indian students to feel safe for their self-exploration and self-understanding of their values, identities, cultural heritages.

#### BUILDING CONFIGURATION

The Preferred Alternative concept for the Lucy Covington Leadership House is a 15,000-square-foot, one-story building. The main building entry is located off the major pedestrian thoroughfare.

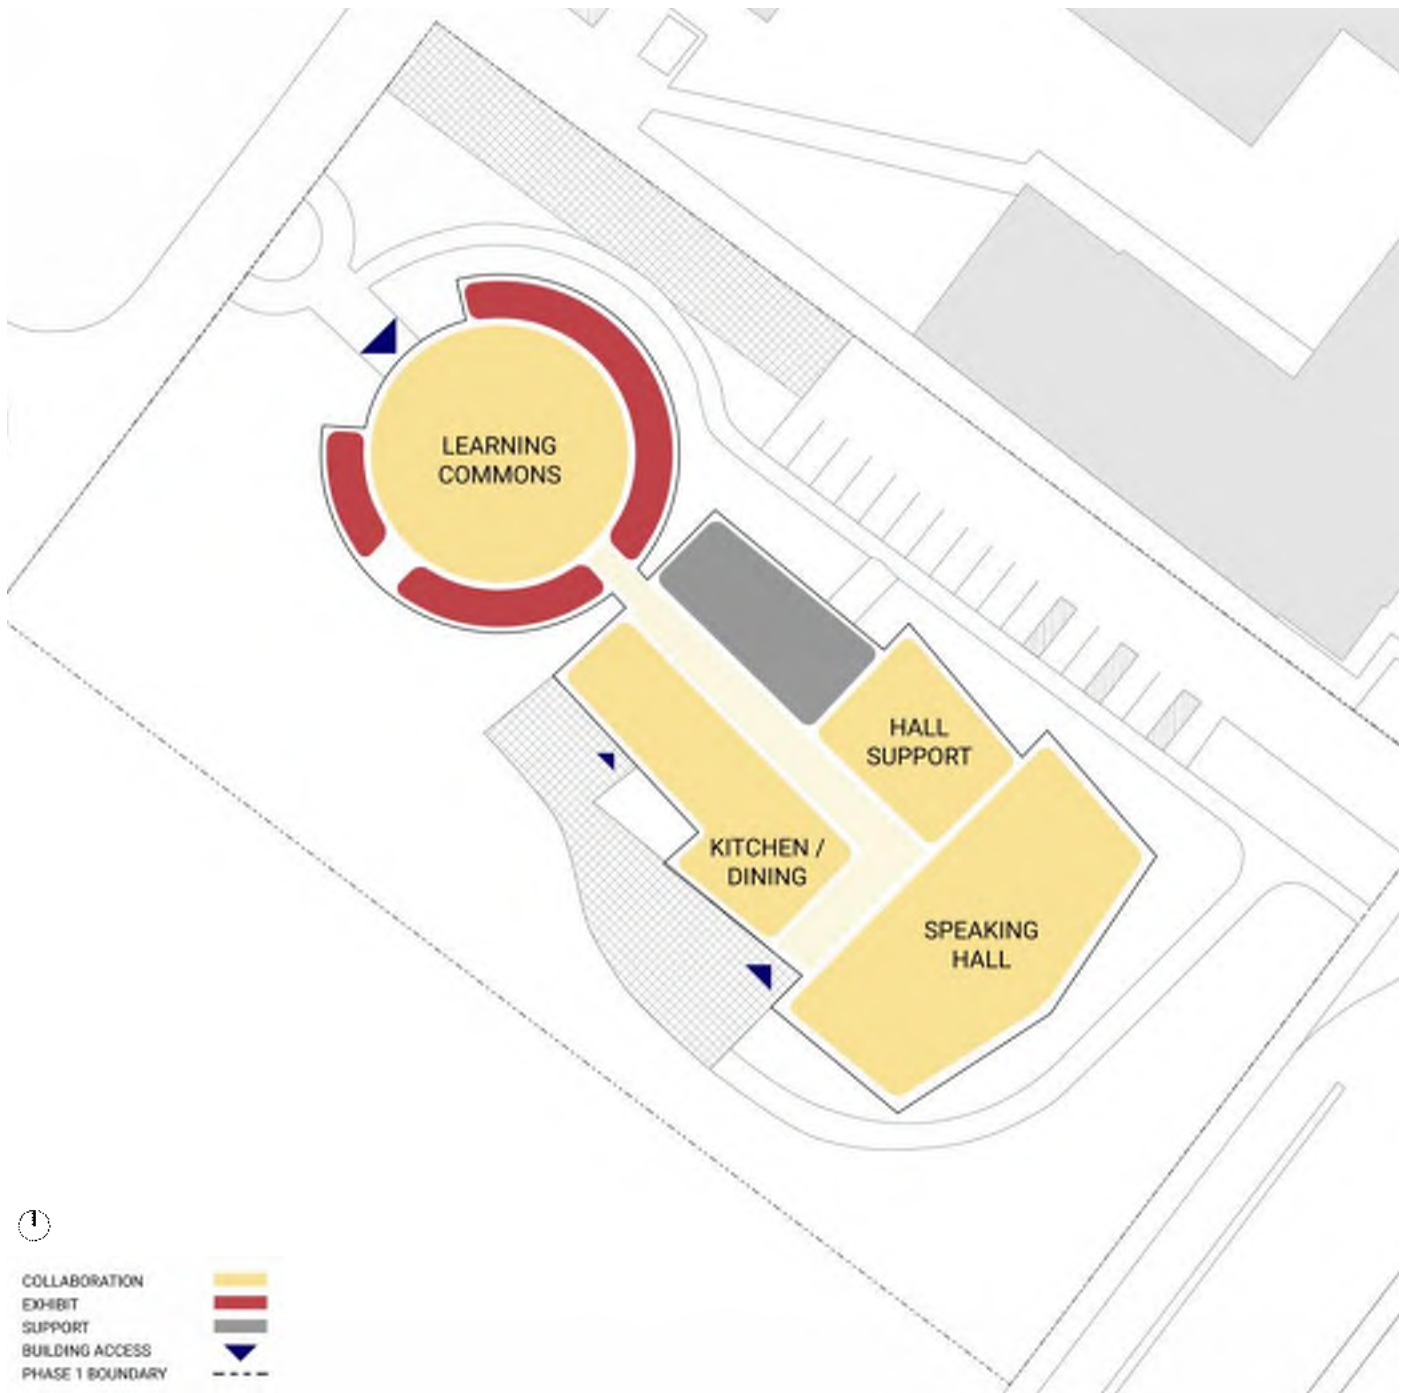

Through the vestibule, students will be welcomed into the Learning Commons, a circular lounge and student support area. This area is designed for group gatherings and collaborative activities, but also includes contemplative spots that provide areas for focused study and respite. It is surrounded by an exhibit area that will showcase Lucy Covington's life and tribal cultures.

The Learning Commons' double-height volume will integrate a skylight that will not only enhance natural light, but also provide a visual link between the sky, the occupants, and the earth,

connecting building users to the natural environment.

From here, a longhouse-inspired volume can be accessed, which will be used for more formal gathering. This area contains the Speaker Hall at the south end, as well as centrally-located community kitchen and dining areas, a makerspace, and the main service core, including restrooms and building system areas.

The longhouse is situated between the more public access road, facing Martin and Williamson Hall, and the private courtyard area. The south and southwest edges of the site will use land sculpting to create earthen berms. These will provide screening and casual places to sit during events, as the dining area and Speaking Hall will open onto these areas and create a more seamless indoor/outdoor experience.

The layering of types and sizes of exterior gathering areas is intentional so that the building’s most private space is an area set aside for a self-constructed traditional sweat lodge.

**PROGRAM CONFIGURATION**

The floor plan of the building is anticipated to contain a vibrant mix of

program areas. Spaces are organized from most public to those serving more private functions. Starting from exhibit and study lounge areas, followed by meeting and maker spaces, to communal dining and speaking hall.

The circular exhibit space will not only be utilized for exhibition, but also for sharing indigenous culture through storytelling,

performance art, and film. The nature of circular space diminishes the hierarchy and lends itself to communal activity and building strong connections. The informal seating and gathering areas, along with the dedicated meeting rooms, are encouraged to be visible from the main campus thoroughfare, while also activating the interior of the building.

EWU Campus

## A.4 SPACE NEEDS ASSESSMENT

### PROGRAM DEVELOPMENT PROCESS

The Steering Committee provided a preliminary guideline program that was used as a starting point for pre-design. Further program development was derived from an analysis of building users' needs, overlaid with the preliminary program. Information was gathered through visioning sessions with the Steering Committee, American Indian Studies program faculty, and Native American Student Association (NASA).

The design team also utilized historic program information from similar projects to establish physical facility square footage requirements. An initial "ideal" numeric program evolved from this process, outlining the desired spaces. This initial program was refined to align with the allowable program size accommodated by the allocated budget, through efficient use of space and implementation of shared usage wherever possible, while still providing necessary program functions.

Program reduction strategies included combining meeting areas, incorporating computer stations within the makerspace rather than in a separate room, and a general increase in the efficiency of the building. Desired instructional programs were not included in the Preferred Alternative program, due to lack of staffing for these programs. These instructional programs were included as part of a future expansion of the building.

The resulting building program, at 15,000 GSF, aligns with a lower budget and achieves project goals.

### IDENTIFIED NEEDS ADDRESSED IN THE PREFERRED ALTERNATIVE

Existing campus facilities do not provide the space that is needed to support the Lucy Covington Initiative and address underrepresentation and declining enrollment of American Indian students in higher education.

EWU's American Indian Education Center, shown above, houses instructional space dedicated to the American Indian Studies program and includes one room that is currently used as a student study area. While this building is significant to EWU alumni of American Indian heritage, it does not meet current student needs, support the goals of the Lucy Covington Initiative, or address underrepresentation and declining enrollment of American Indian students in higher education as follows:

- > The limited amount of space does not accommodate the current number of American Indian students or provide needed functions.
- > The existing building is not centrally located on campus, further emphasizing the lack of visibility for American Indian students.
- > The building is not reflective of indigenous culture, in its configuration or materials, as it was originally designed as a church.

- > The building has very limited accessibility. The main accessible entry is on the back side of the building, creating an inequitable experience to students, faculty, or visitors with mobility impairments.
- > The interior space students currently use the most is located in the basement and lacks natural light, impacting student wellbeing.

There is no existing space dedicated to celebrations of indigenous cultures and traditions on campus. EWU's annual Spirit of Eagle Powwow is currently held in the campus fieldhouse, which limits food preparation and is not representative of American Indian identity and culture.

The new Lucy Covington Leadership House will provide intentional and dedicated areas directly supporting the Lucy Covington Initiative and addressing the issues of underrepresentation and declining enrollment. Program areas that will support functions not currently provided on campus include:

- > Speaking Hall
- > Learning Commons
- > Dining area with community kitchen
- > Makerspace / open work area
- > Flexible meeting space
- > Lucy Covington life & legacy gallery

**TABLES:**  
**Numeric Space Program Summary (Top)**  
**Program Comparison to Guidelines (Bottom)**

**NUMERIC SPACE PROGRAM**

The proposed program for Lucy Covington Leadership House, summarized above, allocates 15,000 GSF for the building. This accommodates 9,690 square feet of assignable area, including Community Gathering Areas, Exhibition Areas, and an American Indian Student Center.

The program has a 65 percent efficiency ratio, indicating that 65 percent of the total building area is allocated for assignable program functions and 35 percent is allocated for building services, building systems, circulation, and walls.

A detailed numeric space program for Lucy Covington Leadership House is included in Appendix D.

**PROGRAM COMPARISON TO GUIDELINES**

Proposed program areas for the Lucy Covington Leadership House align with, or are more efficient than the State guidelines, as shown in the bottom table.

Other required facilities in the State Facilities Workplace Strategies and Space Use Guidelines provided in the proposed program include a Wellness room, required for facilities over 5,000 GSF.

**PREFERRED ALTERNATIVE**

| PROGRAM AREA                               | NSF             | % of NSF      |
|--|-----------------|---------------|
| <b>COMMUNITY GATHERING AREAS</b>           |                 |               |
| Speaking Hall                              | 5,100           | 52.6%         |
| <b>AMERICAN INDIAN STUDENT CENTER</b>      |                 |               |
| Learning Commons                           | 1,800           | 18.6%         |
| Dining Area                                | 1,550           | 16.0%         |
| Flexible Meeting Space                     | 240             | 2.5%          |
| <b>EXHIBITION AREAS</b>                    |                 |               |
| Lucy Covington Life & Legacy Gallery       | 1,000           | 10.3%         |
| <b>Total Assignable Square Feet (NASF)</b> | <b>9,690</b>    |               |
| <b>UNASSIGNABLE AREAS</b>                  |                 |               |
|  | <b>% of GSF</b> |               |
| Building Support                           | 6.1%            | 910           |
| Building Systems                           | 8.0%            | 1,200         |
| Circulation / Walls                        | 21.3%           | 3,200         |
| <b>Subtotal - Unassignable Areas</b>       | <b>35.4%</b>    | <b>5,310</b>  |
| <b>Total Building Area</b>                 |                 | <b>15,000</b> |
| <b>Building Efficiency</b>                 |                 | <b>65%</b>    |

| Program Area        | FEPG Guidelines  | Space Use Guidelines | Project Program |
|---------------------|------------------|----------------------|-----------------|
| Offices             | 120-175 SF each  | 100-150 SF each      | 120-150 SF each |
| Instructional Areas | 16-20 SF/station | n/a                  | 30 SF/person    |
| Conference Rooms    | 20 SF/person     | 15 SF/person         | 20 SF/person    |
| Collaboration Space | 25-35 SF/person  | 20 SF/person         | 20 SF/person    |
| Assembly Space      | 15-16 SF/person  | n/a                  | 15 SF/person    |

**IMAGE:**  
Aerial View of Project Site and Surrounding Area, EWU Campus

## B. SITE ANALYSIS

### B.1 SITE STUDIES THAT ARE COMPLETED OR UNDERWAY

Eastern Washington University will be updating its Campus Master Plan in the Fall of 2024 and targeting its completion in the Fall of 2025. As EWU moves forward with updating their Campus Master Plan, future projects such as the Lucy Covington Leadership House will need to align with the revised vision and objectives outlined in that plan.

### B.2 PROJECT SITE INFORMATION

#### LOCATION

The site selected for this Predesign study is located at the southeast edge of the EWU campus in Cheney, Washington. It is the former site of Robert Reid Lab school, which has been demolished and the site cleared in 2015. The site abuts a residential neighborhood on the other side of 7th Street.

To the northwest the site is bounded by Media Lane, a major pedestrian thoroughfare parallel to 7th Street. The large deciduous trees lining Media Lane will contribute to a project's biophilic design, provide shade in the warmer months, and allow for additional visual connectivity to the campus core during fall and winter months. On the northeast edge of the site, the Lucy Covington Leadership House building will sit parallel to Martin and Williamson Hall.

### FOOTPRINT, ADJACENCIES, & SITE FEATURES

The proposed building will be a one-story freestanding structure with a footprint of approximately 15,000 square feet. The building will occupy 25 percent of the total site area of 60,000 square feet. The site is relatively flat and covered with sparse grass. The new building will share a new access road with Martin and Williamson Hall, which will be included in the scope of the renovation of that building. Parking on the site is proposed to accommodate about sixteen stalls, including electric charging stalls and accessible parking stalls. It will also provide delivery access to the building.

#### Circulation

The major pedestrian pathway is along Media Lane, which diagonally connects the campus gateway by Isle Hall and the Art and Computer and Engineering Buildings located at the south end of campus.

Commuters arriving by bus will most commonly enter the campus via Mall Lane from Eagle Station on Elm Street. Many students, faculty, and staff arrive at EWU campus by personal vehicle. In this case, the most common entry point to campus is from Washington Street, but also off 7th Street, or via Study Lane or Quad Lane (which turns into Media Lane, bypassing our site).

Fire and service access are provided along 7th Street, Media Lane, and the new access lane shared with Martin and Williamson Hall.

### **PREFERRED ALTERNATIVE SITE CONCEPT**

During the stakeholder engagement process, this site was deemed as preferred location by the members of the Native American Student Association (NASA) over other considered site locations. The abundant outdoor space would give the building room to breathe and accommodate the many possible outdoor programs and connections that the new Center would offer. Outdoor events and gatherings should be taken into consideration for future development and by the Campus Master Plan. Choosing this prominent location on campus was of a crucial importance for elevating the visibility, presence, and importance of American Indian students and faculty members at EWU.

Based on circulation patterns, the chosen site is optimally located. The building is envisioned not only as a destination but also as a connector between the Art building and the campus core. It is also a short walking distance from the EWU's Visitor Center, Arevalo Campus Mall, and Pence Union Building.

### **WATER RIGHTS & WATER AVAILABILITY**

Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet.

Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of the tap water, backflow assemblies are installed through the campus to protect the water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements. A report is submitted to the Department of Health each year.

The water supply meets or exceeds all standards set for quality and safety, and EWU is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

### **STORMWATER REQUIREMENTS**

The proposed facility will follow the Stormwater Management Manual for Eastern Washington to meet the requirements for conveyance, flow control, and water quality treatment. It is anticipated that all stormwater will infiltrate on site but rainwater harvesting may be used towards additional LEED points. A small amount of pollution-generating impervious area, a small parking lot with an access road that will be shared with the adjacent Martin and Williamson Hall site, will be conveyed to a bio infiltration swale for water quality treatment. The bio infiltration swale will also be used for collecting the roof runoff from the building. Catch basins and piping will collect the runoff from the building and hard surface and be routed to the bio-infiltration swales.

### **OWNERSHIP OF THE SITE**

The Lucy Covington Leadership House will be located on the EWU campus, on land that is owned by Eastern Washington University. There are no acquisition issues related to this project.

### **PROPERTY SETBACK & EASEMENT REQUIREMENTS**

The project site is located in in Public (P) Zone which is applicable to the entire EWU campus. It is totally within the existing campus, with frontage on 7th Street to the southeast. The project will adhere to the setbacks specified by the City of Cheney and the building separation requirements of the current building code.

### **NEIGHBORHOOD ISSUES**

Establishing and maintaining effective communication with the campus neighbors, beginning in design, and continuing through construction, will be important given the proximity of the proposed project location adjacent to the campus boundary. As part of its construction best practices, EWU will implement communications plans and protocols to inform neighbors of construction activities and manage any communications, concerns, or complaints that may arise during construction.

### **UTILITY EXTENSION OR RELOCATION ISSUES**

The existing site currently has water and sewer service stubbed to the site as there was an existing building in the northeast corner of the lot that has been removed. The old water and sewer lines that went to an existing building will need to be removed / abandoned. There are existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building.

It is assumed the building will have fire sprinklers and will need a fire service line as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design. There also is an existing utility tunnel under the existing concrete sidewalk as well as abandoned cable lines near the site.

Existing onsite power: The proposed project site is currently serviced by Avista through underground electrical. The campus Electrical Distribution Upgrades Ph. 2, Termination Pt. #11A above grade, brings a high voltage switch location directly to the proposed Lucy Covington Leadership House site. A new feeder from the existing electrical distribution upgrade Ph. 2 at termination Pt. #11A will be installed to serve the new building. Transformer location to be coordinated during the design phase.

The utility will coordinate burial of remaining electrical overhead services and/or relocation of underground electrical. Avista and Eastern Washington Campus Officials will verify acceptable design.

### POTENTIAL ENVIRONMENTAL IMPACTS

There are no known existing environmental issues on the preferred site that need to be mitigated.

### PARKING AND ACCESS ISSUES

The campus is well served by an existing vehicular circulation network. No significant roadway or signalization improvements are anticipated on- or off-campus, given no increase in FTE capacity generated by the Lucy Covington Leadership House. Parking quantities are managed on a campus-wide basis based on periodic analysis of parking demand and use patterns.

Approximately sixteen visitors, delivery, and accessible parking stalls will be accommodated within the access road the building will share with Martin and Williamson Hall.

### CONSTRUCTION IMPACT

Eastern Washington University has demonstrated success at managing complex construction projects in its campus core and mitigating diverse impacts to surrounding areas with

multiple construction projects. Establishing adequate laydown areas, coordinating deliveries, traffic control, and contractor parking, and managing construction noise impacts, all with an emphasis on ensuring the safety of the campus community and construction workers, as well as surrounding neighbors are proven keys to success.

The following surrounding uses will be impacted during construction:

- > Adjacent area between the site and Arts Building will be used as lay-down area during construction
- > Utility installation/relocation along Media Lane and site lighting updates will have an impact on pedestrian use of Media Lane.
- > Mature trees along Media Lane will need to be protected during construction.
- > A new access road from 7th Street which will edge the project and Martin and Williamson Hall will be impacted, but fire access to JFK Library will be planned for.
- > The Drop-off area along 7th Street will be utilized by construction vehicles.

## C. CONSISTENCY WITH APPLICABLE LONG-TERM PLANS

Eastern Washington University will be updating its Comprehensive Campus Master Plan (CCMP) in the Fall of 2024 and targeting completion in the Fall of 2025. As EWU moves forward with updating its CCMP, future projects such as the Lucy Covington Leadership House will need to align with the revised vision and objectives outlined in that plan.

## D. CONSISTENCY WITH OTHER LAWS & REGULATIONS

### D.1 HIGH-PERFORMANCE PUBLIC BUILDINGS (CHAPTER 39.35D RCW)

EWU implements environmental stewardship and sustainability principles in the development and management of their buildings and capital projects. Sustainable design includes efficient management of energy and water resources, management of materials and waste, protection of health and indoor environmental quality, protection of the environment and reinforcement of natural systems, and an integrated design approach. Sustainability encompasses design, construction, operations, and demolition practices, as well as environmental, economic, and social impact.

State-funded higher education projects will be designed, constructed, and certified to at least the Leadership in Energy and Environmental Design (LEED) Silver standard under the v4.1 New Construction pathway. Lucy Covington Leadership House will achieve at least LEED Silver certification but has the goal of achieving LEED Gold. By designing to the LEED Silver or Gold standard, the College will reduce lifecycle costs (as required by OFM), thereby increasing both environmental and financial sustainability.

In addition to lowering operating costs, high-performance buildings as described in RCW 39.35D should also make occupants more productive, reduce worker absenteeism, and bolster well-being. The use of decoupled ventilation and conditioning strategies with a dedicated outside air system (DOAS), also known as energy recovery ventilators (ERV), can create healthier buildings while reducing energy use.

These systems operate with the core intent of ensuring a well-ventilated environment for student learning success. Studies have demonstrated that good ventilation is key for occupants' ability to focus and maintain concentration, while also reducing air borne pathogens to keep spaces hygienic and healthy. Both MERV 15 and carbon filtration should be employed to ensure high indoor air quality, even during forest fire seasons.

A detailed summary of the sustainability charrette that included the predesign team and EWU and outlined major sustainability strategies is included in the section 07 Supplemental Appendices.

## D.2 STATE EFFICIENCY & ENVIRONMENTAL PERFORMANCE REQUIREMENTS (EXECUTIVE ORDER 20-01)

Washington State's Executive Order 20-01 states that all newly constructed state-owned (including lease-purchase) buildings shall be designed to be zero energy or zero energy capable and include consideration of net-embodied carbon.

EWU has expressed strong interest in net zero renewable energy. Enhanced goals to achieve net zero are to be further assessed during the design phase, taking into account cost effectiveness, space constraints and environmental impact. Cost effective is defined as a simple payback of less than five years or a life cycle cost less than the baseline. A life cycle cost analysis (first cost, energy, operations, maintenance, replacement, productivity), is not necessary for measures with simple paybacks less than five years.

Electrification of the building is a key strategy to achieving net zero energy and operational carbon emissions. As the electrical grid adopts greater percentages of renewable energy sources (wind, solar, hydro, etc.), a path to decarbonize the built environment is electrification. The 2021 Washington

Energy Code will require electrification for buildings of this size and occupancy for HVAC systems and partial electrification of building domestic hot water. This will be accomplished for this project through heat pump technology via a centrally located ground source.

New buildings larger than 10,000 square feet of gross conditioned floor area, will include a renewable energy generation system consisting of not less than 0.5 W/ft<sup>2</sup> or 1.7 Btu/ft<sup>2</sup> multiplied by the sum of the gross conditioned floor area. Washington State Energy Code 2021 edition, 51-11c WAC section C411.

Based on a 15,000 GSF footprint, the solar design will need to generate 7.5kW of renewable energy. It can be anticipated to be a minimum of \$93,000.00

## D.3 STATE ENERGY PERFORMANCE STANDARDS FOR CLEAN BUILDINGS (RCW 19.27A.210)

The Lucy Covington Leadership House building project comprises less than 50,000 gross square feet of construction and is thus not a 'Covered Commercial Building' nor bound by the requirements of RCW 19.27A.210.

## D.4 ELECTRIC VEHICLE INFRASTRUCTURE (RCW 12.27.540)

Parking quantities, including number and location of electric vehicle charging stations, are managed on a campus-wide basis based on periodic analysis of parking demand and use patterns.

No additional parking will be required as part of the Lucy Covington Leadership House project, however both traffic and parking impacts will be confirmed during design process including an assessment of compliance with RCW 19.27.540.

Per RCW 19.28, where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

## D.5 GREENHOUSE GAS EMISSIONS REDUCTION POLICY (RCW 70.235.070)

EWU will reduce greenhouse gas emissions to meet and exceed the goals passed by the Washington State Legislature in April of 2009, requiring Washington State agencies reduce emissions 15 percent below 2005 levels by 2020, and 36 percent below 2005 levels by 2035. Based on their Climate Action Plan, EWU is targeting 45 percent reduction by 2030, 70 percent reduction by 2040 and 90 percent reduction by 2050. In addition, EWU is currently under contract with an engineering consulting firm to conduct a 15-year decarbonization plan that will provide a pathway(s) to transition the campus away from the use of fossil fuels for building heating, compliance with the Clean Buildings Performance Standard, and guide the new campus masterplan to prioritize sustainability in the built environment.

To achieve the GHG targets, EWU must accelerate increases in energy efficiency and reductions in GHG emissions. The nearer-term 2030 reduction target is likely achievable through available technologies and practices. Strategies for the 2030 target include:

- > Invest in infrastructure improvements to reduce energy use and GHG emissions
- > Support facilities personnel in the sustainable management and maintenance of campus
- > Use existing space efficiently

- > Avoid increasing total campus square footage
- > Carbon sequestration through the Prairie Restoration Project and management of the campus landscape
- > Install electric vehicle infrastructure for both university operations and public use
- > Electrify vehicle fleet and maintenance equipment
- > Establish a University Sustainability Committee to build stakeholder engagement and help guide EWU towards sustainable practices

As EWU looks to 2040 and 2050, the reduction targets become more challenging to plan for strategically. To achieve a 70 percent reduction in GHG, and ultimately carbon neutrality, EWU may need to utilize technologies that are not yet available at appropriate scales. These technologies may be those that are currently cost prohibitive, unproven at scale, or still in the early stages of development.

EWU can begin to anticipate potential solutions and review opportunities, but have not set a specific pathway. Therefore, current planning for 2040 and 2050 is to assess and evaluate all carbon reduction options and find sustainable solutions. Strategies for these longer-range targets include:

- > Work with EWU staff, faculty, and students to propose, research, and evaluate GHG reduction strategies
- > Collaborate with industry experts to identify opportunities to transition EWU off of natural gas
- > Investigate the role of carbon capture/sequestration from point source GHG emissions
- > Electrify where possible
- > Track and review emerging technologies/practices to reduce GHG emissions.
- > Remain open to the dynamic and evolving changes in sustainable practices and technologies to achieve the long-term carbon reduction goals

EWU's Greenhouse Gas Emission Reduction Plan incorporates multiple strategies for reducing the campus's carbon footprint. Lucy Covington Leadership House will be designed in accordance with this plan's principles and will incorporate at least eleven of the best practices to reduce greenhouse gas emissions.

When considering greenhouse gas emissions, it is also important to look at the whole life cycle carbon of buildings. This includes not only operational energy, but also refrigerant emissions, emissions from material production, and end-of-life impacts. Reducing overall emissions means minimizing operational energy use while also finding carbon sinks for projects, such as biogenic carbon from sustainably harvested wood, site landscaping, biochar, or other materials.

The use of mass timber products, such as cross-laminated timber (CLT), sequesters large amounts of carbon. Extensive research into mass timber has demonstrated that this construction type can not only reduce embodied carbon emissions by some 80 percent compared to other construction types, but it is also fast to build, fire resistive, supports local economies, and creates a healthy interior environment.

## D.6 DAHP AND TRIBAL NOTIFICATION LETTERS

As required by Executive Order 05-05, the University requested review of this project by the Department of Archaeology and Historic Preservation (DAHP) and local tribes.

The tribes that Eastern Washington University contacted fall within the federally recognized tribes of Washington and Idaho, as well as the Washington State Tribal Reservations and Draft Treaty Ceded Areas. Three tribes were contacted: the Confederated Tribes of the Colville Reservation, Spokane Tribe of Indians, and the Coeur d'Alene Tribe. Correspondence and status of communications with DAHP and local tribes are included in Appendix C.

The University will comply with requirements of the Governor's Executive Order and consult with DAHP to review the project as required for state-funded projects.

The Lucy Covington Leadership House is not anticipated to affect cultural or historic resources; however, EWU will continue to coordinate with DAHP through design to avoid or mitigate potential effects.

## D.7 AMERICANS WITH DISABILITIES ACT IMPLEMENTATION (EXECUTIVE ORDER 96-04)

The proposed project will comply with International Code Council (ICC) ANSI A117.1-2009 with Washington State Amendments - WAC 51-50. In addition to the ADA accessibility codes, the proposed facility will comply with the Revised Code of Washington (RCW) and Washington administrative code (WAC) requirements for barrier-free facilities, and the accessibility provisions of the Washington State amendments to the International Building Code.

## D.8 GROWTH MANAGEMENT ACT COMPLIANCE (RCW 36.70A)

The Growth Strategies legislation of 1990 requires state agencies to comply with local land use regulations adopted pursuant to the Growth Management Act, which EWU acknowledges through the development of 2014 Campus Master Plan (due to be updated in 2024-2025). Environmental regulations, including the Growth Management Act and local, state, and federal laws and regulations (such as shoreline and wetlands), will be met. The project will comply with all planning regulations as required by RCW Chapter 36.70A.

## D.9 INFORMATION REQUIRED BY RCW 43.88.0301(1)

The Lucy Covington Leadership House project is consistent with the EWU Campus Master Plan. No changes are proposed to the Campus Master Plan as a result of this project. This plan is consistent with City of Cheney zoning and Growth Management Act regulations.

## D.10 OTHER CODES OR REGULATIONS

All construction will comply with the applicable version of the International Building Code that is adopted by the State of Washington and the City of Cheney at the time of permit intake, as well as its reference documentation:

- > International Building Code (IBC) and Amendments – Chapter 51-50 WAC
- > International Mechanical Code (MBC) and Amendments – Chapter 51-52 WAC
- > International Fire Code (IFC) and Amendments – Chapter 51-54 WAC
- > Uniform Plumbing Code (UPC) and Amendments – Chapters 51-56, 51-57 WAC
- > Washington State Energy Code (WSEC)
- > National Electric Code (NEC)
- > Washington State Electrical - Chapter 296-46B WAC
- > Energy Codes

The 2021 Washington Energy Code or subsequently adopted version will govern the design of the new Lucy Covington Leadership House Building. RCW 39.35 requires a life cycle cost analysis of energy costs be conducted when designing a facility of this size, including analysis of building envelope, HVAC, power, and lighting.

## E. PROBLEMS THAT REQUIRE FURTHER STUDY

There are no known problems that require further study.

## F. COMPONENTS THAT EXCEED EXISTING CODE

There are no known proposed components that exceed existing code.

## G. PLANNED TECHNOLOGY INFRASTRUCTURE INVESTMENTS

The Eastern Washington University is exploring a New Geothermal Heating Plant, in addition to existing Physical Chilled Water Plant. EWU has invested heavily in this chilled water plant over the years, and it has the available capacity to serve this new Lucy Covington Leadership House building. In addition, there are pipe mains extremely close to the proposed building footprint. The project team will make use of this available source. In addition, the goal is to explore utilizing approximate 120 degree heating water for the new geothermal heating plant to reduce carbon footprint and reduce fossil fuel load of current campus steam system. New direct bury piping or tunnel construction will be required from central geothermal plant to proposed mechanical room location.

## H. PLANNED SECURITY MEASURES

The Preferred Alternative includes the following planned security measures:

- > Door hardware shall have access controls with remote lockdown capabilities.
- > A blue phone is recommended in the near vicinity of the building. Blue

phones on campus are used for mass notification and include infrastructure for video surveillance.

- > The Fire Alarm system will also have a mass notification system.

Building access and security will be managed in a similar manner as existing adjacent academic buildings

## I. COMMISSIONING

Systems commissioning, per Washington State requirements and EWU standards, will be incorporated into the project for all applicable systems. Enhanced Commissioning, requiring establishment of commissioning requirements early in the design phase, is recommended to ensure increased effectiveness of the process, and would earn LEED credit. Refer to Appendix D Electrical scope for more detailed information on Commissioning.

## J. FUTURE PHASES OR FACILITIES

Section 03A has a detailed review of the future expansion alternative. This expansion would add approximately 13,000 gross square feet to the proposed design. It would include additional office and instructional program, allowing potential expansion and/ or relocation of the American Indian Studies program.

**TABLE:**  
**Proposed Project Schedule**

## K. PROJECT MANAGEMENT & DELIVERY METHODS

### K.1 PROJECT DELIVERY METHODS CONSIDERED

Eastern Washington University intends to employ the traditional Design/Bid/Build approach for this project. Previous major capital projects at EWU have been successfully executed within or under the allocated budget using this method. Its cost-effectiveness aligns well with the regional context and the construction administration capabilities available to EWU. Currently, there is no compelling reason for EWU to seek approval for an alternative delivery method under RCW 39.10.

### K.2 PROJECT MANAGEMENT WITHIN THE AGENCY

Eastern Washington University's Construction and Planning Division will manage all aspects of the project from programming and initial budgeting of the proposed project to the initial selection of the project architect/engineer(A/E) consultant design team and throughout the subsequent design, bidding, construction, commissioning, and warranty phases.

The Construction and Planning Division will oversee the required contractual administration for the project A/E consultants and public works contractors. The Construction and Planning team is responsible for working closely with the university's administration, the design team, and the contractors to ensure the project is delivered on time and within budget.

| Project Schedule: Preferred Alternative |          |               |               |
|---|----------|---------------|---------------|
| PHASE                                   | DURATION | START DATE    | END DATE      |
| Design / Construction Funding           |          | July 2025     |               |
| Design                                  | 12 mos.  | November 2026 | November 2027 |
| Construction                            | 12 mos.  | November 2027 | November 2028 |
| Move-In / FF&E                          | 3 mos.   | November 2028 | February 2029 |
| Occupancy                               |          | February 2029 |               |

## L. PROJECT SCHEDULE

### L.1 HIGH-LEVEL MILESTONE PROJECT SCHEDULE

The anticipated project schedule for the Preferred Alternative is shown above, and assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

### L.2 VALUE ENGINEERING & CONSTRUCTABILITY REVIEW

Value engineering analysis and constructability review will be integrated into the design process. Time for this effort has been factored into the proposed project schedule.

### L.3 SCHEDULE RISK FACTORS

There are no known unusual or extraordinary factors anticipated to pose a risk to the project schedule. During the design and construction phases, the project team will need to manage typical factors and processes that have the potential to impact schedule, such as entitlements and jurisdictional review time.

### L.4 PERMITTING, ORDINANCE, OR NEIGHBORHOOD ISSUES

Buildings on EWU's campus are subject to the governing codes of the City of Cheney. During the design process, the University and design team will meet with City officials as required to ensure the project conforms with all City requirements.

### L.5 JURISDICTIONAL PROCESS & COMMUNITY INVOLVEMENT

Regular engagement with the City of Cheney, to understand permitting requirements and identify any other ordinances that could impact schedule, will be arranged. The involvement of the stakeholders, such as a Steering Committee, American Indian Studies program faculty members, and Native American Student Association (NASA) members will continue throughout the design.

## SECTION 05

# PROJECT BUDGET ANALYSIS FOR PREFERRED ALTERNATIVE

## A. COST ESTIMATE

A construction cost estimate based on the Maximum Allowable Construction Cost (MACC) cost estimate was prepared by the consultant. The State of Washington's C-100 (2024) cost estimating model was used as the basis for this estimate, applying consultant and project management fees, contingencies, and escalation.

The Preferred Alternative project budget is \$20,739,000, escalated based on the proposed project schedule. A construction cost summary is included on the following pages.

The State of Washington Form C-100 summary, which includes project and construction costs, is included later in this section. Additional cost detail is included in Appendix B, Detailed Cost Model.

## A.1 MAJOR ASSUMPTIONS

The following assumptions were used as the basis for the construction cost estimate indicated below.

- > Design, Bid, Build delivery method is assumed.
- > Assumes a Q4, 2027 start and a 12-month schedule for the Preferred Alternative.
- > Estimate excludes soft costs such as design fees, permits, testing / inspections, construction change order contingencies, loose fixtures / furnishings and sales tax.

**TABLE:**  
**Construction Cost Estimate:**  
**New Construction**

## A.2 COST ESTIMATE SUMMARY

A summary of the construction cost estimate for the Preferred Alternative is shown below and on the following page. A detailed cost estimate is included in Appendix B.

### ESTIMATED COSTS SUMMARY

June 4, 2024

| Item   | Description                           | QTY    | UOM  | \$ / UOM      | Cost                 |
|--|---------------------------------------|--------|------|---------------|----------------------|
| 1  | BUILDING - PREFERRED OPTION           | 15,000 | BGSF | \$ 649.89     | \$ 9,748,406         |
| 2  | SITWORK                               | 60,000 | SGA  | \$ 29.77      | \$ 1,786,495         |
| 3  | General Conditions & Support Services | 12     | MO   | \$ 75,000     | \$ 900,000           |
| <b>Total Estimated Construction Cost (Today's Dollars)</b> |                                       |        |      |               | <b>\$ 12,434,902</b> |
| 4  | Escalation to Midpoint (Q2, 2028)     | 16.00% | on   | \$ 12,434,902 | \$ 1,989,584         |
| <b>Total Construction Cost (Escalated)</b>                 |                                       |        |      |               | <b>\$ 14,424,486</b> |

## C. OPERATIONS & MAINTENANCE REQUIREMENTS

### C.1 OPERATING BUDGET IMPACT

The projected annual operating budget for the first year of operation in FY2029 is \$234,900. The budget will cover utilities, groundskeeping, pest control and other site maintenance, along with general building maintenance that includes security and telecommunications support.

Other costs include building operation permits for the building and components, such as elevator and pressure vessels, and specialized maintenance service contracts, such as elevators and fire sprinkler testing. The budget will also include general management of the facility, moving costs for the first year, and subsequent moving expenses throughout the life of the building.

### C.2 CAPITAL & OPERATING COSTS

The first biennium at building occupancy is FY29-31. The operating and maintenance cost, including building preservation and replacement based on funding, is \$234,900 for FY29. Escalation from that point is assumed at 3.00 percent per year.

Total capital and operating costs for the five biennia amount to approximately \$2.7 million.

### C.3 MAINTENANCE & OPERATIONS AGENCY

The Lucy Covington Leadership House will receive EWU’s current campus level of custodial services and building utilities maintenance. Current and future operations and maintenance costs will be funded from EWU’s normal operations and maintenance funding.

Current campus operations and maintenance costs for FY24 are shown in Table 1 above. For the Lucy Covington Leadership House, the projected operations and maintenance costs for the first full year of occupancy (FY2029) are \$234,900. Table 2 shows projected costs for FY29 through FY38.

## D. FURNITURE, FIXTURES & EQUIPMENT

Estimated funds for furniture, fixtures, and equipment are included in the project budget.

# APPENDICES

- A. Predesign Checklist
- B. Cost Analysis
- C. DAHP & Tribal  
Correspondence
- D. Project Detail

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 06 APPENDICES

### A. PREDESIGN CHECKLIST

#### B. COST ANALYSIS

- B.1 Form C-100
- B.2 OFM Life Cycle Cost Model
- B.3 Detailed Cost Model

#### C. DAHP & TRIBAL CORRESPONDENCE

- C.1 Status of Tribal Liaison
- C.2 DAHP Correspondence
- C.3 Tribal Correspondence

### D. PROJECT DETAIL

- D.1 Detailed Space Program
- D.2 Architectural Basis of Design Narrative
- D.3 Civil Basis of Design Narrative
- D.4 Landscape Basis of Design Narrative
- D.5 Structural Basis of Design Narrative
- D.6 Mechanical and Plumbing Basis of Design Narrative
- D.7 Electrical, Telecom & Security Basis of Design Narrative

## SECTION 06

## APPENDIX A: PREDESIGN CHECKLIST

## EXECUTIVE SUMMARY

## PROBLEM STATEMENT, OPPORTUNITY, OR PROGRAM REQUIREMENT

- Identify the problem, opportunity or program requirement that the project addresses and how it will be accomplished.
- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals and objectives; statutory requirements; and the problem, opportunity or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

## ANALYSIS OF ALTERNATIVES (INCLUDING THE PREFERRED ALTERNATIVE)

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost Model (RCW 39.35B.050).
  - Schedule estimates for each alternative. Estimate the start, midpoint and completion dates.

## DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

- Nature Of Space
  - Community Gathering Areas
  - American Indian Student Center
- Occupancy
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site Analysis
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floor plans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
- Consistency With Applicable Long-Term Plans
- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter 39.35D RCW).

- State efficiency and environmental performance, if applicable (Executive Order 20-01).
- State energy standards for clean buildings (RCW 19.27A.210).
- Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW 19.27.540).
- Greenhouse gas emissions reduction policy (RCW 70.235.070).
- Archaeological and cultural resources (Executive Order 05-05 and Section 106 of the National Historic Preservation Act of 1966).
- Americans with Disabilities Act (ADA) implementation (Executive Order 96-04).
- Compliance with planning under Chapter 36.70A RCW, as required by RCW 43.88.0301.
- Information required by RCW 43.88.0301(1).
- Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative.
- Describe how the project will be managed within the agency.
- Schedule.
  - Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
  - Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW 43.88.110(5)(c).
  - Describe factors that may delay the project schedule.
  - Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
  - Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

#### **PROJECT BUDGET ANALYSIS FOR THE PREFERRED ALTERNATIVE**

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The C-100.
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
- N/A If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

#### **PREDESIGN APPENDICES**

- A. Predesign Checklist.
  - B. Completed Life Cycle Cost Model.
  - C. DAHP Letter.
- N/A Title report for projects including proposed acquisition.

**SECTION 06**

# APPENDIX B: COST ANALYSIS

## B.1 FORM C-100

The complete Form C-100 is included on the following pages.

## STATE OF WASHINGTON AGENCY / INSTITUTION PROJECT COST SUMMARY

SECTION 06

# APPENDIX C: DAHP & TRIBAL CORRESPONDENCE

## C.1 STATUS OF TRIBAL LIAISON

Eastern Washington coordinated with the Department of Archaeology and Historic Preservation (DAHP) to verify and confirm tribes to contact regarding the Lucy Covington Leadership House.

The tribes that EWU was required to contact fall within the Federally Recognized Tribes of Washington State and the Washington State Tribal Reservations and Draft Treaty Ceded Areas.

The following tribes were contacted:

- > Confederated Tribes of the Colville Reservation
- > Coeur d'Alene Tribe
- > Spokane Tribe of Indians

## C.2 DAHP CORRESPONDENCE

Correspondence from DAHP regarding the Lucy Covington Leadership House Predesign is included on the following page.

## C.3 TRIBAL CORRESPONDENCE

Correspondence regarding the Lucy Covington Leadership House Predesign was sent to the tribal representatives listed below. Letters to each tribe are included on the following pages.

### > **Confederated Tribes of the Colville Reservation**

Guy Moura,  
Tribal Historic Preservation Officer

### > **Coeur d'Alene Tribe**

Jill Maria Wagner, PHD,  
Tribal Historic Preservation Officer

### > **Spokane Tribe of Indians**

Randy Abrahamson,  
Tribal Historic Preservation Officer

Allyson Brooks Ph.D., Director  
State Historic Preservation Officer

June 13, 2024

Troy Bester  
Senior Project Manager  
Construction and Planning Services, EWU

In future correspondence please refer to:  
Project Tracking Code: 2024-06-04182  
Property: Lucy Covington Leadership House - EWU Cheney Campus  
Re: No Historic Resources Impacted

Dear Troy:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Officer (SHPO) under provisions of Governor's Executive Order 21-02. Our review is based upon documentation provided in your submittal. Please note this review is for the predesign phase of the project only.

It is our opinion that no historic resources will be impacted by the current project as proposed.

As a result of our opinion, further contact with DAHP on this proposal is not necessary. However, if new information about affected resources becomes available and/or the project scope of work changes significantly, please resume consultation as our assessment may be revised. Also, if any archaeological resources are uncovered during construction, please halt work immediately in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A  
Architectural Historian

RE: Propose Project at Eastern Washington University  
Lucy Covington Leadership House  
EWU Project No. CP1112

Mr. Moura,

This letter is to notify you of a proposed project, Lucy Covington Leadership Center, on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the university will be submitting a predesign report for state review/approval of the project on June 30, 2024.

The building is proposed as a single-story structure totaling approximately 15,000 gross square feet. The Lucy Covington Leadership House will be a center to support the success of Native American students at the university and beyond. It will provide a location focused on creating a sense of community for these students allowing for an easier transition from their home to the university setting. The facility brings together cultural/community gathering & event spaces, student collaboration & support spaces, and exhibit gallery & performance spaces.

The initial site proposed for construction will be located entirely on the previously disturbed ground of the demolished Reid Laboratory School. Reid School was demolished in 2016. Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving parking and landscaping. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Sincerely,

Troy Bester  
Senior Project Manager

**TABLE:**  
Minimum R-Values & U-Values for Exterior Component Type

## D.2 ARCHITECTURAL BASIS OF DESIGN NARRATIVE

### PROJECT DESCRIPTION

Construction of a new 1 story community gathering, student center and exhibit hall building at Eastern Washington University. The selected site for the Predesign analysis was the Reid Hall site immediately south of Martin Williamson Hall.

### JURISDICTION

Anticipated Applicable Codes:

- > Building: 2021 International Building Code, with Washington State Amendments, Chapter 51-50 WAC.
- > Mechanical: 2021 International Mechanical Code, Chapter 51-52 WAC.
- > Plumbing: 2018 Uniform Plumbing Code, Chapter 51-56 and 51-57 WAC.
- > Electrical: 2020 National Electric Code (NFPA 70), Chapter 296-46B WAC.
- > Fire: 2018 Washington State Fire Code, with Washington State Amendments
- > Energy Code: 2021 International Energy Conservation Code (IECC) and Amendments, Chapters 51-11C and 51-11R WAC.
- > Accessibility: ICC A117.1-2017 Standard for Accessible and Usable Buildings and Facilities.
- > Building height and other planning regulations are governed by City of Cheney Municipal Code and Title 21 Zoning.

The project is required to submit for the State Environmental Policy Act (SEPA).

The roughly 15,000 sf building will be mixed occupancy of Assembly Group A3 as defined by the International Building Code (IBC). The building will be fully NFPA 13 sprinklered.

**Construction Type:** V-B

**Allowable Building Height based on Construction Type:** 60'

| Component        | 2021 WSEC       |
|------------------|-----------------|
| Foundation       | R-10 for 2 ft   |
| Basement Wall    | R-13 batt + R10 |
| Exterior Walls   | R-13 batt + R10 |
| Exterior Soffits | R-38 batt + R10 |
| Roof             | R-38 ci         |
| Glazing          | U-0.34          |
| Glazing %        | 30% max         |
| Doors            | U-0.34 (glazed) |
| HVAC             | Calculated      |

**Allowable number of Stories above Grade:** 2

**Allowable area per floor (A-3 occupancy):** 24,000 (S1-single story), 18,000 (multi-story) 38,000 (S1-single story)

Fire-resistance rated construction is largely not anticipated. The exception will be shafts and egress stairs.

### GREEN BUILDING STANDARD

**LEEDv4 Certified Silver BD+C minimum, Certified Gold BD+C preferred:**

- > Website: <https://www.usgbc.org/resources/leed-v4-building-design-and-construction-current-version>

**Washington State Clean Buildings Act alignment:**

- > Website: <https://www.commerce.wa.gov/growing-the-economy/energy/buildings>

### BUILDING SYSTEMS AND COMPONENTS

#### BUILDING ENVELOPE

A continuous self-adhered air and weather resistive barrier will cover the entire exterior sheathing. Thermal bridges are to be minimized and all penetrations of the exterior air barrier will be fully sealed. The exterior enclosure will be constructed to achieve a maximum air-leakage rating of 0.17 cfm/ft at 0.3 inches water gauge. The building will be blower door tested to demonstrate conformance.

#### Exterior Walls:

Exterior walls will be of non-bearing light gauge steel stud or may be wood studs for Type V-B. have R-24 fiberglass batt insulation filling the cavities between studs. In addition, there will be a minimum of 2 inches of continuous exterior mineral board insulation.

- > Clear Cedar

At select locations, the use of wood siding and particularly cedar will be used. This is recommended to be under covered areas or protected from exposure. Where exposed, it shall have a durable exterior clear or semi transparent sealer with wood products dipped and coated on all sides with the sealer.

- > Metal Panels

At select locations, Composite wall panels with concealed clips and/or fasteners over a thermally broken fiberglass clip or rail system to attach the building cladding back to the exterior wall structure

#### Exterior Windows:

Aluminum Storefront System

- > Basis of Design: Aluminum framed, Kawneer Trifab 451UT thermally broken.
- > Glazing: 1-inch double-pane Solarban 70 glazing with low-e coating on 2 surfaces, argon filled, or similar; code compliant.
- > Finish: High-performance Kynar coating, Dark Bronze.
- > Flashing: Prefinished aluminum to match.

**TABLE:**  
**Proposed Interior Finishes for Basis of Design**

| Program Area Types   | Floors                        | Walls                                    | Ceilings   |
|--|-------------------------------|--|--|
| Speaking Hall  | Wood Gymnasium grade flooring | Level 4 GWB<br>50% Acoustical Treatment  | Open to structure (CLT).<br>50% Acoustical treatment |
| Learning Commons   | Carpet                        | Level 4 GWB<br>30% Acoustical Treatment  | Open to structure (CLT).<br>50% Acoustical treatment |
| Dining Area  | Polished Concrete             | Level 4 GWB<br>50% Acoustical Treatment  | Open to structure (CLT).<br>50% Acoustical treatment |
| Exhibit Areas  | Wood Gymnasium grade flooring | Level 4 GWB<br>30% Acoustical Treatment  | Open to structure (CLT).<br>50% Acoustical treatment |
| Building Support incl:<br>Storage, Receiving ,<br>Custodial, MEP | Sealed Concrete               | Level 3 GWB                              | Open to structure.                                   |
| Circulation - Hallways   | Polished Concrete             | Level 4 GWB                              | Open to structure (CLT).                             |
| Restrooms  | Floor Tile                    | Wall Tile up to 7' on all wall surfaces. | GWB  |

**Exterior Openings:**

Exterior doors will be thermally broken, aluminum framed. Exterior doors at main entries will be fully accessible and have bollard mounted ADA push button paddles to operate motorized door openers.

Exterior louvers will be located as high off the ground as possible for security purposes. Their construction should be fully tamper-resistant and capable of preventing ingress. Louvers will be prefinished, or field painted to match adjacent finishes, factory fabricated and complete with frame, mullions and insect screens.

**Roofing:**

Low sloped roofs will be insulated to an average value of R-49 with continuous exterior board insulation located above the roof deck. Insulation will be mechanically fastened over a self-adhered vapor barrier over protection board and roof sheathing. Fleece-backed TPO (thermoplastic polyolefin) will be used as the roof membrane and be a minimum 80-mil thickness. Water will be directed to a series of roof scuppers, conductor heads and downspouts for drainage and potential on-site water storage facility.

- > Sloped roof will be at a 3:12 slope and clad with Metal Roof Panels:
- > Profile: 24 Gauge Standing Seam with minimum 1" seam height and concealed fastener system.
- > Texture & Finish: Smooth, Fluoropolymer Coil Coating System.
- > Snowguard: Continuous Fence type snow guard attached to standing seams with aluminum clamps.

Fall protection system will be a roof tie down system with Roof Anchors.

**INTERIORS**

**Casework:**

Casework throughout the project will conform to the North American Architectural Woodwork Standards (NAAWS), custom grade. Medium Density Fiberboard (MDF) with no added formaldehyde (NAF) will be used as the primary substrate for HPDL finished elements or solid wood. In wet areas, such as countertops, moisture resistant MDF is to be used. Casework is to be constructed using a frameless, flush overlay style with concealed European-style hinges. Forest Stewardship Council (FSC) Certified wood and composite wood for casework shall be required.

**Wall Finishes:**

Speaking Hall areas and Exhibit Areas will have a higher level of finish, furniture, display, and technology components. Assume use of wood veneer paneling, acoustic wall paneling and a more aesthetic acoustic ceiling system at these areas as identified in the table above.

**Restrooms:**

All shared restroom facilities will have full height partitions with locking doors and exhaust air ducting for each space. Toilet compartments and handwashing areas to have ceramic floor tile and ceramic wall tile up to an 7-foot height. There will be one accessible drinking fountain with a bottle filler.

## D.3 CIVIL BASIS OF DESIGN NARRATIVE

### SITE ANALYSIS

The proposed building will be in the northeast portion of the site with a paved access way that connects 7th Street to the building and will serve as a loading area and as a location for required ADA stalls. The access roadway will have enough space for loading and for a garbage truck to drive, turn around, and leave the facility. Concrete sidewalks will connect the main entrance of the building to the existing campus walkway system, as well as walkways to the south. Since this building serves as a building for Eastern Washington University students, most students will walk to this facility and not drive. There is an existing 60-stall parking lot at the south corner of the site that will remain.

The site is generally flat and based on NRCS Web Soil Survey the soils do not appear to present any challenges for foundation design and stormwater management. Stormwater runoff from the building and pavement will be routed to swales with drywells. The stormwater drainage will be treated for water quality and infiltrated in bio-infiltration swales. The approximate size for these swales is 4,400 square feet. The roof drains will connect to the drywells or incorporate into landscape design features. Typical sizes for storm drain piping are 6" to 8" diameter PVC pipes.

During the construction activities for this project there should be minimal impact to surrounding neighborhoods and their daily uses. Most construction activities and equipment/material storage should remain on the site. There may be minimal traffic control when connecting the access road to 7th Street and if large equipment is mobilized. All existing trees and vegetation will be protected during construction. The site will be seeded and irrigated after construction is completed. All necessary erosion control methods will be utilized during construction.

### STORMWATER REQUIREMENTS

The proposed facility will follow the Stormwater Management Manual for Eastern Washington to meet the requirements for conveyance, flow control, and water quality treatment. It is anticipated that all stormwater will infiltrate on site but rainwater harvesting may be used to gain some LEED points. There will be a small amount of pollution generating impervious area, a small parking lot with an access road, that will be conveyed to a bio infiltration swale for water quality treatment. The bio infiltration swale will also be used for collecting the roof runoff from the building. Catch basins and piping will collect the runoff from the building and hard surface and be routed to the bio infiltration swales.

### UTILITY EXTENSION / RELOCATION ISSUES

The existing site currently has water and sewer stubbed to the site as there was an existing building in the northeast corner of the lot that has been removed. The old water and sewer lines that went to an existing building will need to be removed / abandoned. There are existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building. It is assumed the building will have fire sprinklers and will need a fire service line as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design. There also is an existing utility tunnel under the existing concrete sidewalk as well as abandoned cable lines near the site.

### EASEMENTS

There are no known easements located on the site.

## D.4 LANDSCAPE BASIS OF DESIGN NARRATIVE

### EXISTING SITE LANDSCAPE

The existing site is generally flat and has some minimal landscaping. There are irrigated turf and trees around the edges near pedestrian walkways and buildings. There is a large portion of the site covered in sparse turf areas with no irrigation.

### LANDSCAPE DESIGN GUIDANCE

The exterior landscape design will be guided by several resources. It will be guided by the principles outlined EWU Climate Resiliency Landscape Masterplan, the Climate Action Plan, and the Prairie Restoration Project. It will also include input from project stakeholders and any other applicable requirements.

### LEED CREDIT

The Lucy Covington Leadership Center Project is projected to receive a LEED Silver rating. Within LEED there are several areas where there is potential to gain points as they relate to the landscape design of this project.

- > Protect and Restore credits can be gained with 25 percent of the site being planted with native and adapted plant materials.
- > Open Space credit can be obtained by providing 30 percent or more of open space for the total site.
- > Rainwater Management credit can be gained by providing rain gardens with native and adapted plants, use of permeable paving, and providing permanent stormwater infiltration systems that collect 100 percent using features vegetated swales, rain gardens, or water cistern.
- > Heat Island Reduction credit can be gained by providing plant materials to shade paved areas and by providing paving materials that have an initial solar reflectance of at least 0.33.

- > Outdoor Water Reduction credit can also be gained by use of no irrigation or reduced irrigation by reducing outdoor water consumption by 50 percent from the calculated from the sites peak watering month as calculated by the Environmental Protection Agency (EPA) Water Sense Budgeting tool.

### OTHER RESOURCES

Other resources that will be utilized in the project will include the Washington Native Plant Society, native plant nurseries, and other resources with knowledge of native plants historically used by American Indians in the Eastern Washington areas. Information from local extension offices may also be utilized as a resource.

### LUCY COVINGTON LEADERSHIP CENTER LANDSCAPE DESIGN

With the existing site being flat with little landscaping, landscape design features will be added to define spaces, provide interest, and provide educational opportunities. Predominately native and adapted plants will be used.

Foundation plantings will be provided around the building, along with a location for a medicinal plant garden incorporating plants that have historically been used by American Indians.

Shade trees will be provided throughout the site. Berms and rock features will also be used to define spaces and provide interest to the project.

A water conserving irrigation system will be designed to irrigate plants and reduce exterior water usage. Landscape plantings and features will be integrated into the site's stormwater system to reduce stormwater runoff and piping.

Other features incorporated into the exterior landscape will include pedestrian walkways, benches for seating, a cook shed, sweat lodge location, outdoor gathering space, outdoor classroom/event space, and an outdoor seating/dining area. In addition, there is potential to restore small areas to their original historical prairie condition, as is being planned in EWU Prairie Restoration Project.

**TABLE:**  
**Concrete Requirements**

## D.5 STRUCTURAL BASIS OF DESIGN NARRATIVE

The following design narrative provides a general overview of the structural design including design loads, performance criteria, framing and lateral system descriptions, and material specifications.

### DESIGN CRITERIA

#### 2021 International Building Code

**Roof Dead Load** (includes solar panel load): 25 PSF

**Snow Load:** 32 PSF

- > Ground Snow: 40 PSF
- > Drifting and unbalanced snow loading in accordance with ASCE 7.
- > Importance Factor = 1.10 (based on Occupancy Category III rating)

**Roof Total Load Deflection Limit:** L/240

**Roof Live Load Deflection Limit:** L/360

#### Wind Design

- > Basic Wind Speed (3-second gust): 109 MPH
- > Exposure C
- > Risk Category III

#### Seismic Design

- > Site Class(Per code minimum) D
- > Spectral Response Coefficient (Short Period) SDS: 32.7%g
- > Spectral Response Coefficient (1-Second Period) SD1: 18.0%g
- > Seismic Design Category C
- > Importance Factor 1.25

### BUILDING FRAMING RECOMMENDATIONS

Preliminary plans are for a single story structure with a space for assembly with a high ceiling. Framing options for gravity loads include:

- > Conventional framing of wood studs with plywood sheathing for lateral design with press plate wood trusses for roof framing.

|                             | Minimum 28 Day Compressive Strength | Air Entrainment (+/- 1.5%) | Maximum Size Aggregate | Maximum Water/cement Ratio |
|-----------------------------|-------------------------------------|----------------------------|------------------------|----------------------------|
| All Structural Conc, U.N.O. | 3000 PSI                            | None                       | 3/4"                   | 0.50                       |
| Interior Slabs on Grade     | 3000 PSI                            | None                       | 3/4"                   | 0.42*                      |
| Exterior Slabs on Grade     | 4000 PSI                            | 6%                         | 3/4"                   | 0.45                       |
| Topping Slabs               | 3000 PSI                            | None                       | 3/8"                   | 0.42*                      |
| Footings                    | 3000 PSI                            | None                       | 1"                     | 0.50                       |
| Foundation Stem Walls       | 3000 PSI                            | 5%                         | 3/4"                   | 0.45                       |
| Exterior C.I.P. Walls       | 3000 PSI                            | 5%                         | 3/4"                   | 0.45                       |
| Structural Slabs & Columns  | 4000 PSI                            | None                       | 3/4"                   | 0.50                       |

\* Water/Cement ratio variance not allowed.

All reinforcing bars to be Grade 60 (Fy = 60,000 psi)

- > Mass-Timber framing with Cross-Laminated Timber members and glu-laminated beams.
- > The tall assembly space may require structural steel braced frames or moment frames depending on the openness of the space of the final design.

Foundations will consist of conventional, reinforced, continuous spread footings. Columns will be supported on reinforced, isolated concrete footings. Footing sizes will be designed to meet the allowable soil bearing pressure. The floor will be a 4 inch thick slab on grade, reinforced with #4 rebar at 24" on center, each way. Slab joint spacing will be approximately 12'-0" on center in each direction. Sub-grade preparation for the slab on grade will be completed per the geotechnical report.

The roof framing over the two wings of the structure and the assembly space will be proprietary wood members such as RedBuilt Joists or Glu-Lam beams with SIPS panels for the decking.

Wind and earthquake forces will be resisted by a likely combination of the following options:

- > Plywood-sheathed shear walls
- > Steel-braced frames/moment frames
- > CLT wall panels

### MATERIAL SPECIFICATIONS

**Concrete Requirements:** As shown in Table above.

#### Steel Framing Requirements

- > Connection material, embedded items: ASTM A36
- > Structural Tubes: ASTM A500, Grade B
- > Structural framing bolts (steel connections): ASTM A325N
- > Anchor Rods: ASTM A36
- > Threaded Rods: ASTM A36
- > Welding Electrodes: E70XX

#### Glu-Laminated Timber Beams

Per AITC 117 "Design Standard Specifications for Structural Glued Laminated Timber of Softwood Species"

Simple span beams: 24F-V4

Continuous or cantilever beams: 24F-V8

#### Cross-Laminated Timber Panels

CLT members to comply with ANSI/APA PRG 320 "Standard for Performance-Rated Cross-Laminated Timber"

#### Proprietary Wood Products

Premanufactured wood I-joists, open-web joists, beams, and trusses to have ICC acceptance. Possible manufacturers include but are not limited to:

- > RedBuilt
- > Trus Joist by Weyerhaeuser

## D.6 MECHANICAL BASIS OF DESIGN NARRATIVE

### GENERAL MECHANICAL REQUIREMENTS

All mechanical systems, equipment and components will be designed, selected and installed in accordance with all applicable codes and standards including:

- > International Building Code (IBC), Standards and Amendments.
- > International Mechanical Code (IMC), Standards and Amendments.
- > International Fire Code (IFC), Standards and Amendments.
- > Uniform Plumbing Code (UPC) Standards and Amendments.
- > International Fuel Gas Code (IFGC).
- > National Fire Protection Association (NFPA).
- > National Electrical Code, (NEC); NFPA 70.
- > 2021 Washington State Energy Code and all applicable State and local codes, laws and ordinances.
- > LEED Silver Criteria
- > Eastern Washington University Climate Action Plan 2022-2025
- > 2021-23Pre-design Manual for Capital Projects
- > Industry Standards
  - American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
  - Air Conditioning and Refrigeration Institute (ARI) Standards
  - NFPA 90A - Installation of Air Conditioning and Ventilating Systems

### ENERGY

#### Project Sustainability Goals

##### Electrification

- > As the electrical grid adopts greater percentages of renewable energy sources (wind, solar, hydro, etc.), a path to decarbonize the built environment is electrification. The 2021 Washington Energy Code will require electrification for buildings of this size & occupancy for HVAC systems and partial electrification of building domestic hot water. This will be accomplished for this project through heat pump technology via a centrally located ground source.

##### LEED Certification

- > Project is targeting LEED Silver certification minimum under the v4.1 New Construction pathway.

##### Resiliency

- > Project should consider the effects of climate change on projected weather patterns when sizing and planning for operation of HVAC systems.

##### High Performance Public Buildings per 39.35D RCW

- > Project to achieve LEED Silver minimum

##### Net Zero Energy per Executive Order 20-01

- > Building to be designed to zero energy or zero energy-capable
- > Team to evaluate building expected EUI and required PV array size along with for net zero ready, to be located on or off site as allowed by AHJ

##### Clean Buildings Act per RCW 19.27A.210

- > Compliance with operating EUI targets beginning in 2028

##### GHG Emissions Reduction Policy

- > Building to comply with statewide GHG emissions reporting requirements.
- > Follow EWU Climate Action Plan objectives.

#### 2021 WSEC Compliance

Project will be subject to the 2021 Washington building codes, including the 2021 Washington State Energy Code.

#### Envelope

- > Project is anticipated to comply prescriptively with envelope provisions via the R-value, U-value, or Component Performance alternative approach.

#### C406 Additional Energy Efficiency Credit Measures

- > Project shall comply with the minimum number of new building energy efficiency credits and new building load management credits per Table C406.1 and Table C406.2.
- > Suggested efficiency credit strategies to explore include but are not limited to:
  - Improved heating efficiency
  - High-performance DOAS
  - Reduced lighting power
  - Renewable energy
  - Heat pump domestic hot water heating
  - Reduced air infiltration
- > Suggested load management credit strategies to explore include but are not limited to:
  - Lighting load management
  - HVAC load management
  - Building thermal mass
  - Renewable Energy
- > Project shall either provide an on-site solar PV array sized per section C411 or shall comply with one of the available exceptions. Preliminary size calculated at approximately 15 kW installed capacity.
- > Project shall comply with solar readiness requirements to provide a solar zone for future PV and per section C411.

## MECHANICAL SYSTEMS

The following narrative describes the mechanical systems intended for the new Lucy Covington Building which is to be constructed in a two phase approach.

### Project Mechanical Goals

Utilize the EWU Physical Chilled Water Plant & New Geothermal Heating Plant proposed.

- > EWU has invested heavily in this chilled water plant over the years, and it has the available capacity to serve this new Lucy Covington building. In addition, there are pipe mains extremely close to the proposed building footprint. The project team will make use of this available source.
- > Utilize approximate 120 degree heating water for the new geothermal heating plant to reduce carbon footprint and reduce fossil fuel load of current campus steam system. New direct bury piping or tunnel construction will be required from central geothermal plant to proposed mechanical room location in phase 1.

### Healthy Buildings

- > Utilize decoupled ventilation & conditioning strategies using dedicated outside air systems (DOAS) or also known as energy recovery ventilators (ERV). These systems operate with the core intent to ensure buildings are well ventilated for students to learn success and improve energy efficiency. Provide both MERV 15 & carbon filtration to ensure high indoor air quality, even during forest fire seasons. Consider design impacts of future pandemic resiliency direction.

### Building Load Estimates

Cooling: ~70 tons (120 gpm) Total

~46.6 tons (80 gpm) for phase 1

~23.4 tons (40 gpm) for phase 2

Heating: ~975 MBH Total

~640 MBH (60 gpm) for phase 1

~335 MBH (30 gpm) for phase 2

Ventilation: ~9,600cfm

### Design Temperatures

- > Cooling air supply temperature: 55°F-60°F
- > Heating air supply temperature: 85°F-90°F
- > Chilled water supply/return: 44°F/56°F (from campus central chiller plant)
- > Heating water supply/return: 115-120°F/95-100°F (from new geothermal plant)

### Electrified Source Energy System Concept

#### Heating System

- > Hot water provided by the new campus low temperature heating water system that can supply 115-120°F water for heating use in building hot water coils.

#### Pumping configuration – primary/secondary

- > (2) primary inline pumps operating constant volume integral to equipment.
- > (2) secondary vertical inline pumps operating variable volume will serve building coils as required.
  - Pressure independent control valves to be used at all coils.
  - Control per local and remote DP sensors.
- > Located in the main mechanical room of phase 1.
- > Piping to be sized to accommodate phase 2 of project but capped at phase 1 for continuation.

#### Backup boiler plant hot water connection.

- > Sized to support the hot water supply via steam to hot water heat exchanger from EWU steam plant on campus via utility tunnels close to the Lucy Covington site & also build in system resiliency.

Other hydronic components include but are not limited to:

- > Coalescing air separator sized for nominal main pipe size.
- > Expansion tank.
- > Makeup water assembly.
- > Locate all hydronic equipment in the main mechanical room of phase 1.

#### Cooling System

- > Pumping configuration – Primary, Secondary, Tertiary
- > The primary and secondary pumps exist and are located at EWU's physical plant. Provide (2) tertiary vertical inline pumps operating variable volume to serve building coils. Tap off campus chilled water distribution utility tunnel northwest of building footprint and provide isolation valves exterior to the building in a small vault and immediately inside building.
- > Pressure independent control valves to be used at all coils
- > Control per local and remote DP sensors
- > For system options I, provide (2) dedicated inline pumps to serve the terminal coil with lower temperature water (dehumidification ability). The tertiary pumping assembly described above will tap off the return line to the building, mix to 55-57°F and serve all building sensible only coils in the chilled beam system.
- > Locate in main mechanical room in phase 1

#### Vibration & Sound Isolation

Mechanical equipment will be provided with vibration isolation mounts and hangers to meet criteria for maximum vibration levels.

HVAC systems will be designed to a maximum sound level of 45 dBA on the "A" weighted scale. More sensitive areas will be dealt with on a case-by-case basis depending on the space's specific requirements.

**IMAGE:**  
Dedicated Outside Air System (DOAS)

### Mechanical Insulation

Refrigerant piping will be insulated per manufacturers recommendations and IMC requirements.

Ductwork will be insulated with either external, flexible glass fiber blankets or internal, acoustical glass fiber duct liner.

### Exhaust Systems

Toilet rooms, and general room exhaust will be provided with either individual exhaust fans or can be integrated to the DOAS system exhaust so the energy can be recovered from the conditioned air that would otherwise be wasted.

### Air Distribution

Supply and return air will be distributed to each zone from the chilled beams(s) and fan coil(s) to the associated zone(s). Duct will be constructed per SMACNA standards and lining will be used to attenuate sound as needed to maintain acceptable sound levels for spaces served.

### Ductless Split System

A ductless mini split system, in its most basic form, includes one outdoor unit and one indoor unit, connected by refrigerant tubing and electrical wiring. The indoor unit is often wall-mounted and delivers heated or cooled air directly into the space – no ductwork needed. Ductless split systems will be utilized for rooms such as IT and electrical which require year-round dedicated cooling.

### Kitchen Exhaust and Make-up Air System

A type I hood system will be required for the commercial kitchen space. The indoor hood will be selected to meet the needs and equipment of the cooking space. A dedicated makeup air unit with evaporative cooling and natural gas heat will be located near the kitchen and ducted to the hood plenum. Demand controlled ventilation will be used to limit the amount of outside air needed from the makeup air unit and exhaust fan when systems under the hood are only in partial use.

### Dedicated Outside Air System (DOAS)

All systems mentioned in HVAC system options will be coupled with an energy recovery DOAS system to provide ventilation to each space throughout the facility. This system uses a centralized dedicated outside air fan system to filter and temper the outside air that is required to maintain an acceptable level of indoor air quality with a modern office building. The tempered air (55 F to 65 F) is distributed to multiple fan coil units that provide individual zone control to different parts of the building.

The DOAS draws air into the building through a set of MERV 13 minimum filters to remove the majority of particulate matter from the air. After the filters, the air is passed through an energy recovery heat reclaim coil that preheats the air with waste heat from the building exhaust system. Next the air is passed through heating and cooling coils which operate depending upon the ambient conditions. A supply fan is then used to distribute the tempered outside air through the building to the system chosen for building conditioning.

### Control Systems

This facility will utilize a Direct Digital Control system (DDC) for the control of the HVAC systems.

System features will include but not the following:

- > Optimum start/stop
- > Demand limiting
- > Monitoring of supply air, outside air and mixed air temperatures
- > Alarms
- > Trend logging

The control system will have a direct interface with the electric utility meter for energy monitoring purposes. All air handling units will be equipped with airflow measuring stations in the outside air ductwork to ensure adequate and efficient ventilation. All air handling units and fan coil units will be equipped with economizer capability.

### HVAC OPERATING STRATEGIES TO MAXIMIZE ENERGY SAVINGS

Varying air handler fan speeds:

- > Fan speeds may be adjusted not only in response to heating or cooling needs, but also to limit peak electrical demand. Most buildings exhibit thermal inertia, meaning that the mass of the structure and its contents tend to stabilize temperature changes even when heating and cooling systems work to alter them.

**IMAGE:**  
Chilled Beam System with DOAS

- > Some facility maintenance engineers have taken advantage of this stabilizing effect by reducing air handler fan speeds and the cooling or heating inherent in circulating air for brief periods (for example, 10 minutes out of an hour) when power cost is most costly. By sequentially shifting this reduction among all air handlers, no one space feels the reduction long enough to result in a significant change to occupant comfort.

Cooling and heating coil water supply temperatures:

- > An outdoor air sensor may be used with appropriate programming to raise heating water temperature as outdoor temperatures drop and lower it on moderate days.

Supply water temperatures also may be reset based on return water or return air temperature where they reflect the need for conditioning specific zones or on a time schedule to reflect occupancy. When no one is in space, its temperature may be allowed to vary widely.

Carbon dioxide sensors:

- > Carbon dioxide sensors can be used to control outside air intake. As with temperature control, sound HVAC design provides sufficient fresh air to deal with the worst-case scenario, including full occupancy in a zone such as meeting rooms or cafeterias. Most of the time, however, these spaces are only partially filled, so that far more outside air is brought in than required by code or comfort under this condition. Conditioning of outside air, at times, can account for nearly half the load on an HVAC system.
- > By measuring carbon dioxide in return air, a reasonable estimate of the number of occupants may be made, allowing for a reduction in outside air.

Chilled and heating water pump speed:

- > Pump speed can be reduced through the use of variable speed drives. When zone coil water control valves throttle back in response to a reduced load in the space, a pressure sensor located within the piping system can sense the change in pressure and reduce the flow through the system accordingly.

### HVAC SYSTEM OPTIONS

#### Chilled Beam System with DOAS (Preferred Alternative)

Active chilled beams use a circulating hot and chilled water loop that is routed to each heat pump unit. The heating and cooling source of this loop will come from either new the central geothermal campus plant and can be backed up via current campus central plant steam system.

Each chilled beam unit has a chilled and heated water connection to provide heating and cooling with the use of ventilation air from an energy recovery ventilator (DOAS). The temperature differential between the supplied and room air provides 3-4 times the amount of airflow increase through induction from what is provided to each chilled beam unit which greatly reduces overall system fan energy.

This mechanical system can vary widely in cost depending on geothermal plant capability. For pricing of this system, it is assumed to be heated water from the new geothermal heating plant with backup heat from campus steam system along with chilled water from the current chilled water plant and is estimated at approximately \$50/SF.

Advantages:

- > It's very flexible. The system can be subdivided or expanded into new zones to fit building remodeling or additions easily and inexpensively.
- > If a unit fails, the entire system doesn't shut down.
- > This type of system can easily be designed to facilitate partial occupancy of the building while the remaining portions are unoccupied.
- > No moving parts or filters on terminal units so maintenance is extremely low.
- > Its high efficiency reduces annual energy costs and reduces greenhouse gas/CO2 emissions due to no terminal fan use for distribution of air.
- > Newer technology allows for the variation of the nozzles airflow to accommodate demand control ventilation while not losing induction ratios.

**IMAGE:**  
**Four Pipe Fan Coil System with DOAS (Left)**  
**Variable Refrigerant Flow (VRF) with DOAS (Right)**

**Disadvantages:**

- > Temperature swings can be hard for the chilled beam to keep up with that can cause comfortability issues for some in the extreme hot or cold.
- > Pumps, Heat Pumps and/or chillers will require periodic maintenance.

**Four Pipe Fan Coil System with DOAS**

Four-pipe systems utilize two independent coils, one for heating and one for cooling, modulating cooling and heating valves for controlling coil capacities allow this type of system to only deliver the quantity of heating or cooling required by the space load. This makes the system very comfortable. For example, if 62F air is required to condition the space, then the coil valves will modulate water flow to the coils to deliver air at this temperature.

This system requires a central chiller and a boiler to provide the heating and cooling water to each respective loop. The water is circulated to the fan coils located in various mechanical rooms within the facility or could come from the campus network.

The estimated first cost for this system is around \$45/SF installed.

**Advantages:**

- > Unoccupied areas of the building may be isolated and shut down.
- > Zones can be individually controlled.
- > Familiar system across campus.

**Disadvantages:**

- > This system requires multiple building envelope penetrations to accommodate individual outside air and relief hoods/louvers.
- > Water loops need to be chemically treated periodically to prevent corrosion.
- > Failure of the many valves and components it is circulated through.

**Variable Refrigerant Flow (VRF) with DOAS**

Variable refrigerant flow systems with heat recovery (VRF-HR) capability can operate simultaneously in heating and/or cooling mode, enabling heat to be used rather than rejected as it would be in traditional heat pump systems. VRF-HR systems are equipped with enhanced features like inverter drives, pulse modulating electronic expansion valves and distributed controls that allow the system to operate in net heating or net cooling mode, as demanded by the space.

The system we would propose would use a combination of concealed ducted ceiling mounted units to condition smaller

individual spaces. Fan coil style units would also be used in larger meeting and conference rooms to provide adequate zoning. Additional refrigeration piping and capacity will be added based on anticipated needs by the owner. The outdoor condensing units will be mounted on the ground near the building since we will likely have a pitched roof. If mounting the unit on the roof is unacceptable, a well space at roof level or a ventilated mechanical space at the perimeter of the building are also acceptable locations for the units. Efforts will be made to locate the units in a central location considering the refrigeration line length limitation of the systems.

The estimated first cost for this system is around \$42/SF installed.

**Advantages:**

- > It's very flexible. The system can be subdivided or expanded into new zones to fit building remodeling or additions easily and inexpensively when extra branches are provided and capped.
- > If a unit fails, the entire system doesn't shut down.
- > This type of system can easily be designed to facilitate partial occupancy of the building while the remaining portions are unoccupied.
- > Its high efficiency reduces annual energy costs and reduces greenhouse gas/CO2 emissions.

**TABLE:**  
**Analysis of Mechanical Systems**

Disadvantages:

- > Refrigerant leaks can be troublesome to track down when they occur.
- > The sound of outdoor condensing units can be loud.
- > Control integrations between proprietary controls and DDC can be problematic for precise control.

## D.7 PLUMBING BASIS OF DESIGN NARRATIVE

Domestic hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F from a water to water heat exchanger located in the mechanical room of phase 1. If water temperatures in excess of 120°F are needed within the building, an electric booster heater should be provided (style of booster heater to be determined based upon discussions with EWU). Point of use mixing valves will be used at all lavatories and hand washing sinks to limit water to 105°F. Each system will have a circulation pump, which will operate only in the building occupied hours, or as programmed by the Energy Management System.

Plumbing fixtures, water heaters, domestic water piping, sanitary waste and vent piping, and storm drainage (rainwater) piping will be designed and installed in accordance with the Uniform Plumbing Code, Washington State Amendments to UBC Chapter 11 Accessibility and the Rules and Regulations of the Washington State Board of Health.

Site Utilities for sewer and water service will come from existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building. It is assumed the building will have fire sprinklers and will need a fire service line

| SYSTEM                                | COST ESTIMATE:  | PRO   | CONS   |
|---------------------------------------|---|---|--|
|                                       | <ul style="list-style-type: none"> <li>- FIRST COST</li> <li>- ANNUAL MAINTENANCE COST</li> <li>- ANNUAL ENERGY COST</li> </ul> |   |  |
| Chilled Beams (Preferred Alternative) | \$1,200,000<br><br>\$4,464<br><br>\$41,240  | <ul style="list-style-type: none"> <li>• Lowest energy system</li> <li>• Possible Integration of Campus Utilities</li> <li>• Very Little Maintenance for Terminal Units</li> <li>• Individual Room Control</li> </ul> | <ul style="list-style-type: none"> <li>• High First Cost</li> <li>• Relies on Geothermal Central Plant for Maximizing Efficiency</li> </ul>  |
| 4-Pipe Fan Coil                       | \$1,080,000<br><br>\$6,460<br><br>\$54,200  | <ul style="list-style-type: none"> <li>• Possible Integration of Campus Utilities</li> <li>• Ease of Controllability</li> <li>• Familiar System on EWU Campus</li> </ul>  | <ul style="list-style-type: none"> <li>• No Individual Room Control for Smaller Spaces</li> <li>• Not as Efficient as Other Systems</li> <li>• Chiller/Boiler Maintenance</li> </ul>   |
| Variable Refrigerant Flow             | \$1,008,000<br><br>\$3,752<br><br>\$40,385  | <ul style="list-style-type: none"> <li>• Lowest First Cost</li> <li>• Energy Efficient</li> <li>• Flexible Installation</li> <li>• Individual Room Control</li> </ul>   | <ul style="list-style-type: none"> <li>• No use of Campus Utilities</li> <li>• Lots of refrigerant piping and leak potential</li> <li>• Shorter Equipment Lifespan</li> <li>• Specialized Technician Required for Maintenance</li> </ul> |

as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design.

It is estimated that the new facility will require a 2-1/2 inch domestic water service and a 6-inch wastewater connection. Survey information will determine if a new tap is required for either service mentioned.

Kitchen faucets will be limited to 2.2 gallons per minute (gpm) flow except for those used for filling operation. Toilet rooms will have wall hung water closets (1.28 gallons per flush) and urinals (0.125 gallon per flush) with battery-powered, sensor-operated flush valves. Lavatories will be low flow (.5 gpm), battery-powered, sensor-operated faucets.

LEED requirements may affect the values stated above if points for Indoor Water Use Reduction are implemented.

## CONCLUSION

In conclusion, we believe the active chilled beam system will be the best system fit for the proposed building and use. Blending high efficiency and versatility while respectfully using the land as a heat sync provides one of the lowest carbon footprints available and will assist in LEED certification of the new facility. While this system is not the least expensive upfront cost option it will attain project goals of sustainability and renewability which are extremely important to the meaning and mission of the Lucy Covington Building stakeholders. This system also gives excellent zone control and equipment longevity which is easily modified for future building reconfiguration in the future. The table below is a summary of estimated costing and benefit analysis.

## D.8 ELECTRICAL, TELE-COMMUNICATIONS, AND SECURITY BASIS OF DESIGN NARRATIVE

### PROJECT ELECTRICAL ANALYSIS

#### General

The conceptual program for the Preferred Alternative allocates approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering & event spaces, student collaboration & support spaces, and exhibit gallery & performance spaces. The proposed building concept incorporates a speaking hall that accommodates 300 people, a student commons for studying and collaboration, and exhibit space featuring the life and legacy of Lucy Covington.

Located on the southeast corner of 7th Street. And G Street, in the City of Spokane, Washington. The project includes minimal additional parking in accordance with City of Spokane ordinances and provisions, given there is existing parking in proximity. The new building will adhere to the 2021-23 OFM Biennium Predesign Manual & the 2020 NEC (National Electrical Code). Design will provide power and infrastructure for solar readiness to allotted space designated by architect to comply with 2021 Washington State Energy Code.

#### Applicable Codes And Standards

The completed installation will conform to the latest adopted version of all federal, state, and local codes with amendments and additions, regulations, including industry standards, such as:

- > IEEE: Institute of Electrical and Electronic Engineers
- > NEMA: National Electrical Manufacturers Association
- > NFPA: 110

- > NFPA: National Fire Protection Association
- > NEC: National Electrical Code
- > IBC: International Building Code
- > IFC: International Fire Code
- > TIA/ETA: All Applicable Telecommunications Industry Assoc./ Electrical Industries Alliance. Applicable State and local codes, laws, and ordinances.

All Necessary permits and inspection required by the governing authorities having jurisdiction over this work are to be obtained by the Contractor. Compliance with state and local codes is the responsibility of the Contractor.

#### Existing Site Utilities

Existing onsite power. The proposed project site is currently serviced by Avista through underground electrical distribution system. The campus Electrical Distribution Upgrades Ph. 2, Termination Pt. #11A above grade, brings a high voltage switch to the proposed Lucy Covington Leadership House site. A new underground feeder from the existing termination Pt. #11A will be installed to serve the new building. Transformer location to be coordinated during design phase

Utility to coordinate burial of remaining electrical overhead services and/or relocation of underground electrical. Avista and Eastern Washington Campus Officials to verify acceptable design.

#### New Electrical Power Distribution

The proposed project site is currently serviced by underground electrical and would require use of the above ground service and meter locations to be coordinated with Architect. Estimated utility service will be 2000 AMPS at 208V, 3 PHASE, with estimated loads as follows:

- > Lighting 18.7 Kw
- > Air Conditioning 100 Kw
- > Heating 28.3 Kw
- > Water Heating 15.4 Kw

- > Cooking 13.7 Kw
  - > Refrigeration 3.66 Kw
  - > Receptacles 137.3 Kw
  - > Miscellaneous 4.6 Kw
  - > Elevators 20 Kw
  - > Other Motors 92.7 Kw
- Total Connected Load 434.4 Kw  
+25% Spare Capacity 543 Kw

543 kW at 80% Power Factor 679kVA  
(1885 amps)

#### Power Density

Standard power density (W/ft<sup>2</sup>) for typical educational space will be provided.

#### Redundancy And Emergency Power

A generator will be provided for the addition as an alternate electrical source of power for use during an interruption of the normal electric supply if the existing emergency generator systems prove to be loaded to the recommended maximum capacity. Generator back-up and emergency power will be provided in accordance with the NEC, and NEMA 110.

Eastern Washington University Campus requirement specify emergency and standby power generation will be provided by means of a weatherproof sound attenuating engine driven natural gas fueled generator set. The generator will be sized to supply the emergency and standby loads served. Emergency power will be monitored to report most normal failures such as low starting batteries, overload, etc.

The generator(s) will be mounted at appropriate height to allow for maintenance access to oil drain low point. Provided with an automatic transfer switch to automatically switch loads between the normal EWU campus power and generator backed power.

The emergency electrical distribution system will supply power to all life safety systems within the building such as egress lighting, exit lighting and the fire alarm system. Standby power system

is to provide generator backed power to non-life safety loads within the new building as necessary, such as computer servers, telecommunications rooms and its associated cooling along with any other equipment determined critical.

### Lighting Design

Lighting controls will be in accordance with applicable energy codes. Lighting levels will be provided in designated spaces per 2021 Washington State Energy Code. We will use the Illuminating Engineering Society (IES) standards for all areas not covered by the Architect/Engineer Design Guide. High efficiency LED luminaires will be provided with energy-saving control and switching scenarios. Light fixture types, layout and switching configurations/locations, utilizing antimicrobial finishes where required will be closely coordinated in accordance with EWU standards and design intent. In addition, site/parking LED lighting standards will also be added and integrated into the existing campus site-controlled lighting infrastructure. Lighting CCT will range from 3500 K - 4000 K promoting focus and alertness in an education facility. Interior Lighting Power Allowances – Building Area Method will meet the 0.70 LPD (w/ ft<sup>2</sup>) per WAC 51-11C-405053. Exterior building grounds lighting will have an efficacy of 100 lumens per watt per WAC 51-11C-4705061.

### Lighting Levels

Lucy Covington Leadership house required lighting levels are as follows: (For spaces not listed, the current IESNA light level recommendations will be followed).

- > Offices: 45 FC with dual level switching and occupancy sensor.
- > Lobbies: 20 FC
- > Corridors and means of egress: 15 FC.
- > Conference rooms: 30 FC to 50 FC with dimming controls as required.
- > Restrooms: 20 FC
- > Equipment rooms: 30 FC

- > Computer Rooms/Data Center: 50FC with dual level switching.
- > Laboratories (general): 750 to 100FC.
- > Exterior lighting at building entrances, walkways, streets, and parking lots: Not more than 2 FC.

Enhanced Circadian Lighting Design that promotes higher productivity, improved memory and cognitive function including improved mood and metabolic health will be considered to combat the systemic relationship that Indigenous students have with education facilities.

### Lighting Controls

Manual switches to turn on, occupancy sensors to turn on or off, scheduled lighting controls and lighting sweeps and daylight dimming will be designed in accordance with applicable state and federal energy codes in addition to meet and/or exceed project LEED Silver certification requirement. Predesign lighting control intent is as follows:

- > Open office: manual switch on, occupancy sensor off.
- > Closed office, storage and copy rooms: manual switch on, occupancy sensor off.
- > Corridors and other service spaces: time clock schedule.
- > Perimeter office (open and closed), lobbies and corridors: same as above, but also include daylight dimming.
- > Conference rooms: manual switch on, occupancy sensor off.
- > Parking garage: Not Applicable.
- > Exterior: photocell and time clock.

### Receptacles

Receptacles will be duplex-grounded receptacles and no more than 6 duplex receptacles on a single circuit. Electrical receptacle cover plates will be distinctively colored or marked for identification.

Electrical receptacle cover plates or electrical supplied from the emergency system will be distinctively colored or marked for identification. Ground fault

interrupters will comply with NFPA 70. Receptacles will comply with the Architect/Engineer Design Guide.

### Conduit

Conduits will be rigid metal type when used in damp or exposed locations, or when specifically required by the NEC. PVC conduit will be used where routed underground. PVC Schedule 40 conduit will be used for concrete encased circuits. PVC Schedule 80 conduits will be used for direct buried branch circuits. Electrical metallic tubing will be used in dry concealed locations and in furred, ceiling spaces. Flexible conduits will be used for final connections to be recessed luminaires, motor driven equipment and vibrating equipment. Conduit will not be used as a ground path; all electrical circuits will contain an equipment ground wire. Minimum conduit size will be ¾" trade size for homeruns, ½" to receptacles, switches, and luminaires.

### Conductors

Conductors will be copper with 600-volt insulation. Conductors No. 8 and larger will be stranded, type THWN. Smaller conductors will be a solid type THHN/THWN. Aluminum conductors will not be permitted. Conductors for use in high temperature locations will be insulated as required by the NEC. The minimum size of power conductors will be No. 12 AWG.

### Fire Alarm System

The Fire Alarm System will be provided in compliance with NFPA 101 and NFPA 72 as well as the Architect/Engineer Design Guide. The system will be integrated into the existing campus facilities fire alarm system. Contractor will provide a complete fire alarm system design to meet all requirements of the AHJ (Authority Having Jurisdiction).

No specific type or manufacturer is required during predesign, EWU campus preferred manufacturer and type will be coordinated during design phase. A fully addressable system is required to be code compliant.

### Security System

Coordination with Owner's preferred vendor for rough-in and raceway only to device locations to be fully integrated per EWU standards.

### Data And Communication Systems

The data and communications system scope of work at this time includes horizontal cabling for condominium units (phone and CATV), backbone cabling to each office level and each of two major retail tenant spaces, and house cabling needs. This includes copper, cable TV and fiber optic for backbone, and copper UTP and CATV for horizontal cabling. Lucy Covington Leadership House data and cabling will be designed with Phase 2 taken into consideration.

Networking equipment such as servers, ethernet switches, routers, software, and computers will be owner provided.

Telecommunication Rooms: MDF room will be a dedicated space located on the first floor of the building, to be designed for the termination of horizontal station cabling, backbone cabling and campus distribution cabling.

### Security And Access Control

Coordination with Owner's preferred vendor for rough-in and raceway only to device locations. Security concerns for the building include controlling access to the office during the day to meet campus expectations and after hours. No specific type or manufacturer is being specified during predesign. Desired security system features (e.g., card reader, fingerprint, length of image storage capacity, remote access capabilities and backup features, user programmability, reporting functions, battery backup duration, etc.) will be coordinated with EWU campus security.

### Audio Visual Systems

To be room specific, coordination with Owner's preferred vendor for rough-in and raceway only to device locations. Distribution of audio and video signaling within each classroom and conference room in accordance with EWU standards.

The system will consist of AV input plate(s), ceiling mounted speakers, amplifier/video switcher, control panel, mounting hardware, wireless microphones, assistive listening output, and cabling. Audio visual equipment, such as video projectors, flat panel displays, etc. and will be furnished by the owner.

## SUSTAINABILITY

### General

Project baseline goal is LEED Silver with mandated Energy and Atmosphere requirements as follows:

- > Fundamental Commissioning and Verification
- > Minimum Energy Performance
- > Building-Level Energy Metering
- > Fundamental Refrigerant Management

Stretch goal for project entailing LEED Platinum to be addressed during design phase. EWU has expressed strong interest in Net Zero Renewable Energy. Enhanced goals to achieve Net Zero to be further assessed during design phase taking into account cost effectiveness, space constraints and environmental impact. Cost effective is defined as a simple payback of less than 5 years or a life cycle cost less than the baseline. A life cycle cost analysis (first cost, energy, operations, maintenance, replacement, productivity), is not necessary for measures with simple paybacks less than 5 years.

### Solar Design

On-site renewable energy. New buildings larger than 10,000 square feet of gross conditioned floor area, will include a renewable energy generation system consisting of not less than 0.5 W/ft<sup>2</sup> or 1.7 Btu/ft<sup>2</sup> multiplied by the sum of the gross conditioned floor area. Washington State Energy Code 2021 Edition, 51-11C WAC Section C411.

Based on a 15,000 SF footprint the solar design will need to generate 7-8kW of renewable energy. It can be anticipated

to be a minimum of \$93,000.00 Solar Energy Electrical Power Generation System including, solar panels, inverter(s), mounting, accessories.

### System Specifications:

- > MAXIMUM POWER DC (WP): 8,000 watts DC; 8.0 kW
- > MAXIMUM POWER AC (WP): 7,305 watts AC CEC
- > ESTIMATED POWER GENERATED: 967 kWh AC monthly average
- > MAXIMUM POWER VOLTAGE VMP (V): 240 Volts

- > ARRAY WEIGHT: 1,120 lbs.
- > DISTRIBUTED LOAD: 2.6 lbs. psf.

### Sustainability Goals And Strategies Summary

Eastern Washington University commitment to sustainability (EWU Climate Action Plan) and decarbonization offers several opportunities for LCLH to integrate enhanced energy efficiency design directives to include but not limited enhanced lighting control, color rendering, established equipment benchmark (e.g., plug load v. total energy consumption), controlled receptacles, light pollution reduction and renewable onsite energy.

Challenges towards building wide sustainability include space constraints limiting onsite renewable photovoltaic energy production. Photovoltaic battery storage and efficacy losses also pose a concern for a net zero design. Photovoltaic battery storage needs, an approximate lifespan of 20 years and cost effectiveness concerns pose ongoing challenges and future concerns. Electrical Utility power grid requirements will not reduce total Avista power plant capacity design and needs for the building.

## COMMISSIONING

### Scope

Current commissioning scope with campus management includes lighting controls, fire alarm interface, emergency power.

Electrical equipment (switchboards, panel boards, transformers), vertical transport, special systems (security, data and communications, intercom, CCTV, fire, life safety, fire alarm) are not under commissioning authority but will still have quality control and assurance requirements performed by design team, campus operations staff and the contractor.

### Commissioning Plan

An Ongoing Commissioning Plan is a required document for LEED, Fundamental Commissioning of the Building Energy and Atmosphere Systems.

### Rigor

Project predesign commissioning scope is for above average rigor of building systems.

### Design Reviews

Design Reviews are characterized by a thorough independent design review of the commissioned systems and assemblies by qualified engineers focusing on commissioning, performance, and O&M issues.

### Specifications

Commissioning specifications will be thorough and fully describe all requirements of the Contractor, including specific testing requirements for each type of equipment.

### Roles

The roles of all parties and the sequence of the commissioning process will be clearly and completely described.

### Installation Verification

Installation Verification during early and mid-construction the level of rigor is characterized by field observation by the Commissioning Authority or team, as necessary, to observe component and system installations for general progress and issues affecting performance and testing. Contractors are responsible for the installation, set up and startup of their equipment and filling out Commissioning Authority provided, and all manufacturer provided checklists.

### Performance Verification

Performance Verification/Testing will be accomplished through review of control code programming, documented field testing of each sequence of operation for all equipment and through monitoring performance over time with trend logs from the building automation system. Testing will be conducted from detailed, step-by-step, repeatable test scripts specifically applicable to this project approved by the Commissioning Authority. Testing will include testing each sequence in the sequence of operations, and other significant modes, sequences and control strategies not mentioned in the written sequences; including, but not limited to startup, shutdown, unoccupied and manual modes, modulation up and down the unit's range of capacity, power failure, alarms, component staging and backup upon failure, interlocks with other equipment, and sensor and actuator calibrations.

All larger, more complex, or life-safety equipment will be individually tested. Testing only a sample of some equipment may be allowed where such equipment is small in physical size or importance, is numerous and is not complex or critical for life-safety. Tests for a given system or assembly will not be conducted until they are fully operational under normal and reliable control with construction checklists, control calibrations, programming and control system graphics complete.

All testing documentation for complex equipment will be directed and overseen by the Commissioning Authority or by another independent party, such as the fire marshal or a certified independent testing company (e.g., electrical equipment testing). Documented testing for less complex equipment and repetitive equipment (of large quantities, e.g., air terminal units) may be directed by the Contractor alone, as approved by the Commissioning Authority, with spot retests and test report review by the Commissioning Authority.

### Commissioning Objectivity

Project predesign commissioning scope is for typical level of objectivity. Commissioning Authority will have direct access to independently discuss issues with any party of the project team and by all issues identified by the commissioning team from initial identification being concurrently distributed directly to the Owner, Architect and Contractor.

### Issue Management

Issue Management. Issues are legitimate for identification and distribution when, 1) Any requirements as delineated in the contract documents are not being met, or 2) When significant elements of the EWU's Project Requirements are not being met). Issues will be reported regardless of potential cost impacts to any party or potential impacts to the project schedule.

## SECTION 06

## APPENDIX E: MEMORANDA OF UNDERSTANDING

## E. MEMORANDA OF UNDERSTANDING

The Lucy Covington Leadership House will further the goals of Eastern Washington University's commitment to the Memoranda of Understanding (MOUs) with three regional Tribes: Coeur d'Alene (July 26, 2019), Kalispel (February 12, 2018), and Spokane (April 15, 2019).

The primary purpose of the MOUs is to sustain and advance relationships between EWU and these Tribes. The purpose identified in the MOUs are summarized as follows:

- > Establish an Annual Tribal Leadership Summit.
- > Establish an American Indian Advisory Board where each Tribe has the authority to appoint one individual.
- > Recruit, retain, and successfully graduate more American Indian students.
- > Recruit, retain, and promote qualified American Indian faculty and staff to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
- > Strengthen partnerships between tribal communities and EWU academic and student support areas.
- > Plan and construct a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's Tribes, and serves as a place for cultural learning and exchange for the entire community.

Through the MOUs, the preceding priorities will receive sustained attention from EWU and the Tribes to maintain communication and address shared objectives.

The MOUs are guided in spirit by the Centennial Accord between the Federally Recognized Indian Tribes in Washington State and the State of Washington of 1989. The accord affirms the sovereignty of Washington's federally recognized tribes and calls for clearer communication and better collaboration between tribal and state governments.

#### **Lucy Covington Center Repository Research Agreement**

Through an ongoing partnership with the Colville Confederated Tribes that Eastern Washington University formalized in the 'Lucy Covington Center Repository Research Agreement,' EWU intends to honor Lucy Covington's legacy. Within the Lucy Covington Initiative, emphasis areas have been identified: supporting future leaders; creating a confluence of culture and causes; and developing a Lucy Covington Archive.

The MOUs are included in this Appendix. A full copy of the Lucy Covington Center Repository Agreement (14 pages) is also available upon request.

**Re: Memorandum of Understanding Between the Spokane Tribe of Indians and Eastern Washington University**

Dear Ms. Jones,

Enclosed please find two original copies of the Memorandum of Understanding Between the Spokane Tribe of Indians and Eastern Washington University (“MOU”) and the Spokane Tribe of Indians regarding, among other things, establishing an Annual Tribal Leadership Summit and a Native American Advisory Board.

The Spokane Tribal Business Council (“Tribal Council”) has approved the MOU and Chairwoman Carol Evans has signed on behalf of the Tribe. Please countersign both original copies, keep one original for your records, and return the other to the Tribe via the enclosed self-addressed return envelope. The Tribe looks forward to working with EWU to strengthen the relationship and enhance EWU’s educational research and service partnerships and programs.

Respectfully,

A handwritten signature in black ink, appearing to read "Jessica Flett". The signature is written in a cursive, flowing style with a long horizontal stroke extending to the right.

Jessica Flett  
Legal Counsel

## Memorandum of Understanding Between The Spokane Tribe of Indians and Eastern Washington University

This Memorandum of Understanding (“MOU”) is entered into by Eastern Washington University (“EWU”) and the Spokane Tribe and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.’

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Spokane Tribe of Indians and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Spokane Tribe.

EWU and the Spokane Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU’s educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

### 1. Purpose.

- 1.1 Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Spokane Tribe:
  - 1.1.1 Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.
  - 1.1.2 Establishing a Native American Advisory Board (“Advisory Board”) composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.
  - 1.1.3 The Tribal Business Council of the Spokane Tribe of Indians shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.
  - 1.1.4 Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.
  - 1.1.5 Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
  - 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.

- 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
  - 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Spokane Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided by the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).
- 3. Implementation of MOU**
- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.
  - 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
  - 3.3 This MOU may be amended by mutual written agreement of the parties at any time.

3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

**MEMORANDUM OF UNDERSTANDING**  
**BETWEEN**  
**THE COEUR D'ALENE TRIBE AND EASTERN WASHINGTON**  
**UNIVERSITY**

This Memorandum of Understanding ("MOU") is made between Coeur d'Alene Tribe ("the Tribe"), P.O. Box 408, Plummer, Idaho 83851, and the Eastern Washington University ("EWU"), 214 Showalter Hall, Cheney WA 99004, and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Tribe and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Tribe.

EWU and the Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU's educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

**1. Purpose.**

**1.1** Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Coeur d'Alene Tribe:

**1.1.1** Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.

**1.1.2** Establishing a Native American Advisory Board ("Advisory Board") composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.

**1.1.3** The Tribal Council of the Coeur d'Alene Tribe shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.

**1.1.4** Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.

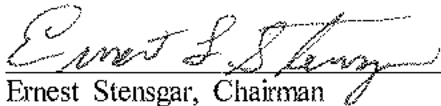

- 1.1.5 Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
  - 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.
  - 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
- 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Coeur d'Alene Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws. Nothing in this MOU shall be construed as a waiver of the Tribe's inherent sovereign immunity.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided in the spirit of the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in

Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).

**3. Implementation of MOU**

- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.
- 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
- 3.3 This MOU may be amended by mutual written agreement of the parties at any time.
- 3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

## Memorandum of Understanding Between The Kalispel Tribe of Indians and Eastern Washington University

This Memorandum of Understanding (“MOU”) is entered into by Eastern Washington University (“EWU”) and the Kalispel Tribe and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.<sup>7</sup>

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Kalispel Tribe of Indians and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Kalispel Tribe.

EWU and the Kalispel Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU’s educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

### **1. Purpose.**

- 1.1** Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Kalispel Tribe:
  - 1.1.1** Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.
  - 1.1.2** Establishing a Native American Advisory Board (“Advisory Board”) composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.
  - 1.1.3** The Tribal Business Council of the Kalispel Tribe of Indians shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.
  - 1.1.4** Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.
  - 1.1.5** Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.

2/1/18

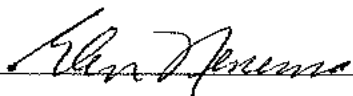

- 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.
  - 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
  - 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Kalispel Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided in the spirit of the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).
- 3. Implementation of MOU**
- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.

2/1/18

- 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
- 3.3 This MOU may be amended by mutual written agreement of the parties at any time.
- 3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

| 1.2  | <p>EWU Climate Action Plan &amp; Certification Paths:<br/>The team broadly reviewed EWU's 2022-2025 Climate Action Plan, following by discussion of different sustainability certification paths.</p> <p>LEED Certification</p> <ul style="list-style-type: none"> <li>&gt; Project will be required to meet LEED Silver level certification. Other campus projects were able to achieve Gold level certification, and that can be a target for Lucy Covington Leadership House project.</li> </ul> <p>International Living Future Certifications</p> <p>The team broadly reviewed different levels of ILFI Certification systems</p> <ul style="list-style-type: none"> <li>&gt; EWU noted CORE Green Building Certification may be worthwhile to consider if requirements appear to be in strong alignment with the project</li> <li>&gt; Further review is needed to better understand how this certification compares with LEED Gold level; to understand the level of effort and differences in certifications.</li> <li>&gt; Exploring a certification program alternative to LEED may be of interest to keep up with or surpass other rival universities that are pursuing alternative sustainability certifications.</li> </ul> |           |
| 1.3  | <p>Sustainability Considerations</p> <p>SITE</p> <p>The team discussed ways to reconnect and relate to the natural environment and the surrounding context through baseline and stretch goal lenses.</p> <ul style="list-style-type: none"> <li>&gt; Baseline: open space, bioretention swales and rain gardens, reduction of het island effect on the project site</li> <li>&gt; Creation of ethnobotanical garden- pilot credit. Medicinal garden has been identified as a desired component of the project.</li> <li>&gt; Stretch goals: permeable paving may be a consideration, but a green roof is not desired as it is not as successful considering the climate.</li> </ul> <p>WATER</p> <p>The team discussed ways to rethink how we use water, respect it as a natural resource, and work in harmony with natural water flows.</p> <ul style="list-style-type: none"> <li>&gt; Baseline use of low flow fixtures and ultra-low flow fixtures acceptable. Waterless urinals have been problematic in the past and should be avoided.</li> <li>&gt; Baseline heat pump water heating systems can be implemented along with hot water assist form water source heat pump units</li> </ul>  |           |

mahlum

combined with hot water recirculation to provide building domestic hot water. This will be explored and

- > Stretch goal: Rainwater harvesting, and grey water reuse requires complex systems and space that would be better used in upgraded efficiencies and energy use systems. These will not be pursued unless needed.
- > Stretch goal: Advanced water metering of systems to identify possible water saving strategies and solutions to implement was an option to explore.

## ENERGY

The team discussed ways to reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

- > Baseline will use high performance HVAC equipment in conjunction with Micro District Ground Source System in combination with decoupled high efficiency DOAS system which will achieve EUI of low 20's.
- > Passive cooling via operable windows is seen as problematic due to security and outdoor air conditions that present themselves in the area throughout the year. This would also be problematic with louvered openings and wind sails as well.
- > Passive style envelope to help energy usage systems perform at the highest level possible is encouraged.
- > Interface between water source heat pumps and domestic water systems to help drop energy usage across systems will help overall system efficiency.
- > Stretch goal: Enhanced commissioning can be used to ensure systems are being properly utilized to maximize efficiency. This was a possibility to investigate the project.
- > Possible credits for renewable energy power agreements that may already be used on campus. Research will be done to see if this is viable.
- > PV panels are desirable, but the team discussed the challenge of power storing to get the project towards net zero, due to both first cost and efficiency loss.

## CARBON

Team discussed ways to reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

- > Project would pursue CLT and sustainably sourced lumber to reduce project's embodied carbon impacts.
- > Low carbon concrete mix will be another way to reduce overall carbon footprint of the building.

mahlum

- > Team concluded that purchasing carbon offsets is not of interest due to lack of transparency and measurable outcomes.

#### HEALTH

The team discussed impacts and the relationship of the quality of materials, air and environment on human health.

- > Some baseline identified goals are design to Universal Design Principles, incorporating biophilia and access to daylight, but also specifying materials with Declare label.
- > Advanced filtration was also brought up using higher efficient filters on DOAS systems as well as the possibility of contaminant mitigation strategies such as ionization, electrostatic filters, UV light or HEPA filtration. This would be on a case-by-case basis and will be coordinated through design and implemented if desired.
- > Health can also be increased ventilation to spaces throughout the building while attaining credits. This was not commented on but will be investigated if desired.
- > Decreased acoustical reverberation can lead to a better overall environment and will be accounted for in design using duct lining, duct silencers, equipment selection and material systems chosen. This reduces the building "shock" factor when entering space.
- > Thermal comfort will be guaranteed through proper zoning and control of HVAC system such that each occupant will have optimized productivity and wellbeing. This was encouraged.

The meeting graphics presented are included in the attached document:

**END OF MEETING MINUTES**

# Lucy Covington Leadership House Project Update March 20, 2024

## Meeting Agenda

- Introductions (1 min)
- EWU Climate Action Plan & Certification Paths (9 min)
- Sustainability Goals & Strategies (60 min)
- Next Steps (5 min)

## Lucy Covington Leadership House EWU Climate Action Plan

### GREENHOUSE GAS REDUCTION STRATEGIES

BUILDING  
EFFICIENCY

TRANSITIONING  
CENTRAL PLANT  
TO RENEWABLE  
SOURCES

LAND  
RESTORATION

TRANSPORTATION  
"GREENIFICATION"

## Lucy Covington Leadership House Sustainability can look different

**SITE**

Reconnect and relate to the natural environment and the surrounding context.

**WATER**

Rethink how we use water, respect it as a natural resource, and work in harmony with natural water flows.

**ENERGY**

Reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

**HEALTH**

Human health and potential is strongly impacted by the relationship to and quality of materials, air and environment.

**CARBON**

Carbon emissions into the atmosphere are a primary driver of global warming and climate change.

# LEED NC

**Integrative Process**

**Location & Transportation**

**Sustainable Sites**

**Water Efficiency**

**Energy & Atmosphere**

**Materials & Resources**

**Indoor Environmental Quality**

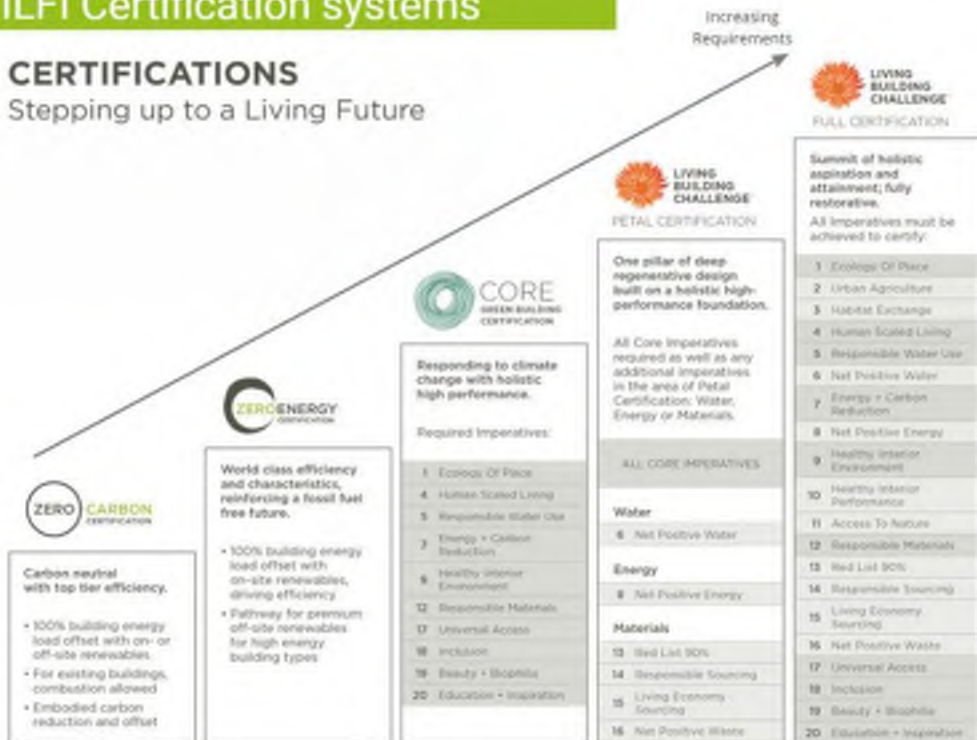

**Innovation + Regional Priority**

| Code   | Requirement                            | Points | Notes    |
|--------|--|--------|----------|
| EA-1   | Integrated Project Planning and Design | 1      | Required |
| EA-2   | Energy Performance                     | 5      | Required |

# ILFI Certification systems

## CERTIFICATIONS

Stepping up to a Living Future

## ILFI Certification systems

### SETTING THE IDEAL AS THE INDICATOR OF SUCCESS

THE LIVING BUILDING CHALLENGE IS A PHILOSOPHY, CERTIFICATION, AND ADVOCACY TOOL FOR PROJECTS TO MOVE BEYOND MERELY BEING LESS BAD AND TO BECOME TRULY REGENERATIVE.

INSTEAD OF A WORLD THAT IS MERELY A LESS BAD VERSION OF THE ONE WE CURRENTLY HAVE- WE ASK A SIMPLE AND PROFOUND QUESTION- WHAT DOES GOOD LOOK LIKE?

12 | Living Building Challenge® 4.0

| Site   |  | Permeable Paving            |  | OPPORTUNITIES                                   |  |  |
|--|--|-----------------------------|--|---|--|--|
| <p><b>Open Space</b><br/>LEED Credit can be obtained by providing 30% or more of open space for the entire site.</p> | <p><b>Bioretention Swales / Rain Gardens</b><br/>These areas to utilize native plants, provide water quality treatment and flow control.</p> | <p><b>Green Roof</b></p>    |  | Plenty of open space to utilize green roofs.    | Reduce the amount of water runoff to the impervious.             | Opportunity to restore the open space area with native and adapted plants. |
| <p><b>Large Shade Trees</b><br/>LEED Heat Island Reduction Credit to shaded paved areas.</p>                         | <p><b>Ethnobotanical Garden</b><br/>Focus on local tribe's native edible plants and their other cultural uses.</p>                           |                             |  | Utilize all stormwater runoff for rain gardens. | Reduce amount of water runoff to impervious.                     | Local vegetation is more green-roofed.                                     |

## Water

**Efficient Plumbing Fixtures**  
Reduce water demand by selecting low-flow or ultra low flow fixtures.

**Efficient Hot Water Heating & Recirculation**  
Reduce hot water consumption by installing high efficient water heaters and circulation pumps.

### RAINWATER HARVESTING

**Rainwater Harvesting**  
Display rain water catchment systems for educational purposes.

**Drought Tolerant / Native Plantings**  
Select plants that will thrive in the PNW climate all year long.

**Advance Water Metering**  
Identify opportunities for improvement through fixture metering.

**Greywater**  
Used water from sinks, showers, etc. without harsh chemicals.

**Rainwater Harvesting**  
Display rain water catchment systems for educational purposes.

**Climate Graph**  
Washington Climate Data

**BASELINE**

**STRETCH GOALS**

**DISCUSSION**

### OPPORTUNITIES

|  |   |   |
|--|---|---|
| Beneficial during wetter years to offset heavy, frequent winter flush. | Depend on climate in years without rain.  | Provide greater durability in older building performance. |
| Consider water use management to see what can be more implemented.     | Water metering can provide insight into water usage, providing feedback to users. | Water independence.                                       |
|  |   |   |
|  |   |   |

### CHALLENGES

|   |   |  |
|---|---|--|
| Soil from rocks and impervious for water runoff.  | Storm water capture is not sufficient for irrigation in PNW (though during time of need). | Storage room required for grey water system. |
| Offering water conservation education, installation, repair, budget or lower air environment. | Increased usage through building reuse, way of water usage.                               |  |
|   |   |  |
|   |   |  |

## Energy

**Washington State Energy Code**  
High-performance envelope, Reduced plug loads + plug load control, Highly efficient HVAC systems with heat recovery, Highly efficient LED lighting systems with automatic reduction controls.

**Additional Efficiency Package**  
More efficient HVAC performance, High efficiency service water heating, enhanced envelope, reduced air filtration, Reduced lighting power, Enhanced digital lighting control, Minimum 43 KW PV array.

**Luminaire Level Lighting Controls**  
Reduced power + student engagement.

**Net Zero Energy (EUI 17-20)**  
The building produces as much or more energy than it uses. Maximize on-site solar PV & High performance HVAC system.

**Passive House Level Envelope**  
High levels of insulation and high-quality windows. Building airtightness, and minimized thermal bridging.

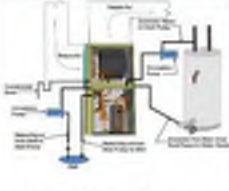

**High performance HVAC**  
Micro district ground source system- constant ground temperature. High system coefficient of performance.

**Decoupled - Separating Ventilation and Space conditioning**  
(Ventilation) Dedicated outdoor air system with heat recovery. (Space conditioning) Air to water heat pump with heating/chilled water system.

**Passive Cooling**  
Reduce the amount of mechanical equipment and take advantage of the PNW temperate climate via windows controls tied to HVAC systems.

**Building/System/Spaces**  
Look for synergies between systems, spaces to minimize and create effective and efficient system.

**Enhanced Commissioning**  
Commissioning agent to facilitate assistance through design, construction and post construction operation to ensure owner intent and quality is met.

**Renewable Energy**  
Reduce environmental and economic impacts through use of renewable energy sources and reduction of fossil fuel energy systems.

**BASELINE**

**STRETCH GOALS**

**DISCUSSION**

### OPPORTUNITIES

|   |   |   |
|---|---|---|
| Generating systems that support learning for the EIU, students and faculty.           | Integrated media systems (TV monitor, speakers) & design. Educational. Collaboration. | Learning a building that goes back on track as it helps to be built and operate.                      |
| Green building systems to maximize energy use potential- water from water from other. | Increased efficiency (20%) to reduce overall building load for heating and cooling.   | Water proofing, fresh-air good light envelope system, take to reduce environmental change, heat loss. |
| Energy independence.  | Enhanced Lighting Control. Color Rendering. State Control. Dimmer/Lighting Design.    | Equipment. Maintenance. Plug loads + heat energy consumption.   |
| Conditioned. Reproductive. 20%+ occupancy. 50%.                                       | Lighting Design with need. LEED v4. Multiple. Integrated. Reporting.                  | Light Pollution. Reduction. Increase. Integration of. Development of. Wildlife.                       |

### CHALLENGES

|  |  |   |
|--|--|---|
| Potential air quality issues for passive cooling/ventilation due to changes and the weather air quality. | Existing soil conditions for ground source air fulfillment.                                      | Creating balance between project goals and sustainability. High performance.                                |

|  |  |  |
|  |  |  |

**Mass Timber**  
The use of CLT and heavy timber is advantageous for both the low carbon impact and biophilic design properties.

**Low Carbon Concrete**  
There are enough lower carbon mixes available now that amount to a 30% carbon reduction for little or no additional cost.

**Embodied Carbon - Lucy Covington Leadership House**  
Potential carbon reductions of 16-26% as compared to other construction types.

BASELINE
STRETCH GOALS
DISCUSSION

## Health

**Acoustical Performance**  
Promote occupant well-being, productivity and communications through acoustic design.

**Local Materials**  
Within 500 miles or in WA State

**Certified Wood**  
50% FSC in structure, blocking, & finishes

**Major Causes of Sick Building Syndrome (SBS)**

**Maximize Indoor Air Quality**  
Provide strategies to eliminate SBS factors such as more efficient filtration, walk off mats, operable windows, CO2 monitoring and increased outside air ventilation.

**Design for EQUITY**  
Meet ADA requirements and Universal Design Principles

**Thermal Comfort**  
Promote occupant productivity and well-being through efficient thermal comfort design.

**Red List Free**  
Specify Certified: Red List Free, Living or Petal Certified products & materials (amount per LBC)

**Declare.**

**Specify responsible and transparent**  
Set targets and prefer products and manufacturers that:  
- provide transparency (EPD, Declare, HPD, C2C)  
- demonstrate equitable labor practices

**Circadian Lighting Design**

- Higher Productivity
- Improved memory & cognitive function
- Better metabolic health
- Improved Mood

**Just.**

**Prefer JUST**  
Just Diversity certified team members, certified workforce / MWBE

**Access to daylight & fresh air for all regularly occupied spaces**

- Consider operable windows.
- Meet ASHRAE IAQ requirements

**Incorporate Biophilia**  
Connection with nature through natural forms, materials and replicating natural processes.

**Potential air quality issues for operable windows, doors, allergens and the occupant health.**

## Section 1

# Executive Summary

### Key Takeaways

- The decarbonization plan will identify a path to meet EWU's goal of carbon neutrality, and to comply with Washington State HB1390 legislation.
- This is an intermediate deliverable, providing supporting info for the 2025-2027 capital request.
- The preferred decarbonized system is a nodal open-loop geothermal system – the cost of that system is part of a separate request (the Geothermal Node Plant request).
- The budgetary cost of ~\$20,000,000 noted in this report is to connect the first nine buildings to the geothermal system and implement energy efficiency measures. This does not include the cost of the geothermal plant itself.

## Executive Summary

### Introduction and Report Purpose

Eastern Washington University is developing a decarbonization plan with the long-term goal of eliminating fossil fuels at its central heating plant. This plan will not only help EWU achieve its goal of becoming a carbon neutral institution but will also align with the requirements of Washington State's House Bill 1390. This report outlines EWU's preferred decarbonized system vision and provides rough order of magnitude (ROM) costs for connecting the first group of existing buildings to that system and implementing energy efficiency measures. **The preferred decarbonized system is a nodal open-loop geothermal system. The cost of the geothermal plant itself and the associated distribution piping is being developed via the Geothermal Node Plant request. The ROM cost to convert the nine buildings in Figure 1 to the new plant is roughly \$19,800,000.** These are "all in" costs, reflective of the total cost EWU can expect when implementing these projects. Costs at this stage are for budgetary purposes, and will need to be refined during the next stage of development/implementation.

Figure 1: Buildings Connecting to First Geothermal Node

### Key Considerations

- **Capital Request:** This report provides the ROM costs for converting nine existing buildings (see Figure 1) for connection to the first nodal geothermal plant. It also includes the cost of implementing specific energy efficiency measures, which should be implemented simultaneously with the building conversions for optimal value. The cost of the plant and other projects are budgeted through separate efforts as follows:
  - The cost of the first geothermal nodal plant and the associated distribution piping is being provided via the Geothermal Node Plant request.
  - The cost for converting the Martin/Williamson building and connecting it to the first plant is included in a separate Pre-design Estimate (not included here).
- **House Bill 1390 Compliance:** This report forms the basis for the Decarbonization Plan (required for HB 1390 compliance) that will be submitted to the Department of Commerce in 2025. In addition to the long-term goal of removing natural gas, the campus will also need to meet an **EUI target of 112 kBtu/sf/yr (to be confirmed with Commerce)** and to establish **Energy Management and Operations & Maintenance Plans (EMPOM)**. ***Converting these buildings and implementing the recommended nodal geothermal system will meet the EUI target required for HB 1390 compliance.*** Key dates for 1390 compliance include:
  - 6/1/25: EMPOM period for buildings over 220,000 sf starts (outside the scope of this project)
  - 6/30/25: **Decarb plan** due to Commerce (**in progress**)
  - 2026 and 2027: EMPOM periods start for buildings 90,000 sf - 220,000 sf and 50,000 sf - 90,000 sf (outside the scope of this project)
  - 2030 and 2035: **Decarb Plan** update due to Commerce
  - 2040: Decarbonized campus, EUI target met
- **Funding:** Design and construction of the preferred decarbonized system depends on the State of Washington's continued support of decarbonization efforts (including geothermal technology). Geothermal projects are eligible for federal funding via the Inflation Reduction Act. A tax consultant can quantify the exact funding amount, depending on project phasing and construction. This report does not quantify those benefits.
- **Phasing:** The preferred geothermal nodal system is ideal for long-term phasing. This allows for the cost to be spread out over multiple biennium and provides flexibility in project implementation and sequencing.
- **Capital planning:** The decarbonization plan and capital planning will be strategically aligned. For instance, the demolition of older, less efficient, underutilized buildings not only supports the decarbonization objectives by reducing campus energy consumption but also offsets the costs associated with upgrading these less efficient structures to the new decarbonized system.

## Executive Summary

### Preferred System

Based on the work done to date, a **nodal open-loop geothermal mechanical system** is the preferred system for reducing reliance on fossil fuels at a campus scale. The key components of this system include:

- **Open-Loop Geothermal:** The system will extract and reject heat to and from the aquifer beneath the campus. Electrically-powered water-to-water heat pumps will create heating hot water that will be distributed to individual buildings. This is opposed to the current heating system, which creates heat by burning fossil fuels. **This recommendation is based on the analysis performed in the previous geothermal study, which will need to be validated eventually by a geothermal test well.**
- **Nodal Plants:** The mechanical equipment needed to transfer the heating/cooling to the buildings will be in several smaller plants distributed across campus. This is opposed to the current plant configuration, which houses all heating/cooling equipment in a single central plant building. This approach allows for construction phasing, flexibility, and increased campus resilience.
- **Transitioning from Steam to Hot Water:** The current central system provides building heating primarily via steam. The proposed system will provide heating to buildings via hot water, removing steam as the primary source of heating. This will require new hot water distribution piping across campus. This will most likely employ a mix of low temperature hot water (i.e. 120-130°F) and high temperature hot water (i.e. 160-180°F), depending on the existing mechanical systems in the buildings.
- **Resiliency:** The existing central steam plant will remain in-place to provide backup to the decarbonized system. EWU recently received grant funding to install a carbon capture system on the existing fossil fuel-fired steam plant. In addition, if economics and supply become viable, the steam plant could be fired by renewable natural gas.
- **Cost, Incentives, Construction:** The proposed strategy's modular nature enables a gradual rollout that can be synchronized with the capital budget cycle, extensive renovations, and new construction, allowing for less impact to campus. The system is well-positioned for funding from the Inflation Reduction Act, ensuring the most cost-effective use of resources.

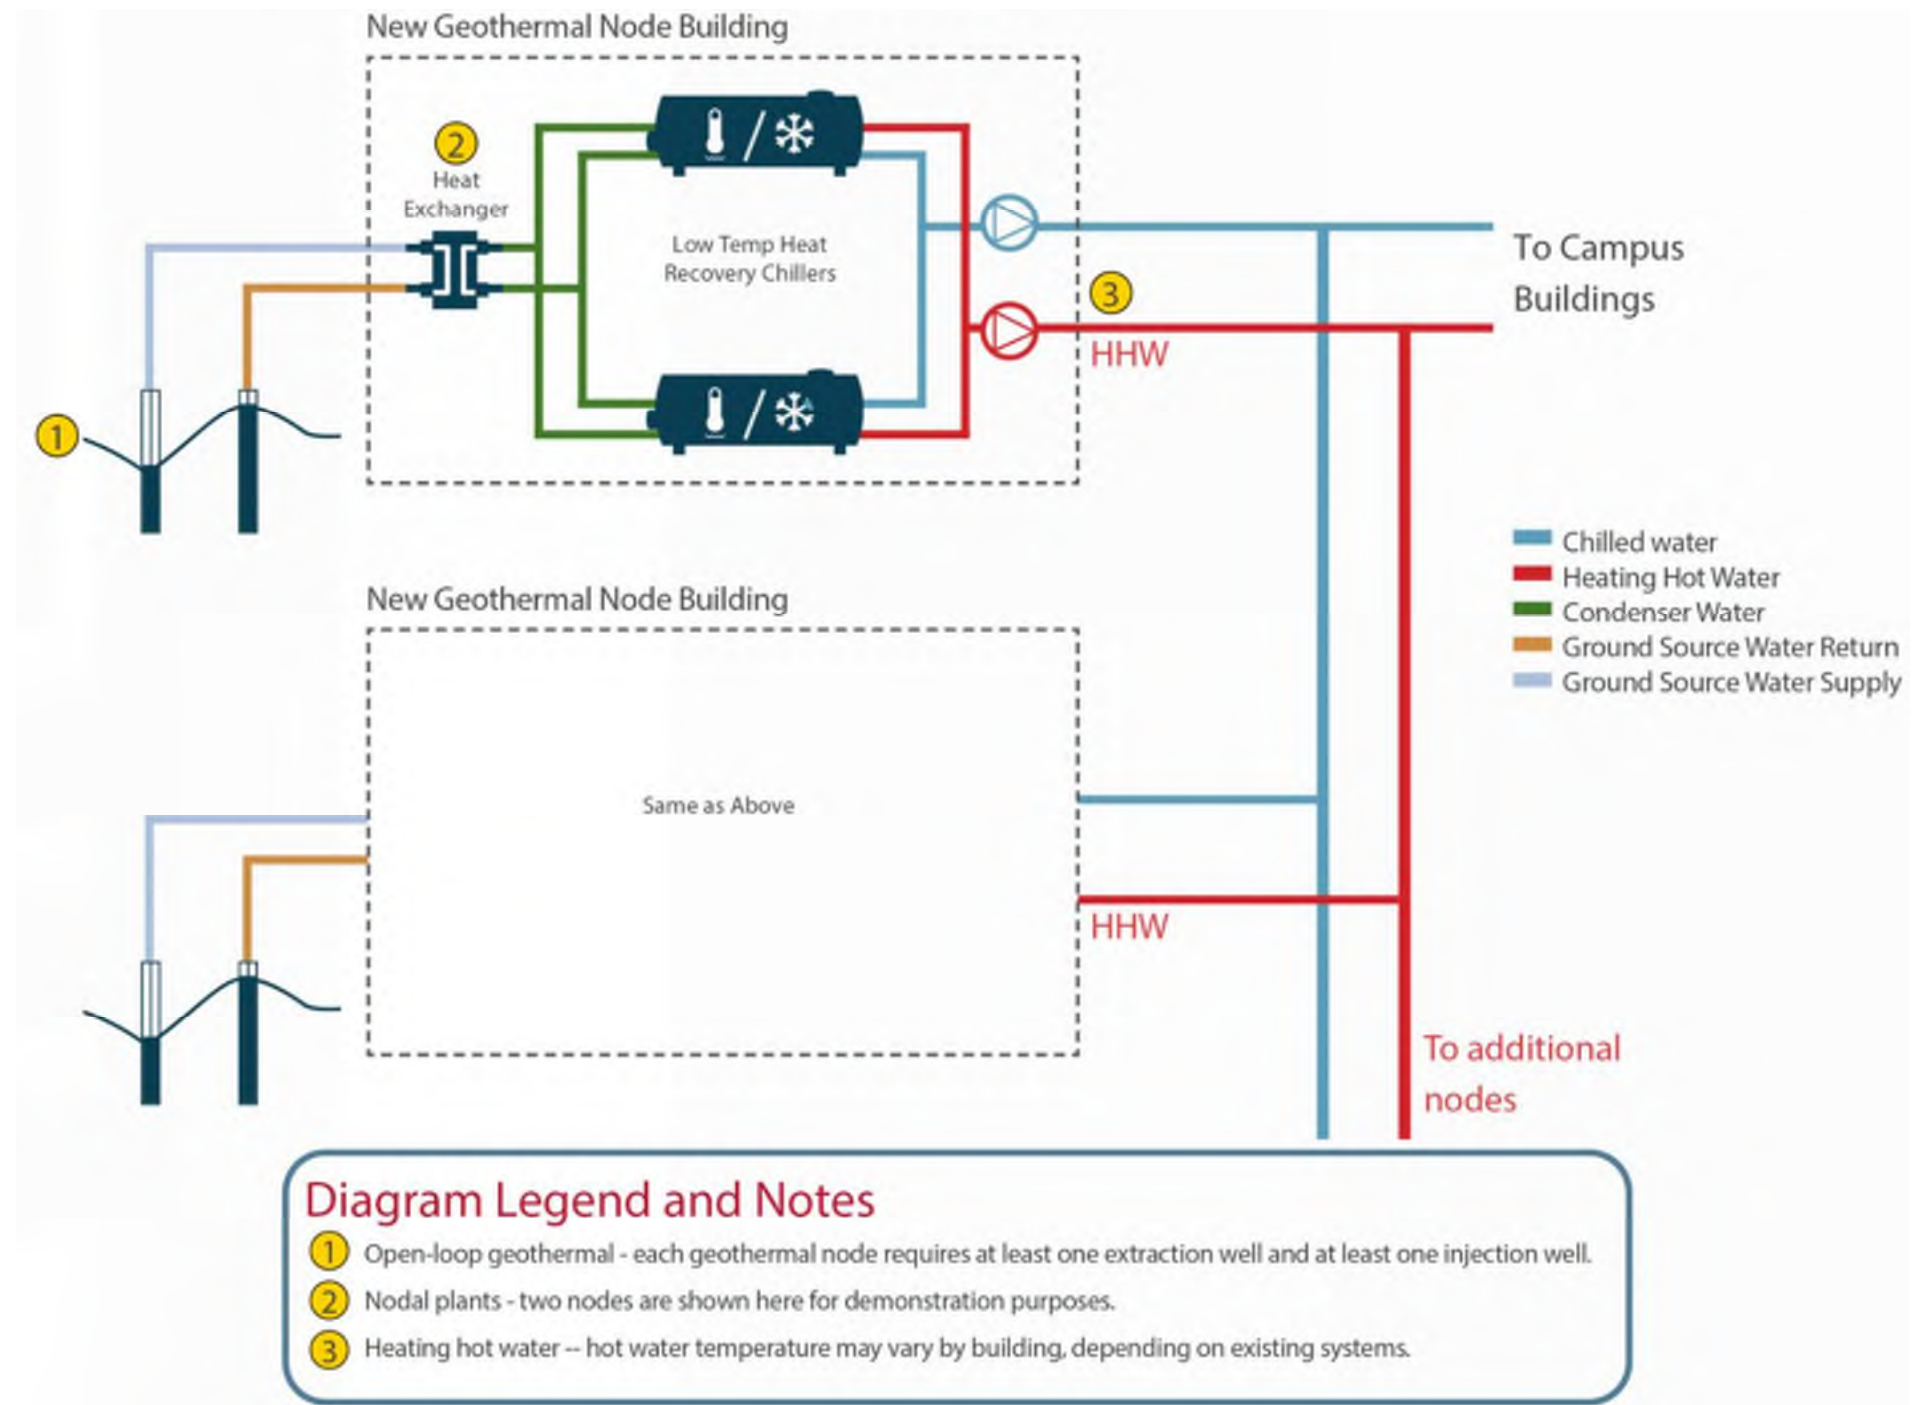

Figure 2: Proposed Nodal Plant Configuration

## Executive Summary

### In-Building ROM Costs

Table 1 presents the turnkey renovation ROM costs to convert the existing buildings to the preferred decarbonized system and implement recommended energy efficiency measures. The extent of these retrofits, the decision-making process behind them, and the recommended measures are described in Section 4 of this report. **These are “all in” costs, reflective of the total cost EWU can expect when implementing these projects. They are ROM costs for budgetary purposes, which will need to be refined during the next stage of development/implementation.** Additional cost estimating info is provided in Section 4 and the Appendices.

### Project Next Steps

- Further define preferred decarbonized system and coordinate with utility.
- Further develop decarbonization plan for submittal to Commerce in May 2025.
- Construct test well to validate recommended system approach.

Table 1. In-Building Retrofit ROM Costs.

|     | Building                | Building Area [s.f.] | Renovation Cost [\$] |
|-----|-------------------------|----------------------|----------------------|
| JFK | JFK Library             | 124,496              | \$ 2,900,000         |
| CEB | Computing & Engineering | 98,476               | \$ 4,500,000         |
| MUS | Music Building          | 47,618               | \$ 2,400,000         |
| THE | University Theater      | 41,164               | \$ 1,900,000         |
| ART | Art Building            | 34,469               | \$ 3,100,000         |
| SUT | Sutton Hall             | 31,927               | \$ 900,000           |
| HUS | Huston Hall             | 27,424               | \$ 1,700,000         |
| CMC | Communications Building | 19,289               | \$ 1,100,000         |
| RTV | Radio/TV Building       | 16,980               | \$ 1,100,000         |
|     | <b>Total</b>            |                      | <b>\$ 19,600,000</b> |

## Section 2

# Campus Existing Conditions

---

### Key Takeaways

- The existing steam heating system accounts for 95% of Scope 1 campus carbon emissions and ~70% of Scope 1 and 2 carbon emissions.
- The campus is heating-dominated with spare steam capacity.
- The campus electrical system has significant capacity available to accommodate added loads.

### Campus Energy Use

The EWU campus is served by electricity from the City of Cheney and natural gas from Avista. The central plant provides most of the heating and cooling on campus. Natural gas is consumed at the central utility plant to produce campus steam. Natural gas is also used in a smaller magnitude throughout campus at individual buildings for domestic hot water heating systems, process loads, and for cooking. Campus data below is based on utility bill data and Department of Ecology reporting.

Figure 3: Annual Primary Energy Use

### Campus Energy - Enduse Breakdown

The sankey diagram to the right shows how energy is used across the EWU campus. While there are some disparate fossil fuel (natural gas) uses across campus, the majority of fossil fuel use is attributed to the central steam plant loop. Note this diagram does not include campus vehicles using fossil fuels, as that usage is outside the scope of this project. For the electricity and gas breakouts in this chart, data is based on:

- Natural gas: the breakout between district heat and remaining gas is based on utility data.
- Electricity: the breakout between electricity and district cooling is based on similar campuses. It has been adjusted to account for Cheney’s cooling degree days.

Figure 4: EWU Sankey Diagram of Campus Primary Energy Use

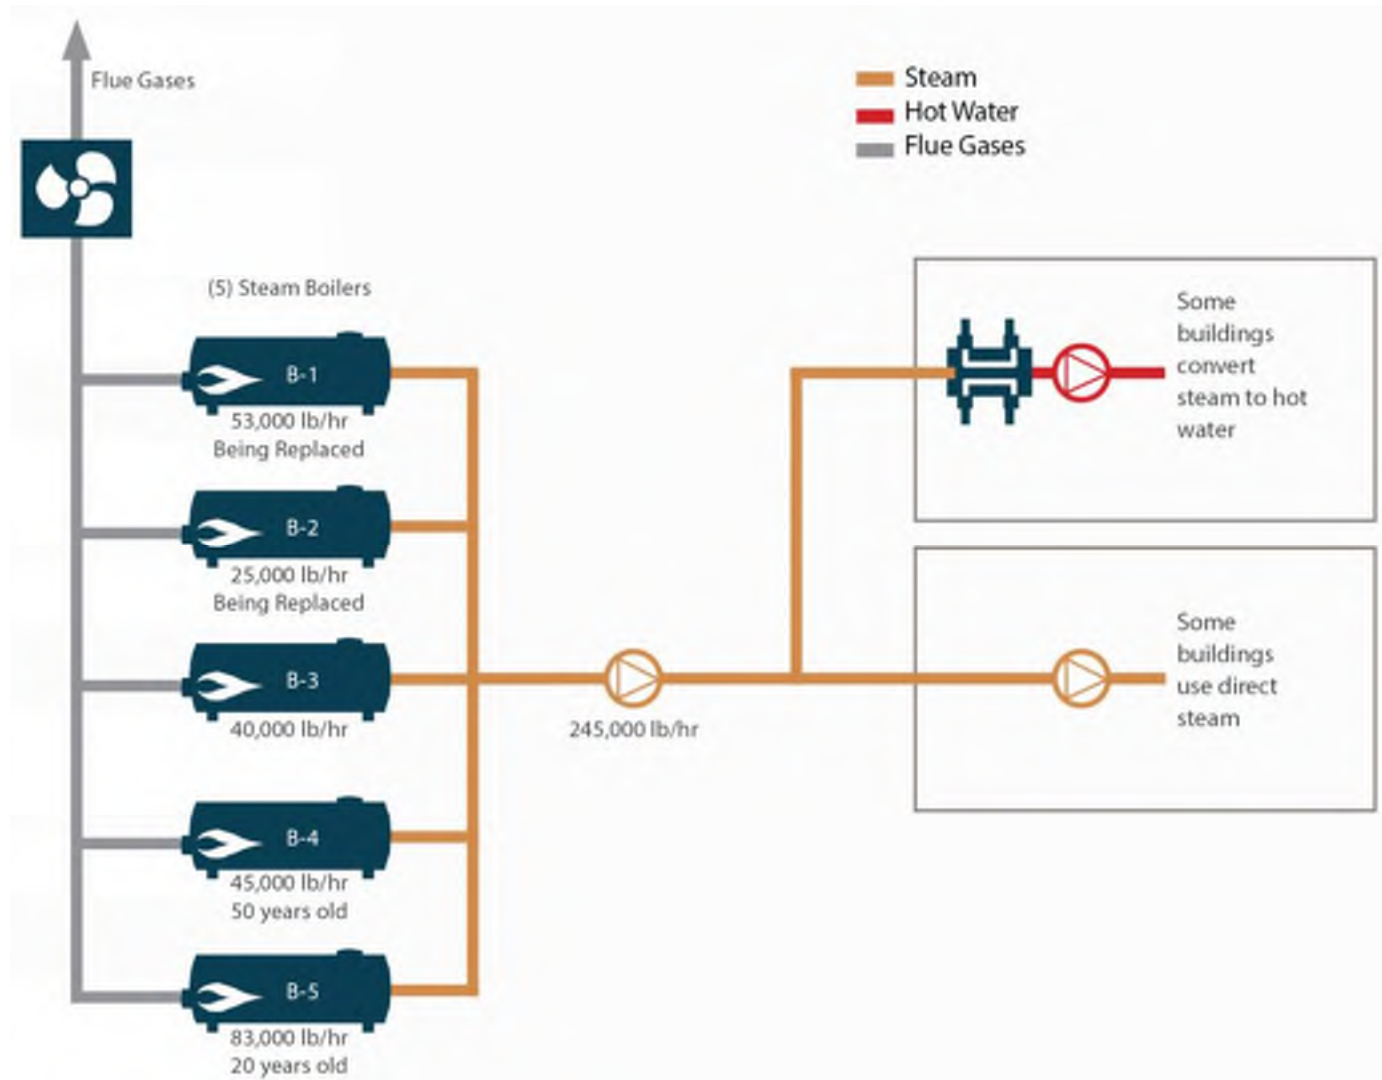

Figure 5: Diagram of Existing Campus Heating System

### Campus Heating

Most of the campus (2.6 million sf) is served by the central steam heating plant at the Central Rozell Energy Plant. This plant consists of five (5) high-pressure steam boilers with a total capacity of 245,000 lb/hr. The boiler ages vary, and boilers 1 and 2 are in the process of being replaced with new gas-fired boilers. The highest observed steam load on campus was approximately 75,000 lb/hr. Steam is distributed to campus via the utilidor system. While some buildings have hydronic heating via steam to hot water converters, many buildings receive heating via direct steam coils. Steam condensate is pumped back to the central plant for collection, at an estimated return rate of 92%.

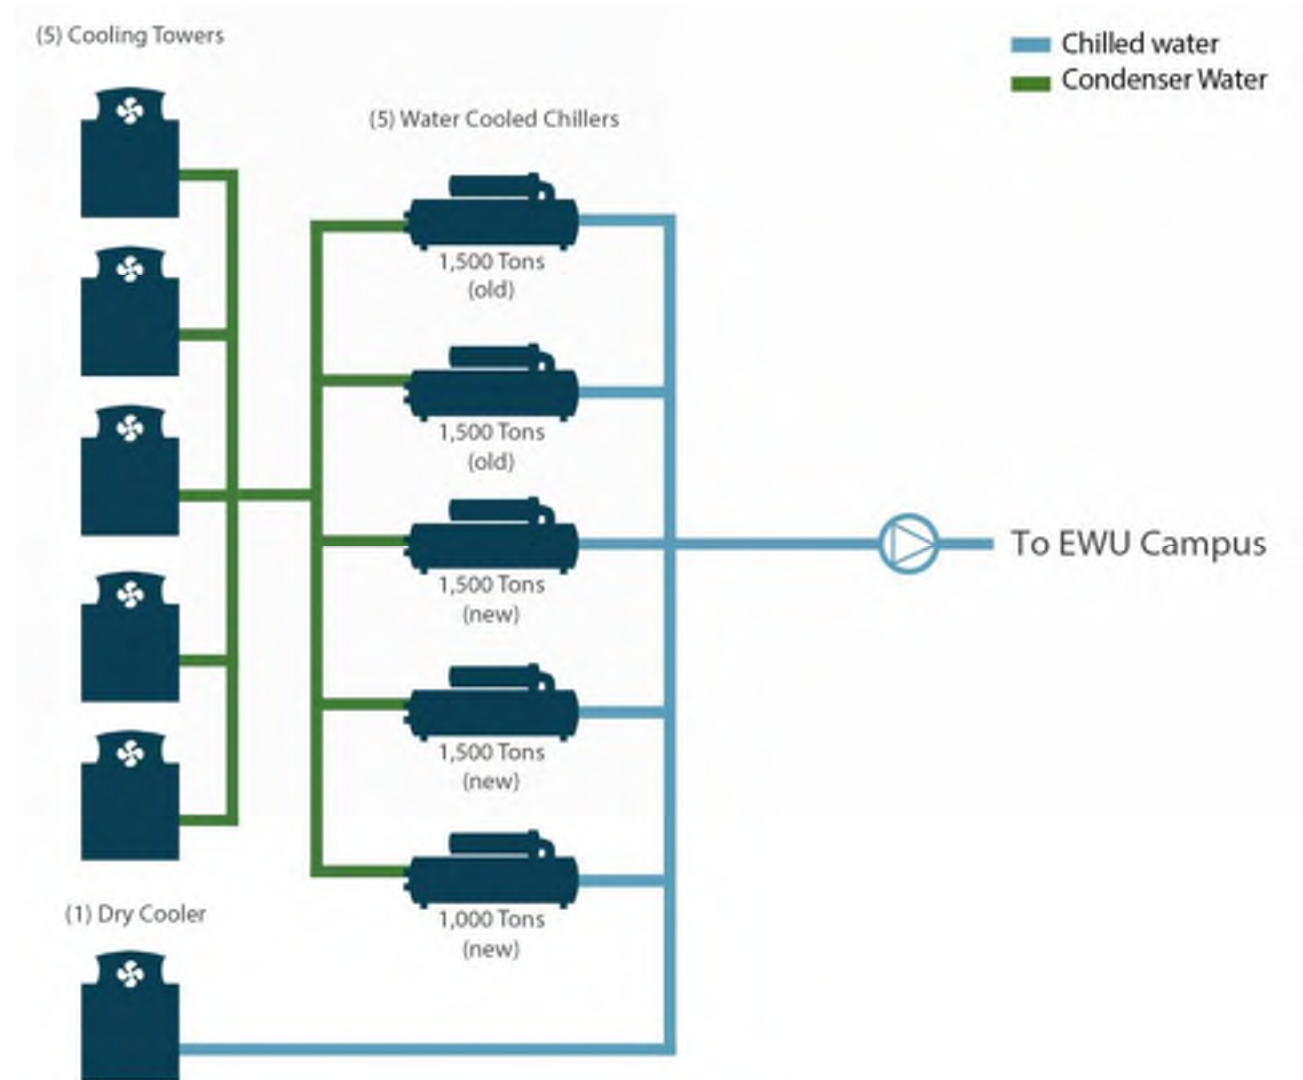

Figure 6: Diagram of Existing Campus Cooling System

### Campus Cooling

Most of the campus (2.1 million sf) is served by the central chilled water system at the Central Rozell Energy Plant. Residence halls are the main exception, as most do not have cooling. This plant consists of five (5) water-cooled chillers and open draw-thru cooling towers for a total capacity of 7,000 tons. The chiller plant is in the process of several modernization and energy upgrades, including water-side economizers and variable speed chillers and pumps. The chillers are turned off October thru April, and winter cooling is provided by a separate dry-cooler unit, with glycol anti-freeze protection. The connected buildings do not have heat exchangers for isolation, and chilled water is typically fed directly into the building's HVAC systems.

Summary of Campus Electrical Infrastructure

The existing campus electrical infrastructure at Eastern Washington University is powered via two service entrance points from two different City of Cheney Substations. Each service consists of a 600A, 13.2kV metal enclosed switchgear . The first service is located at Red Barn and powered from the Turnbull Substation. The second is located at Rozell and powered from the 4 Lakes Substation. Each of the two services feeds either of the two busses within a double-ended 1200A 13.2kV switchgear. This switchgear provides distribution to the remainder of the campus. In addition to powering this switchgear, the Rozell services also provides a 4000KVA feeder to the Rozell Chiller Plant.

Each service has the capacity to deliver up to 13.7MVA to the campus, for a total combined capacity of 27.4 MVA. Utility metering data was reviewed over the course of the year from May 2023 to April 2024 and the peak electrical demand was observed for both services. These values helped to determine the existing utilization of each of the electrical services. Significant capacity exists on both services to accommodate additional electrical load, and the campus loop is designed to allow for physical expansion on either end of the service switchgear busses. Further study will be conducted to calculate the total added electrical load from decarbonization, and will determine if the existing campus infrastructure is sufficiently sized to accommodate the new load

Figure 7: Red Barn and Rozell Plant Capacity Analyses

## Section 3

# Decarbonization Solution – Energy Plant

---

### Key Takeaways

- The preferred system is an open-loop geothermal system with nodal plants.
- A wide variety of heat sources and sinks were considered, and a qualitative comparison was performed for three options to determine the preferred option.
- The added electrical load to the campus infrastructure has not yet been evaluated. This will be analyzed later in this project.

# Decarbonization Solution | System Scoring Summary

## System Scoring Summary

As described in the following pages, several system options were considered for heat sources/sinks and plant configuration. For each system component, the options analysis answered the following key questions:

**Heat Sources and Sinks:** How will EWU generate heating and cooling?

**Plant Configuration:** Will the decarbonized system have a central location, or will it be dispersed across campus?

Based on this exercise, and with the approval of EWU, the preferred system is a nodal open-loop geothermal system.

### Heat Sources & Sinks

Recommendation

### Plant Configuration

Recommendation

## System Scoring Criteria

Table 2 presents the scoring criteria and weightings used to determine the preferred system. These criteria were developed with EWU Construction, Planning, and Facilities groups input and considers the University's priorities and preferences.

Table 2: Relative Weights for Scoring Criteria

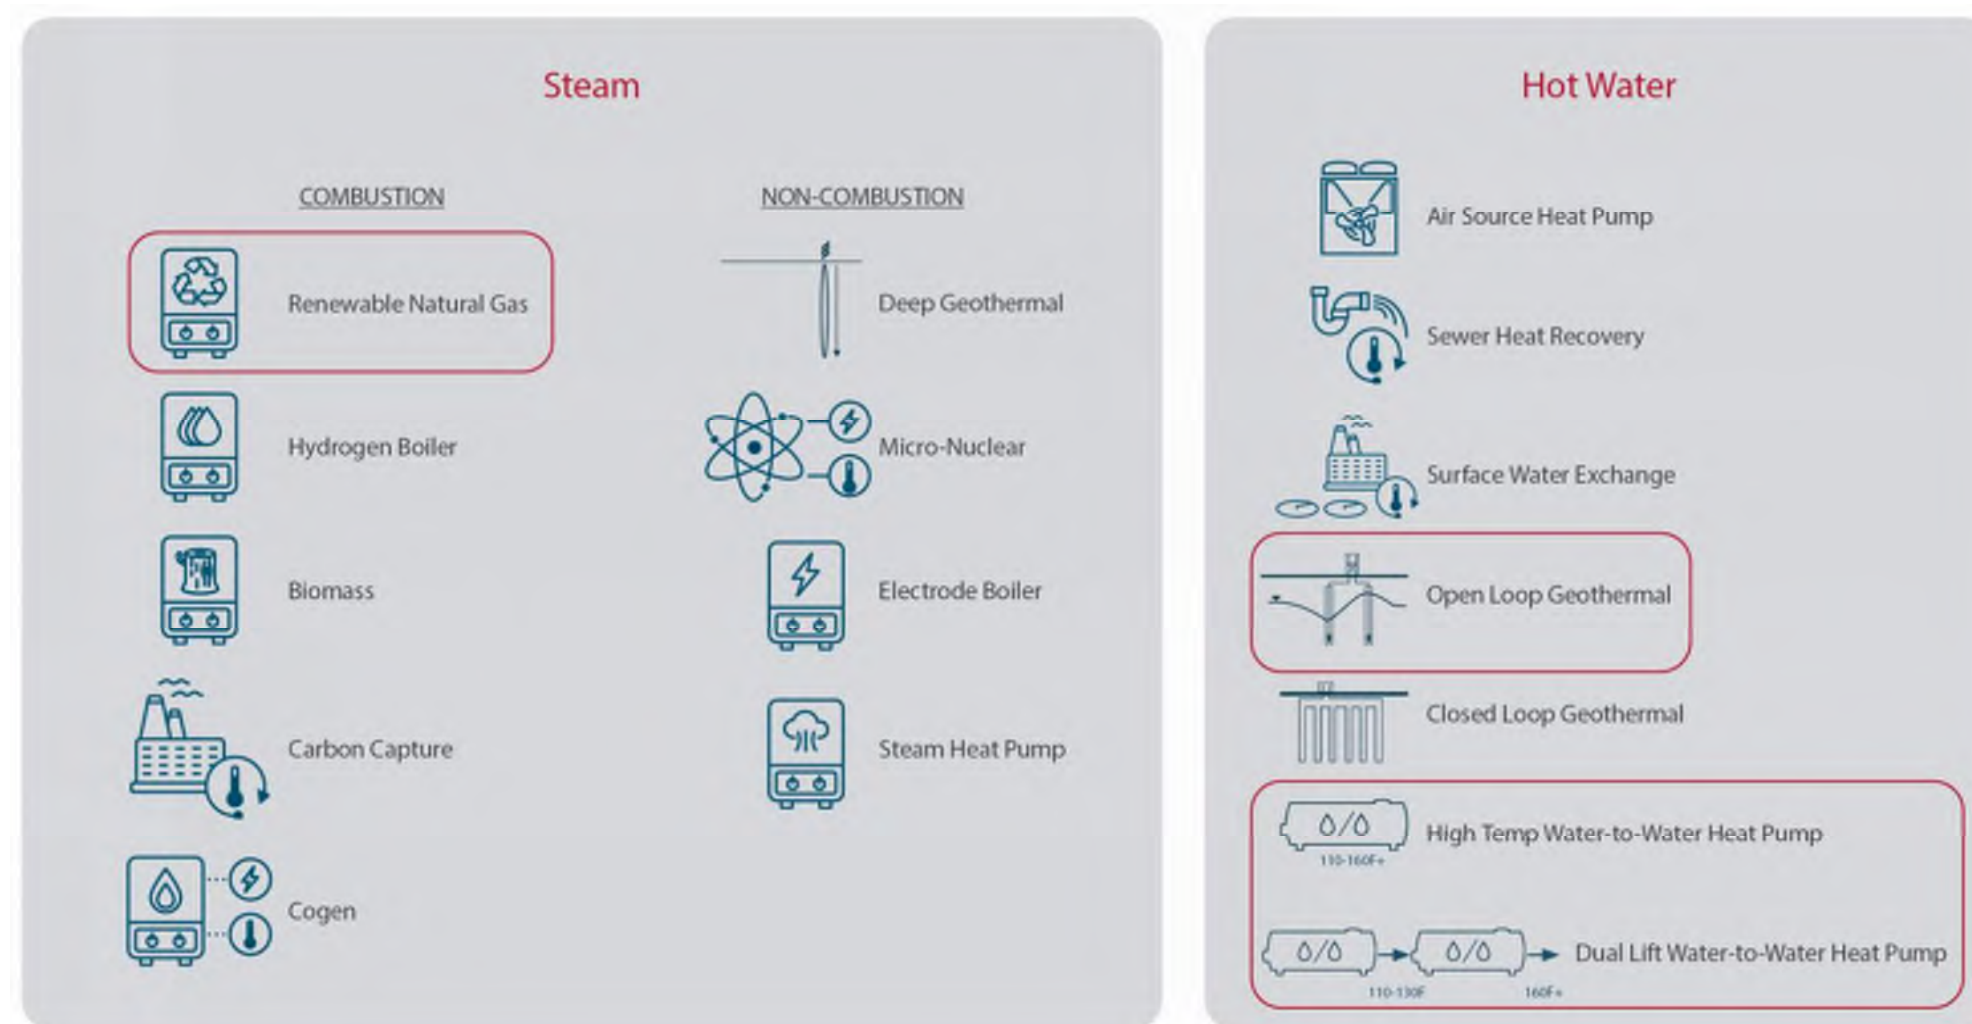

| Scoring Variable                  | Weighting |
|-----------------------------------|-----------|
| First Cost                        | 30%       |
| Utility Cost                      | 20%       |
| Maintenance Cost                  | 20%       |
| Carbon Cost Effectiveness         | 10%       |
| Teaching / Curriculum Opportunity | 20%       |

**System Considerations**

Heating is currently provided by fossil fuel-fired steam boilers, which are a prime source of scope 1 carbon emissions. Transitioning that fossil fuel-based system to one not requiring natural gas is a primary piece in driving decarbonization on campus. Since EWU receives electricity from a utility that is powered predominantly by hydropower, transitioning the gas-based system to an electrified system is a key strategy for decarbonization. The system options list below summarizes the systems considered for electrification of the EWU heating system. Qualitative scoring for three options is included on the next page, followed by a complete list of options with further context. **Based on this analysis, open-loop geothermal is the preferred electrified system. Note: this recommendation must be validated by favorable results from a geothermal test well.**

**System Options**

Systems that would maintain the steam distribution system, as well as those that would transition heating from steam to hot water were considered. In addition, the temperature of the hot water was considered, as different technologies have different capabilities. Based on guidance from EWU, the systems in red boxes in the figure below were compared qualitatively, as shown on the next page.

**Low Temperature vs High Temperature Hot Water**

When switching from steam to hot water the temperature of that water is a critical consideration. Many of EWU’s buildings currently have mechanical systems with direct steam heating. These buildings will require more invasive mechanical system retrofits to switch from steam to hot water. The retrofitted hot water system should be low temperature. Other scenarios will need to be considered on a case-by-case basis. The first nine buildings for conversion are described in the next section of this report.

Low Temperature Hot Water (LTHW)

- Least amount of mechanical plant equipment needed.
- Some existing hot water systems may be able to operate on lower temperatures, requiring minimal in-building upgrade. For those that can’t, and for existing steam systems, LTHW may require significant in-building retrofits.
- Mandated for new construction buildings in Washington State.

High Temperature Hot Water (HTHW)

- Requires either two-stage heating systems (with two pieces of equipment), or high temperature heat pumps, which are an emerging technology.
- Does not usually require invasive retrofits to existing in-building mechanical systems.
- Of the buildings that currently have hot water, most operate with HTHW.

## Decarbonization Solution | Heat Sources & Sinks Scoring

The heat source/sink analysis compared the relative merits of three systems qualitatively and scored them against performance criteria identified in collaboration with EWU stakeholders. Table 3 presents the results of the scoring analysis.

Table 3: Relative Scoring of Decarbonization Strategies

| Geo + Low Temperature Hot Water (LTHW)   | Geo + High Temperature Hot Water (HTHW)  | Steam via Renewable Natural Gas   |
|--|--|---|
| <b>Recommendation</b>  |  |   |
| While low temperature hot water is the best-scoring option, most likely the solution will use a mix of low temperature and high temperature hot water, depending on existing building systems. A low temperature hot water system depends on the operating conditions of in-building heating systems, as some buildings may need extensive retrofit to accommodate a low temperature heating system. |  |   |
| <b>Description</b>   |  |   |
| Open loop geothermal with water-to-water heat pumps providing 110-130F hot water.  | Open loop geothermal with water-to-water heat pump(s) providing 160F+ hot water. Bringing hot water up to high temperatures may be achievable with a single heat pump or may require two heat pumps in a dual-lift configuration.  | Renewable natural gas (RNG) boilers to provide steam to existing systems.<br><br>As it is currently written, HB 1390 only allows for 10% of annual heating to be provided by gas or electric resistance. Commerce has not yet provided guidance on alternative fuels.   |
| <b>First Cost</b>  |  |   |
| \$\$\$\$   | \$\$\$\$   | \$  |
| <b>Utility Cost</b>  |  |   |
| \$   | \$   | \$\$\$\$\$  |
| <b>Maintenance Cost</b>  |  |   |
| \$\$\$   | \$\$\$\$   | \$\$\$\$\$  |
| <b>Carbon Cost Effectiveness</b>   |  |   |
| High   | Medium   | Low   |
| <b>Teaching / Curriculum Opportunity</b>   |  |   |
| High   | High   | Low   |
| <b>Overall Score</b>   |  |   |
| <b>3.70</b>  | <b>3.10</b>  | <b>2.20</b>   |
| <b>Advantages</b>  |  |   |
| <ul style="list-style-type: none"> <li>- More efficient</li> <li>- Less electrical load</li> <li>- Fewer pieces of equipment</li> <li>- Provides cooling and heat recovery</li> </ul>  | <ul style="list-style-type: none"> <li>- Fewer pieces of equipment</li> <li>- Avoids potentially expensive in-building retrofits</li> <li>- Provides cooling and heat recovery</li> </ul>  | <ul style="list-style-type: none"> <li>- Familiar Technology</li> <li>- Avoids potentially expensive in-building retrofits</li> </ul>   |
| <b>Disadvantages</b>   |  |   |
| <ul style="list-style-type: none"> <li>- Will require some substantial/significant building retrofits to convert to LTHW</li> <li>- Assuming new pipes can't fit in existing tunnel, will require sitework to install new distribution piping.</li> </ul>  | <ul style="list-style-type: none"> <li>- High temperature heat pumps are an emerging technology</li> <li>- Higher equipment first cost</li> <li>- Higher O&amp;M costs</li> <li>- Dual-lift systems would need additional space</li> <li>- Assuming new pipes can't fit in existing tunnel, will require sitework to install new distribution piping.</li> </ul> | <ul style="list-style-type: none"> <li>- Current RNG price 5 to 7 times higher than natural gas. Price needs to come down significantly.</li> <li>- RNG supply is not currently mature. System is reliant on utility's ability to provide sufficient RNG.</li> <li>- Boiler System is a heating-only solution that offers no benefit to the central chilled systems. Does not allow for heat recovery.</li> <li>- High maintenance costs in the plant, distribution piping, and in building systems.</li> </ul> |

## Decarbonization Solution | Heat Sources & Sinks Technology Options

Heat can be introduced to the campus from a wide variety of possible sources via a wide variety of technology. Table 4 presents the options considered for the EWU campus and considerations for their applicability.

Table 4: Heating Technology Options

|           |                | Concept  | Heating? | Cooling? | Suggested Action                     | Notes   |
|-----------|----------------|--|----------|----------|--------------------------------------|---|
| Steam     | Combustion     | Renewable Natural Gas Boilers                            | Yes      | No       | Evaluate Qualitatively               | Currently utility RNG market is not mature in local market. With HB 1589 passed, gas utilities may evolve in the near future. Limitation of current options puts resiliency at risk. Additionally, HB 1390 has not ruled on validity of alternative fuels that use combustion. Gasification of biomass is possible, but will be space intensive and have similar challenges as biomass boilers.   |
|           |                | Biomass Boilers  | Yes      | No       | Fast Fail                            | Requires consistent supply, is labor-intensive, and requires large footprint for boiler feed. There is also debate as to whether biomass is carbon-free. Additionally, HB 1390 has not ruled on validity of alternative fuels that use combustion.  |
|           |                | Hydrogen Boilers   | Yes      | No       | Fast Fail - Not At Scale Yet         | Provides resiliency through hydrogen storage, but is not commercially viable at scale yet. CU Boulder is currently undertaking a pilot program for research purposes. Additionally, HB1390 has not ruled on validity of alternative fuels that use combustion.  |
|           |                | Cogeneration Boilers                                     | Yes      | No       | Fast Fail                            | Provides campus resiliency through on-site power generation, and also reduces electrical load on City Utility. Burns fossil fuels to create heating, so cannot be used for HB 1390 compliance   |
|           |                | Carbon Capture   | Yes      | No       | Pilot Project Underway               | EWU was recently awarded grant funding to design and construct a carbon capture system for the existing fossil fuel-based steam boilers.  |
|           | Non-Combustion | Deep Geothermal  | Yes      | No       | Fast Fail                            | Deep geothermal is possibly feasible, but requires further study and would most likely have a large first cost. It is currently more suited for utility scale.  |
|           |                | Micro-Nuclear  | Yes      | No       | Fast Fail                            | Microreactors (5-10 MW) are currently in early stage of design/development. Won't be available until late 2020's/early 2030's at the earliest   |
|           |                | Electrode Boiler   | Yes      | No       | Fast Fail - Not Allowed by 1390      | Can only contribute 10% of annual heat input per HB 1390 requirements, not a solution on its own. Likely improves overall plant heating efficiency ~15-20%. EWU already evaluated this (before 1390) and found it too expensive.  |
| Hot Water | High Temp      | Heat Exchange Source + High Temp Heat Pump (Single Lift) | Yes      | Yes      | Evaluate Qualitatively               | High-temperature heat pumps are a quickly emerging technology. While typically used for industrial applications, manufacturers are quickly providing new models with better performance for higher education applications.  |
|           |                | Low Temp HW (LTHW) + Secondary Heat Pump (Dual Lift)     | Yes      | Yes      |                                      | 1st step heating can be any LTHW concept (e.g. geothermal). 2nd step heat from LTHW to HTHW achieved via water-to-water heat pumps (WWHP) in each building or at certain nodes. In-building WWHPs limited by available mech room space and electrical capacity.   |
|           |                | Steam Heat Pump (Single Lift)                            | Yes      | No       | Future Consideration                 | Similar to High Temp heat pump, these are being seen first in industrial applications and emerging quickly. Development for commercial applications is slightly lagging behind high temp heat pumps.  |
|           |                | Low Temp HW + In-Building Elec Boiler (Dual Lift)        | Yes      | No       | Future Consideration                 | In-building electric heating is not limited by HB 1390. 1st step heating can be any LTHW concept (e.g. geothermal). 2nd step heat from LTHW to HTHW achieved via electric boiler/heating in each building or at certain nodes. In-building electric heating limited by available mech room space and electrical capacity. Electric boilers are significantly less efficient than WWHPs and aren't ideal for two-step controllability. Could be considered in future phase if mechanical room space becomes a limiting factor for the WWHP option. |
|           | Low Temp       | Open Loop Geo-Exchange                                   | Yes      | Yes      | Evaluate Qualitatively               | EWU conducted a geothermal evaluation with system options, which found the aquifer beneath campus could have capacity to meet campus heating/cooling needs. The findings of the evaluation are based on computer modeling and available data, and need to be validated via geothermal test well.  |
|           |                | Closed Loop Geo-Exchange                                 | Yes      | Yes      | Fast Fail - Open Loop is More Viable | More costly per unit capacity than open loop and requires significantly more site area. Viable option for sites that don't have a viable open loop aquifer.   |
|           |                | Air-to-Water Heat Pump                                   | Yes      | Yes      | Future Consideration                 | Could be included for peaking heating/cooling loads in campus system, depending on aquifer viability and total system cost. Viable option for standalone buildings not connected to campus system.  |
|           |                | Surface Water Exchange                                   | No       | Yes      | Fast Fail                            | EWU campus is not directly adjacent to a significant body of water.   |
|           |                | Campus Sewer Heat Recovery                               | Yes      | Yes      | Fast Fail                            | Campus sewer line would have insufficient flow to make a meaningful impact. Makes more sense for sites that are near very large citywide sewer lines. Otherwise, the added maintenance and cost are not worth the energy recovered.   |

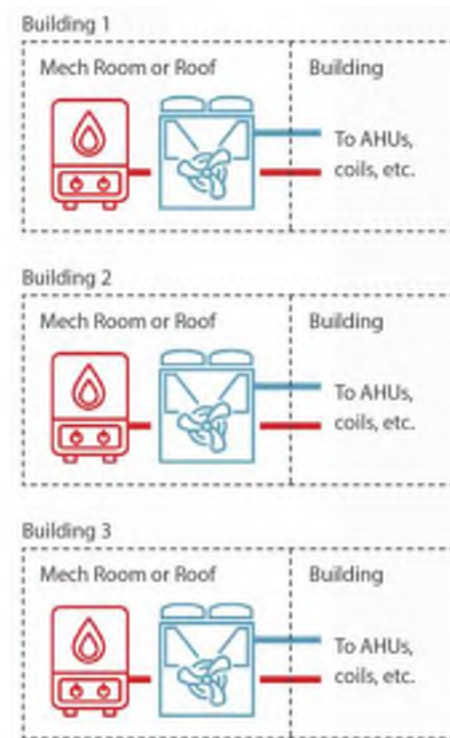

## Decarbonization Solution | Plant Configuration Options

The plant configuration dictates where the heating/cooling equipment is located and the general quantity of pieces of equipment. The existing heating/cooling system is centralized, with all the main equipment located in the Rozell Energy Plant. The main tradeoffs between a centralized plant and several smaller distributed plants include maintenance, phasing, and space requirements. **The nodal system is preferred, largely due to its flexibility and phase-ability, as well as the opportunity to showcase decarbonization to the campus.**

### Centralized

A centralized system houses all heating and cooling equipment in a single location. This allows for larger equipment with less maintenance but is not ideal for phasing and flexibility.

### Decentralized

A decentralized system houses all heating and cooling equipment in individual buildings. All buildings are independent of a central loop and mechanical equipment is standalone. In essence, the existing central heating/cooling loop would be abandoned. While this reduces overall pumping energy, it also significantly increases maintenance costs. It is also difficult from a constructability perspective since existing buildings don't typically have extra space or electrical capacity for large new equipment. This approach is also challenging to integrate with geothermal as it is impractical for each building to have its own wells.

### Nodal

A nodal system houses all heating and cooling equipment in several smaller distributed plant buildings, meaning new plant buildings would be built across campus. This approach is a blend of centralized and decentralized, and each plant building would house mid-size mechanical equipment.

## Decarbonization Solution | Plant Configuration Scoring

The plant configuration analysis compared three options for the distribution of central plant equipment and distribution of thermal energy across the campus. These options were scored against performance criteria identified in collaboration with EWU stakeholders, and the results are shown in Table 5.

Table 5: Relative Scoring for Plant Distribution Strategies

| Centralized   | Decentralized  | Nodal  |
|---|--|--|
| <b>Recommendation</b>   |  |  |
| <b>The nodal configuration is recommended as it has many of the benefits of the centralized system while being flexible and well-suited to phasing.</b>   |  |  |
| <b>Description</b>  |  |  |
| This option is most similar to the existing central plant configuration, with all major mechanical equipment located in one central location.   | This option would employ major pieces of mechanical equipment (i.e. water-to-water heat pumps, air-source heat pumps) at each building to produce heating and cooling at the building level.   | This option would utilize multiple "nodal" plants, each with major mechanical equipment, spread across campus.   |
| <b>First Cost</b>   |  |  |
| \$\$  | \$\$\$\$   | \$\$\$   |
| <b>Utility Cost</b>   |  |  |
| \$  | \$\$   | \$   |
| <b>Maintenance Cost</b>   |  |  |
| \$  | \$\$\$\$   | \$\$   |
| <b>Carbon Cost Effectiveness</b>  |  |  |
| High  | Medium   | High   |
| <b>Teaching / Curriculum Opportunity</b>  |  |  |
| Medium  | Low  | High   |
| <b>Overall Score</b>  |  |  |
| <b>4.10</b>   | <b>2.00</b>  | <b>4.20</b>  |
| <b>Advantages</b>   |  |  |
| <ul style="list-style-type: none"> <li>- Fewer pieces of major mechanical equipment mean less maintenance</li> <li>- Fewer wells</li> <li>- Reduced well maintenance</li> <li>- Reduced infrastructure costs</li> <li>- Doesn't require new buildings across campus</li> </ul>  | <ul style="list-style-type: none"> <li>- Doesn't require new or modified distribution piping</li> <li>- Buildings can be built and operated independently of each other</li> <li>- No new dedicated building for plant equipment needed</li> </ul>   | <ul style="list-style-type: none"> <li>- Better for phasing than central plant</li> <li>- Flexible to evolving campus plans</li> <li>- Lower conveyance piping costs for geothermal</li> <li>- Lower likelihood of overdesigning wellfields</li> <li>- Provides opportunity to showcase decarbonization</li> </ul> |
| <b>Disadvantages</b>  |  |  |
| <ul style="list-style-type: none"> <li>- Higher conveyance piping costs for geothermal</li> <li>- Fewer pieces of equipment mean less redundancy/resiliency</li> <li>- Harder to phase, resulting in larger capital requests</li> <li>- New hot water distribution piping across campus has high campus impact</li> </ul> | <ul style="list-style-type: none"> <li>- Higher O&amp;M costs from increased quantity of equipment</li> <li>- Reduced Space/roof area in buildings to fit mechanical equipment</li> <li>- Most likely requires substantial electrical upgrades at most buildings</li> <li>- Abandons existing infrastructure</li> <li>- No heat sharing</li> </ul> | <ul style="list-style-type: none"> <li>- More maintenance than central system</li> <li>- Requires small new plant buildings and new hot water distribution piping</li> </ul>   |

## Section 4

# Decarbonization Solution – Building Conversions

### Key Takeaways

- The nine buildings were scoped for decarbonized space heating and water heating based on their existing systems.
- No electrical service upgrades are required at any of the nine buildings.
- The total ROM cost to convert these nine buildings so they can connect to the first geothermal node is ~\$20,000,000.

**Building Renovations**

Achieving decarbonization at EWU hinges on ensuring that the existing buildings can utilize thermal energy from the proposed nodal geothermal plants. Sharing thermal energy is the defining feature of any district energy system. This study has scoped decarbonization renovations to connect nine buildings to the first nodal plant. The district connection is intended to allow the sharing of thermal energy for both space heating and domestic water heating systems. The proposed renovations also dovetail with a variety of efficiency improvements that are outlined in the Energy Upgrades ROM Pricing Report and included in the 2025-2027 capital request. Improving the functionality, efficiency, and control of any system will improve the overall performance of the district. The exact implementation of building renovations is dependent on the funding received. Figure 8 below shows the nine buildings considered for connection to the first nodal central plant. The specific renovations required are discussed in the following pages.

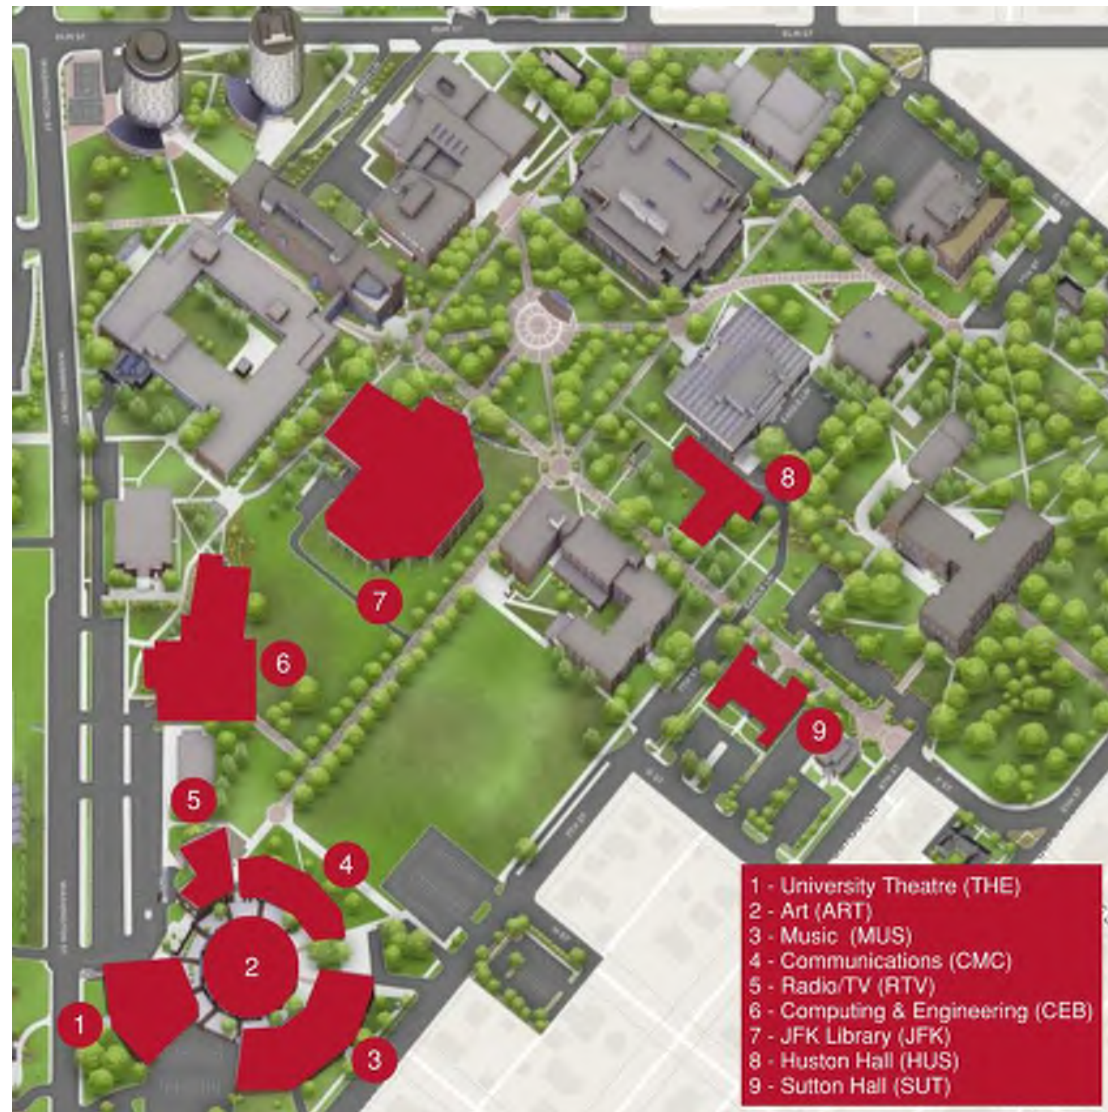

Figure 8: Buildings Studied for District Interconnection

**Mechanical Decarbonization Strategies**

Table 6 and Table 7 below describe the recommended strategies for decarbonizing the space heating and DHW systems. The proposed in-building solutions assume low temperature hot water (LTHW) is provided to the buildings at approximately 120°F. The appendices include detailed descriptions of the existing systems in each building.

Table 6: Space Heating Decarbonization Strategies

| Decarbonization Strategy   | Existing Mechanical System   | Proposed Mechanical System   | Applies To  |
|--|--|--|---|
| HHW Strategy 1<br><b>High Temp Hot Water (HTHW) Double Lift</b>      | Many heating coils served by HTHW.                                       | Add in-building water-to-water heat pump to boost district energy LTHW supply up to 180°F to serve existing coils. No coil replacement.                                | JFK - Kennedy Library<br>SUT - Sutton Hall  |
| HHW Strategy 2<br><b>Coil Replacement</b>                            | Relatively few heating coils. All coils are either direct steam OR HTHW. | Replace coils and piping with LTHW. Replace existing fans with new fan walls.  | CEB - Computer & Engineering<br>CMC - Communications<br>HUS - Huston Hall<br>MUS - Music Building<br>RTV - Radio & TV |
| HHW Strategy 3 -<br><b>Hybrid Coil Replacement &amp; Double Lift</b> | Direct steam heating coils AND HTHW coils.                               | Replace steam coils with LTHW piping and coils. Add in-building water-to-water heat pump to boost district energy LTHW supply up to 180°F to serve existing HTHW coils | ART - Art Building<br>THE - Theater   |

Table 7: Domestic Hot Water Decarbonization Strategies

| Decarbonization Strategy                              | Strategy Description  | Applies To   |
|---|---|--|
| DHW Strategy 1<br><b>Existing Electric DHW Heater</b> | Maintain existing electric DHW heater(s), tanks(s) and infrastructure.  | CMC - Communications<br>MUS - Music Building<br>RTV - Radio & TV<br>SUT - Sutton Hall<br>THE - Theater |
| DHW Strategy 2<br><b>DHW Double Lift Heat Pump</b>    | Add an in-building DHW heat pump and storage tank to use district energy LTHW and maintain DHW @ 140°F. Existing steam converter to be left in place for optional backup. | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>ART - Art Building       |

**Building Decarbonization Strategy 1**

**Mechanical**

Strategy 1 will add an in-building water-to-water heat pump to boost district energy LTHW and supply up to 180°F to serve the existing coils. All existing coils will remain, which will limit the scope of work to the main mechanical room near the existing steam converter. The existing steam converter will be left in place for backup to allow for sizing the booster WWHP for 60-80% of the true building peak load, saving cost, while still delivering ~90-95% of annual building heat. The hot water reset schedule should be optimized to maintain the lowest temperature HW necessary to provide heat to the building.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 1 is applicable for buildings without steam, where there exists a large quantity of hot water coils requiring High Temperature Hot Water. The Kennedy Library (JFK) is shown in Figure 9, but this strategy can also be applied to Sutton Hall (SUT) which has similar systems.

**Additional Considerations**

Further study of the actual building loads will impact how this strategy is implemented. The continued use of steam provides flexibility and resiliency while decarbonized systems are implemented and commissioned. In some cases, it may be possible to decommission the steam system once the decarbonized system is operational and demonstrates the ability to meet the building loads. Depending on the timeline for implementation, new technologies in high-temperature heat pumps may reduce cost and

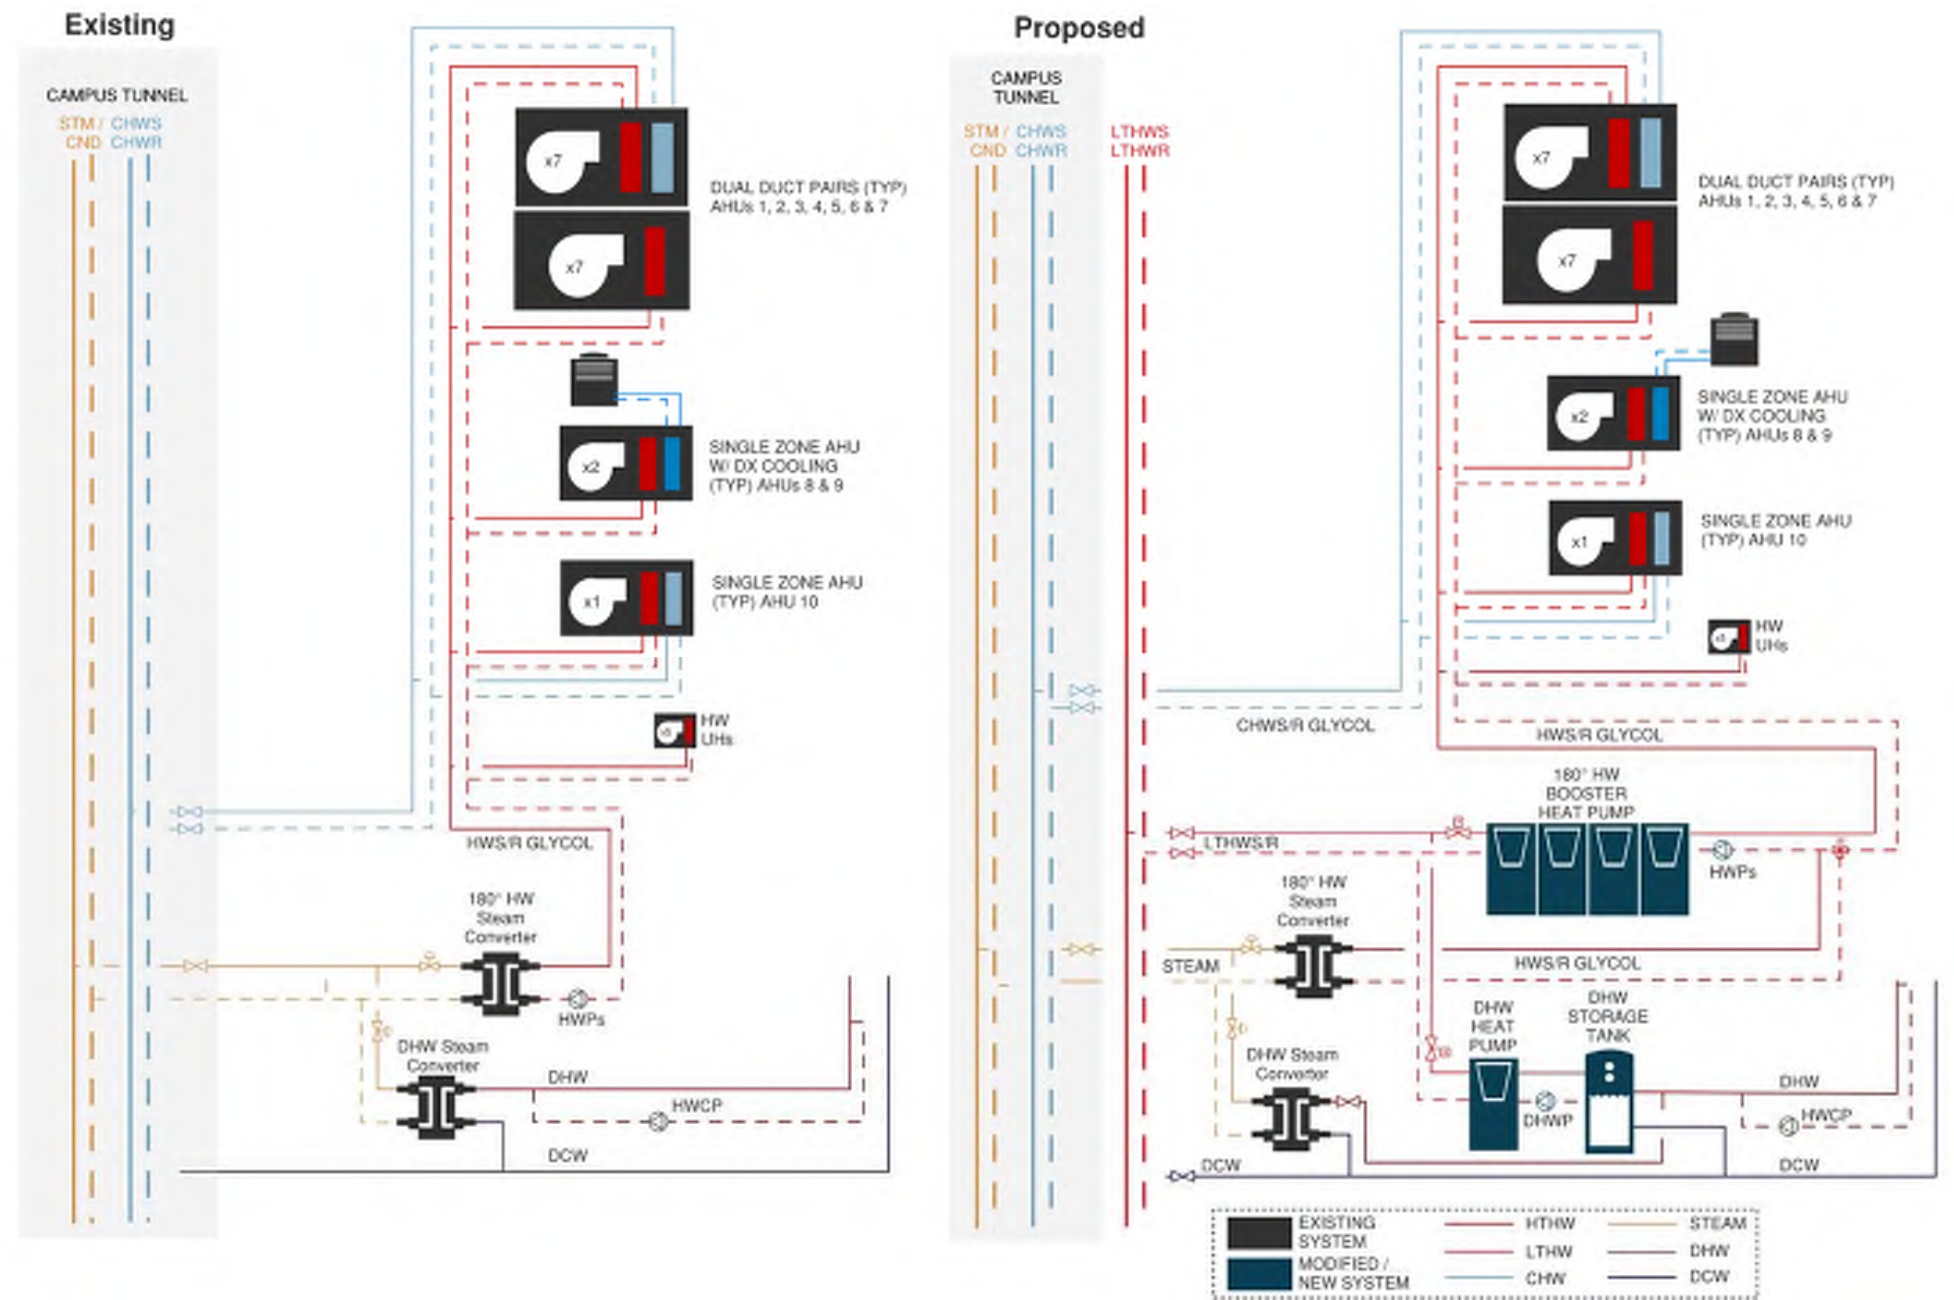

Figure 9: Strategy 1 Mechanical Diagrams

**Building Decarbonization Strategy 2**

**Mechanical**

Strategy 2 will replace all steam coils and piping with low temperature hot water (LTHW) coils and piping to utilize district energy LTHW. A new heat exchanger will be necessary to isolate building LTHW loop from district LTHW loop and allow for glycol freeze protection in the building loop. To allow both space and capacity for new LTHW coils, the fans will need to be replaced with new fan walls.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters utilizes for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 2 applies to buildings that have steam heating and limited or no terminal systems with coils. These systems are ideally suited to change out steam coils and piping and serve with district energy LTHW. The Computer & Engineering Building (CEB) is shown in the diagram below, but this strategy can also be applied to Communications (CMC), Huston Hall (HUS), Music (MUS) and the Radio & TV Building (RTV), which have similar systems.

Figure 10: Strategy 2 Mechanical Diagrams

**Building Decarbonization Strategy 3**

**Mechanical**

Strategy 3 will replace large steam coils in air handlers with low temperature hot water (LTHW) coils to utilize district energy LTHW. To allow both space and capacity for new LTHW coils, the air handler fans will need to be replaced with new fan walls. A new heat exchanger will be necessary to isolate the building LTHW loop from the district LTHW loop and allow for glycol freeze protection in the building loop.

Terminal heating systems will be served by a new in-building water-to-water heat pump to boost district energy LTHW up to 180°F HW. The hot water reset schedule should be optimized to maintain the lowest temperature HW necessary to provide heat to the building. The existing steam converter to be left in place as back up to allow for sizing the booster WWHP for 60-80% of the true building peak load, saving cost, while still delivering ~90-95% of annual building heat.

**Domestic Hot Water**

If the building currently utilizes electric boilers or electric tank style heaters utilizes for domestic hot water, they are to remain in place. If campus steam is used to heat domestic hot water, a new in-building DHW heat pump and storage tank will be added to use district energy LTHW and maintain DHW @ 140°F. The existing steam converter to be left in place for optional backup and can be removed if and when campus steam becomes obsolete.

**Application**

Strategy 3 applies to buildings that have steam heating and hot water terminal heating. These systems are ideally suited to change out steam coils and serve directly with district energy LTHW but will also require an in-building heat pump to maintain the terminal heating hot water loop temperature up to 180°F. The Art Building (ART) is shown in the diagram below, but this strategy can also be applied to the Theater Building (THE), which has similar systems.

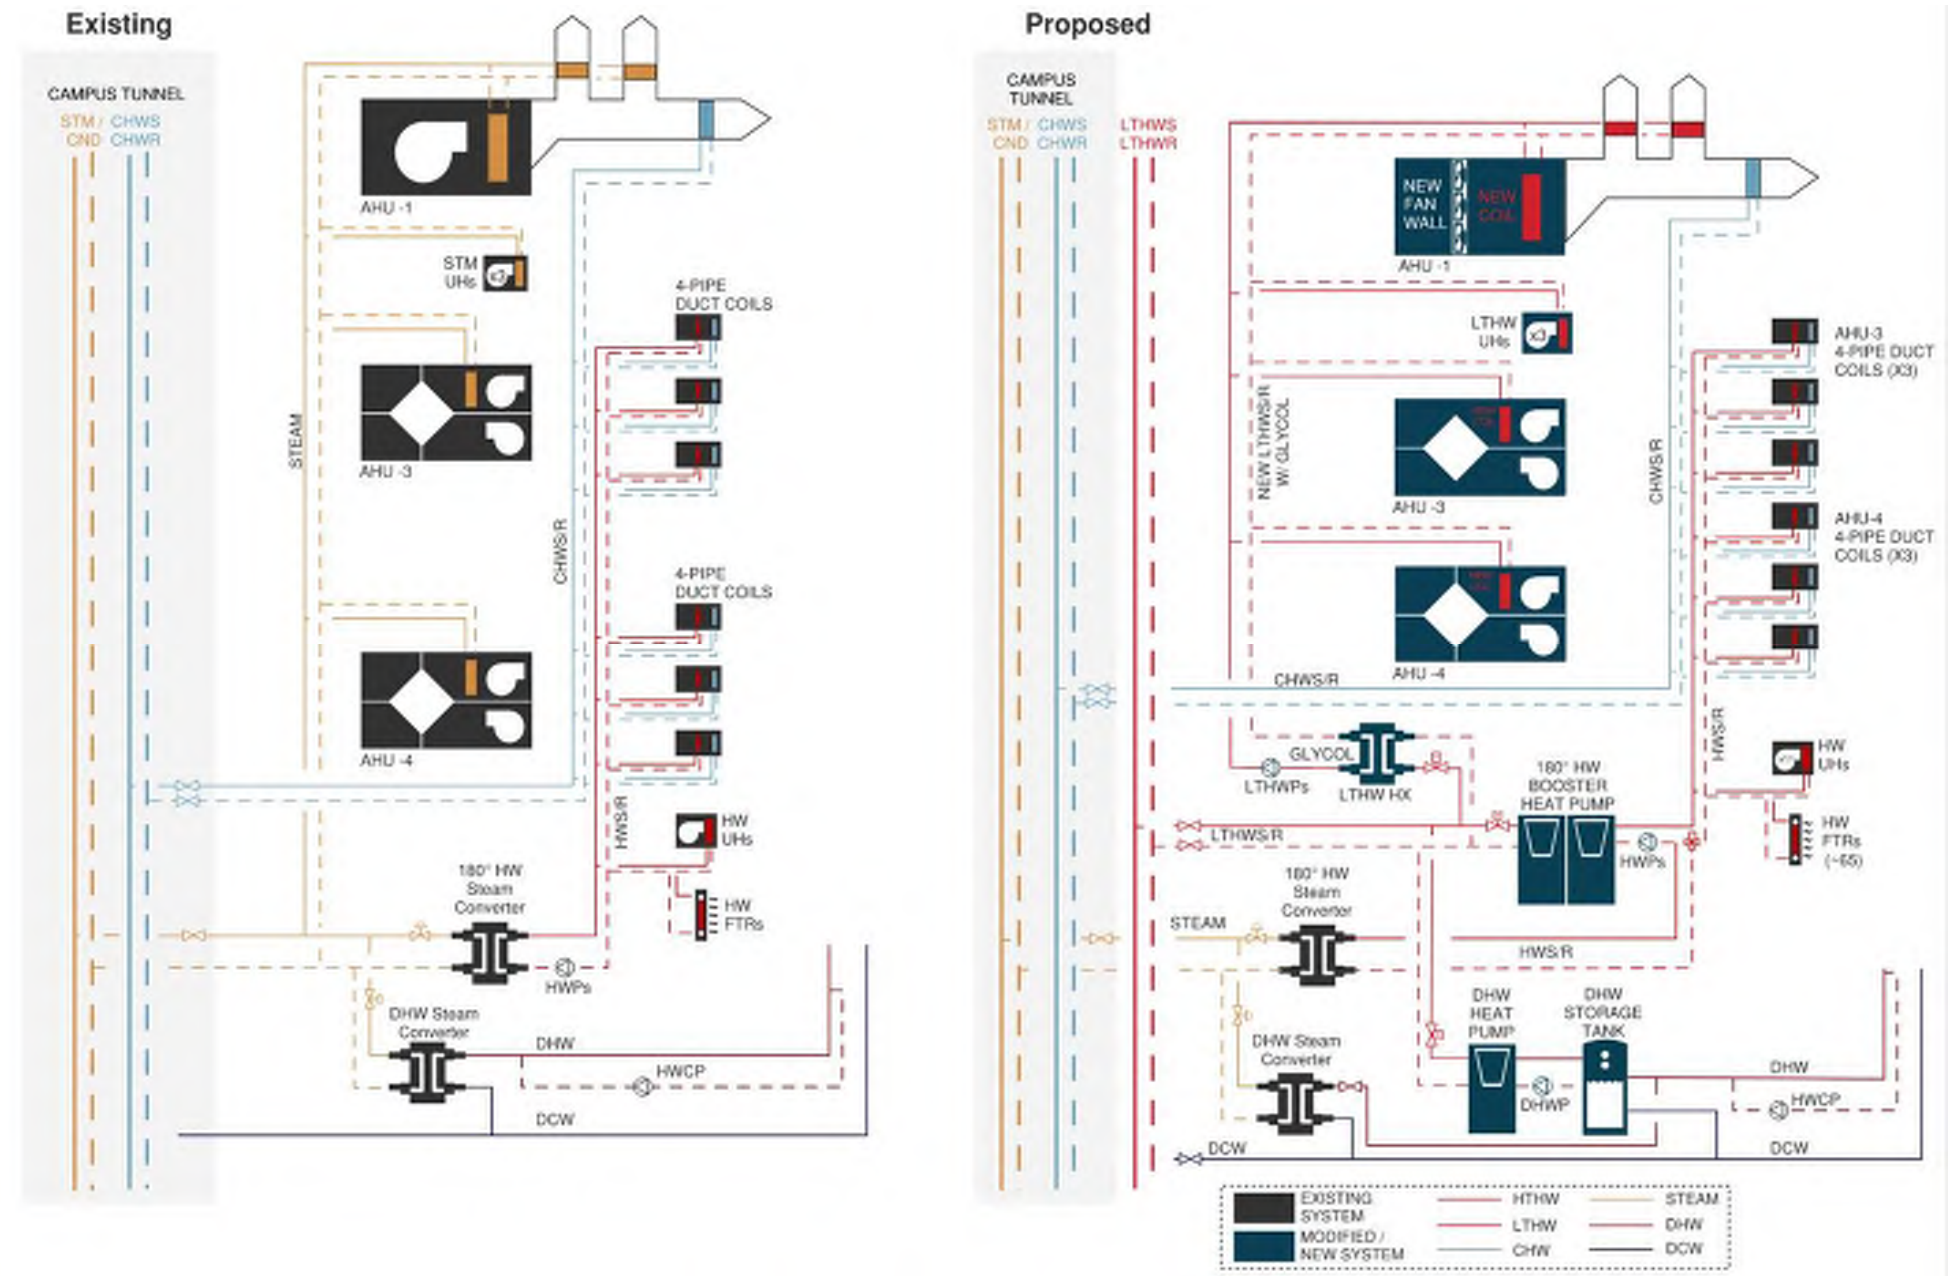

Figure 11: Strategy 3 Mechanical Diagrams

Summary of In-Building Infrastructure

The available electrical capacity and the increased load required to accommodate the proposed upgrades was reviewed at all nine buildings on campus. Metering data was reviewed at each of the buildings, where available, and compared to the capacity as determined from the building service nameplate ratings. **All the buildings reviewed were found to have sufficient electrical capacity available and can accommodate the proposed mechanical revisions without requiring a new electrical service.**

Figure 12: Summary of Existing Electrical Capacity Analysis

## Decarbonization Solution | Building Electrical Systems

### Summary of Energy Efficiency Measures

The energy efficiency measures below are recommended for implementation. While these measures can occur independently of the decarbonization conversions, they should happen concurrently to capture complementary benefits.

Table 9: Energy Efficiency Measures by Building

| Energy Efficiency Measure                         | Strategy Description   | Applies to   |
|---|--|--|
| Lighting Upgrade                                  | Savings is a result of decreased power draw of LED lamps versus fluorescent lamps  | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>SUT - Sutton Hall<br>ART - Art Building<br>MUS - Music Building<br>THE - Theater Building<br>RTV - Radio & TV<br>CMC - Communications Building |
| Lighting Controls                                 | Room- or luminaire-based occupancy sensors will reduce lighting runtime. Recommend installing in study rooms, conference rooms, restrooms, etc..                                   | JFK - Kennedy Library<br>CEB - Computer & Engineering<br>HUS - Huston Hall<br>SUT - Sutton Hall<br>ART - Art Building<br>MUS - Music Building<br>THE - Theater Building<br>RTV - Radio & TV<br>CMC - Communications Building |
| Window Upgrade                                    | Energy savings is a result of reduced heat loss through energy efficient windows   | ART - Art Building<br>MUS - Music Building   |
| Demand Control Ventilation (DCV)                  | DCV automatically reduce ventilation intensity during off-peak hours, saving energy. Consists of sensors and controllers that adjust ventilation based on indoor air quality (CO2) | JFK - Kennedy Library<br>MUS - Music Building  |
| Damaged Duct / Coil Connections                   | Savings will be a result of decreased heat loss from AHU at damaged ductwork as well as water savings from leaking coil(s).  | THE - Theater Building<br>CMC - Communications Building  |
| Constant Volume to Variable Volume Fans and Pumps | Savings result from ability to throttle pumps, fans, and valves when viable.<br>Increased ability for zone control and scheduling.   | ART - Art Building   |
| Air System Testing and Balancing                  | Process of measuring, adjusting, and verifying HVAC systems to ensure they are functioning effectively and efficiently.  | CEB - Computer & Engineering   |
| Unoccupied Turndown Schedule                      | Unoccupied turndowns will result in reduced heating/cooling load as well as reduced fan energy.  | JFK - Kennedy Library<br>HUS - Huston Hall<br>SUT - Sutton Hall<br>ART - Art Building<br>MUS - Music Building<br>RTV - Radio & TV  |

## Decarbonization Solution | Building Conversion Summary and ROM Costs

### Summary of In-Building Renovations

The costs listed below are “all in” costs, reflective of the total cost EWU can expect when implementing these projects. They include the building conversion strategies listed below as well as the energy efficiency measures listed in Table 9. They are ROM costs for budgetary purposes and will need to be refined during the next stage of development/implementation. The appendix provides additional cost information.

Table 10: Building Conversion Summary and ROM Costs.

|     | Building                         | Building Area [s.f.] | Existing System   | Decarbonized System  | Decarbonized System Cost |
|-----|----------------------------------|----------------------|---|--|--------------------------|

|                         | AHU-7 H   |   |                  |                 |   |                 |                       |  |  |
|                         | AHU-8   |   |                  |                 |   |                 |                       |  |  |
|                         | AHU-9   |   |                  |                 |   |                 |                       |  |  |
|                         | AHU-10  |   |                  |                 |   |                 |                       |  |  |
| UHs                     |   |   |                  |                 |   |                 |                       |  |  |
| DHW                     | Electric tank type heater are to remain. Add a new WSHP DHW heater to offset the DHW capacity from the steam converter. The steam converter should be left in place as back up. | New supply and return piping from campus LTHW to new DHW Heat Pump.<br>New DHW piping to integrate storage tank.            |                  |                 |   |                 |                       | 337.2 kW new total load for (4x)SBH300 Modular WSHP<br>(2) New 10 HP Pumps |  |
|                         |   |   |                  |                 | Provide new Transom SWH200 WSHPs using the proposed campus LTHW to provide DHW to facility. Provide 100 gallon storage tank. Provide new 20 GPM B&G EcoCirc Pump. Tie into existing DHW system. Existing to remain in place as back up. |                 |                       | 33.7 kW power for new Transom SWH150 WSHP. New 1/2 HP Circ Pump            |  |

## Appendix C | Renovation Scope by Building

| Building                        | Summary of Retrofit | Pipe Replacement   | Coil Replacement   | Fan Replacement  | Booster Heat pump  | Steam Converter | HX & Hydronic Pump(s)   | Electrical Impacts   |   |
|---------------------------------|---------------------|--|--|--|--|-----------------|---|--|---|
| Computer & Engineering Building | AHU-1 C             |  | Retrofit new 1100 MBH LTHW coil into existing AHU cabinet and provide new control valve.   | Retrofit new 49000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |  |                 |   |  |   |
|                                 | AHU-1 H             |  | Retrofit new 600 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 14000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |  |                 |   |  |   |
|                                 | AHU-2 C             | Replace (7) existing AHU steam coils with new LTHW coils.<br>Provide (7) new fan wall sections for AHUs.                               | Route approximately 1500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 5" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 1000 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                   | Retrofit new 51000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   | Install new plate & frame HX between campus LTHW and new building LTHW loops.  |   |
|                                 | AHU-2 H             | Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs.  |  | Retrofit new 1200 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                   | Retrofit new 20000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             | Provide new 3000MBH shell & tube steam to HW converter, pipe in sidecar configuration to building primary variable LTHW loop.   | Install (2)x400gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. Pipe in parallel and tie into new construction hydronic piping loop. Provide typical pump appurtenances (shutoff valves, strainers, P/T ports, etc.) | (2) New 10 HP Building HW Pumps<br><br>(7) New Fan Wall arrays, expected to remain with existing electrical capacity. |
|                                 | AHU-3               | Retain steam connection at building, provide new steam-HW converter and pipe into new hydronic piping.                                 |  | Retrofit new 500 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 20000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | AHU-4               |  |  | Retrofit new 300 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 10000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | AHU-5               |  |  | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 15000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                 |   |  |   |
|                                 | DHW                 | Add a new WSHP DHW heater to offset the DHW capacity from the steam converter. The steam converter should be left in place as back up. |  | New supply and return piping from campus LTHW to new DHW Heat Pump.<br>New DHW piping to integrate storage tank.           |  |                 | Provide (2) new Transom SWH250 WSHPs using the proposed campus LTHW to provide DHW to facility. Provide 100 gallon storage tank. Provide new 20 GPM B&G EcoCirc Pump. Tie into existing DHW system. Existing steam converter to remain in place as back up. |  |   |

## Appendix C | Renovation Scope by Building

| Building       | Summary of Retrofit | Pipe Replacement   | Coil Replacement   | Fan Replacement  | Booster Heat pump | Steam Converter   | HX & Hydronic Pump(s)  | Electrical Impacts   |
|----------------|---------------------|--|--|--|-------------------|---|--|--|
| Music Building | AH-1                | Route approximately 1000ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 4" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 1600 MBH LTHW coil into existing AHU cabinet and provide new control valve. | Retrofit new 40000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A               | Provide new 2000MBH shell & tube steam to HW converter, pipe in sidecar configuration to building primary variable LTHW loop. | Install new plate & frame HX between campus LTHW and new building LTHW loops.<br><br>Install (2)x220 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. Pipe in parallel and tie into new construction hydronic piping loop. Provide typical pump appurtenances (shutoff valves, strainers, P/T ports, etc.) | (2) New 7.5 HP Building HW Pumps<br><br>(2) New Fan Wall arrays, expected to remain with existing electrical capacity. |
|                | AH-2                |  | Retrofit new 600 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 18000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories |                   |   |  |  |
|                | UHs                 |  | Replace existing UH with new LTHW UH. Provide new control valve.                         | Provide new LTHW UH.   |                   |   |  |  |
|                | DHW                 | Existing electric DHW to remain in place.  |  |  |                   |   |  | N/A  |

## Appendix C | Renovation Scope by Building

| Building           | Summary of Retrofit | Pipe Replacement   | Coil Replacement  | Fan Replacement  | Booster Heat pump                 | Steam Converter   | HX & Hydronic Pump(s)  | Electrical Impacts   |
|--------------------|---------------------|--|---|--|-----------------------------------|---|--|--|
| University Theater | AHU-1               |  | Retrofit new 1100 MBH LTHW coil into existing AHU cabinet and provide new control valve.  | Retrofit new 21000 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A                               |   | Install new plate & frame HX between campus LTHW and new building LTHW loops. Install (2) x 5 HP 60 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances.   | (2) New 5 HP Building HW Pumps<br><br>(1) New Fan Wall arrays, expected to remain within existing electrical capacity. |
|                    | AHU-2               | 1) Replace existing AHU steam coils with new LTHW coils. Provide new fan wall sections for all AHUs. Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs. | Route approximately 1000ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 4" at the pump header to 2" at the coil connection. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc) and fill with 30% glycol solution. | N/A<br>Cooling Only  |                                   |   |  |  |
|                    | Steam Converter     | 2) Deploy a high temperature booster heat pump using the proposed campus LTHW as a source, and creating HTHW for the existing terminal HW loop.  | New piping for LTHW loop to existing terminal HWR for back up heating to AHU coils.   | N/A  | N/A                               | Provide a (2) SBH100 30 ton modular water to water heat pump located in the existing mechanical room. The combined total is 750 MBH which will provide for the system load the majority of the year. Connect in sidecar configuration to existing building piping loop. Provide new controls for WWHP and accessories, tie into existing building BAS. Assume (20) physical points & (40) virtual points. | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | 53 kW new (2x)SBH100 Modular WSHWP<br>(2) 3 HP B&G EcoCirc 375XL or similar.   |
|                    | Reheat Terminals    | The existing steam converter and pump infrastructure shall remain in place as backup. HW & CHW piping infrastructure and coils will remain unchanged.  |   |  |                                   |   | Provide new duplex ECM circulator pump array serving the WWHP, B&G EcoCirc 375XL or similar.<br><br>Pipe in parallel and tie into existing hydronic piping loop.   |  |
|                    | Radiators           |  |   | All terminal device coils remain.  | All terminal device coils remain. |   |  |  |
|                    | CUHs                |  |   |  |                                   |   |  |  |
|                    | UHs                 | Replace steam UH with LTHW   | Route 100ft of new copper HW piping to branch to new UHs in Mechanical spaces. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.)  | Replace existing UH with new LTHW UH. Provide new control valve.   | Provide new LTHW UH.              | N/A   |  | (3) New UHs expected to remain within existing electrical capacity.  |
|                    | DHW                 | Existing electric DHW to remain in place.  |   |  |                                   |   |  |  |

## Appendix C | Renovation Scope by Building

| Building     | Summary of Retrofit | Pipe Replacement  | Coil Replacement   | Fan Replacement  | Booster Heat pump   | Steam Converter | HX & Hydronic Pump(s)  | Electrical Impacts  |  |
|--------------|---------------------|---|--|--|---|-----------------|--|---|--|
| Art Building | AHU-1               | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2.5" & 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution.                                     | Retrofit new 1800 MBH LTHW coil into existing AHU cabinet and provide new control valve.   | Retrofit new 36085 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A   |                 |  |   |  |
|              | AHU 1 - Duct Coil 7 |   | Retrofit new 400 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 1 - Duct Coil 8 |   | Retrofit new 700 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU-3               | 1) Replace existing AHU steam coils with new LTHW coils. AHU-1 Preheat, AHU 1 Duct Coils 7 & 8, AHU 3 & 4 Preheat Coils. Provide new fan wall sections for AHUs 1, 3 & 4.<br><b>(New AHU preheat coils are downsized to reflect realistic loads that account for heat recovery &amp; 4°F OSA design temp. )</b> | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 8950 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | Install new plate & frame HX between campus LTHW and new building LTHW loops.<br><br>Install (2) x 20 HP 450 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. | (2) New 20 HP Building HW Pumps<br><br>(3) New Fan Walls expected to remain within existing electrical capacity. |
|              | AHU 3 - Duct Coil 1 | N/A maintain HWS/R piping.  | Retrofit new 200 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 3 - Duct Coil 2 |   | Retrofit new 100 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU 3 - Duct Coil 3 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU-4               | 2) Replace (6) 180°F duct coils with 120°F duct coils served by LTHW.<br><br>Provide new hydronic heat exchanger, new hydronic pumps, new piping to all existing AHUs.  | Route approximately 500ft of new cast iron & copper HW piping to each AHU, with sizes ranging from 3" at the pump header to 2" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Retrofit new 400 MBH LTHW coil into existing AHU cabinet and provide new control valve.                                    | Retrofit new 8550 cfm fan wall array into existing AHU cabinet, including new flow sensors, VFDs, and control accessories | N/A             |  |   |  |
|              | AHU 4 - Duct Coil 4 | N/A maintain HWS/R piping.  | Retrofit new 200 MBH LTHW coil into existing duct.   | N/A - No Fan   |   |                 |  |   |  |
|              | AHU 4 - Duct Coil 5 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |
|              | AHU 4 - Duct Coil 6 |   | Retrofit new 200 MBH LTHW coil into existing duct.   |  |   |                 |  |   |  |

## Appendix C | Renovation Scope by Building

| Building                 | Summary of Retrofit  | Pipe Replacement  | Coil Replacement  | Fan Replacement  | Booster Heat pump    | Steam Converter  | HX & Hydronic Pump(s)  | Electrical Impacts  |  |
|--------------------------|--|---|---|--|----------------------|--|--|---|--|
| Art Building (continued) | Steam UHs  | Replace (3) steam UHs with new LTHW UHs.  | Route approximately 100ft of new copper HW piping to each UH, with sizes ranging from 1 1/2" 1" at the coil connections. Provide all new coil appurtenances (shutoffs, P/T ports, strainers, etc.) and fill with 30% glycol solution. | Replace existing UH with new LTHW UH. Provide new control valve. | Provide new LTHW UH. | N/A  | The existing steam converter will be left in place as a supplemental and backup source. Existing convertor, associated pumps and accessories to remain. Reconfigure piping to tie into the building HWS/R loop downstream of the proposed new WWHP in a sidecar configuration. | Install new plate & frame HX between campus LTHW and new building LTHW loops.<br><br>Install (2) x 20 HP 450 gpm end suction pumps with VFDs, fully grouted isolation bases, suction diffusers and other appurtenances. | (3) New UH's expected to remain within existing electrical capacity. |
|                          | Perimeter Steam to HW Converter  | Deploy a high temperature booster heat pump using the proposed campus LTHW as a source, and creating HTHW for the existing perimeter HW loop. The existing steam converter and pump infrastructure shall remain in place as backup. HW & CHW piping infrastructure and coils will remain unchanged. | N/A maintain HWS/R piping.  | N/A  | N/A                  | Provide a (2) SBH200 60 ton modular water to water heat pump located in the existing mechanical room. The combined total is 1450 MBH which will provide for the system load the majority of the year. Connect in sidecar configuration to existing building piping loop. Provide new controls for WWHP and accessories, tie into existing building BAS. Assume (20) physical points & (40) virtual points. | Provide new duplex ECM circulator pump array serving the WWHP, B&G EcoCirc 375XL or similar.<br><br>Provide dedicated magnetic filter on header.<br>Provide typical pump appurtenances (shutoff valves, strainers, P/T ports, etc.)  | 112 kW new (2x)SBH200 Modular WSHP<br>(2) 3 HP B&G EcoCirc 375XL or similar.  |  |
|                          | HW Convectors  |   |   |  |                      |  |  |   |  |
|                          | HW UHs   |   |   |  |                      |  |  |   |  |
|                          | HW Wall Fin  |   |   |  |                      |  |  |   |  |
| DHW                      | Add a new WSHP DHW heater to offset the DHW capacity from the steam converter. The steam converter should be left in place as back up. | New supply and return piping from campus LTHW to new DHW Heat Pump.<br>New DHW piping to integrate storage tank.  |   |  |                      | Provide new Transom SWH150 WSHPs using the proposed campus LTHW to provide DHW to facility. Provide 100 gallon storage tank. Provide new 20 GPM B&G EcoCirc Pump. Tie into existing DHW system. Existing to remain in place as back up.  |  | 25.8 kW power for new Transom SWH150 WSHP. New 1/2 HP Circ Pump   |  |

## Appendix C | Renovation Scope by Building

| Building    | Summary of Retrofit                                    | Pipe Replacement  | Coil Replacement   | Fan Replacement  | Booster Heat pump   | Steam Converter  | HX & Hydronic Pump(s)  | Electrical Impacts  |   |

## 0.1 PROBLEM STATEMENT

**EWU's high-tech, hands-on engineering pedagogy has evolved beyond its existing substandard teaching laboratory facilities, originally designed to develop high school shop teachers. This lack of suitable space for contemporary engineering education also restricts EWU from offering a Civil Engineering program which would address the critical shortage of civil engineers across Washington State and leverage EWU's existing complementary strengths in geosciences and construction management.**

EWU's Department of Mechanical Engineering & Technology (MENT) offers rigorous and pragmatic Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Applied Technology, and Construction Management degrees that prioritize hands-on training and applied learning that lead to high-paying, non-gig jobs. EWU's engineering classes are taught by faculty with industry experience. The department is housed in the 30-year-old Computing and Education Building (CEB).

MENT graduates are highly sought after in the growing Spokane and West Plains mechanical engineering marketplace—in the most recent survey, 86% of MENT graduates were employed in a job related to their degree within a year of graduation. Regional civil engineering firms often hire students from both MENT and EWU's Geosciences department due to the state-wide lack of qualified graduates in civil engineering. Given EWU's existing strengths in MENT and geosciences and the strong demand for civil engineers, EWU would like to expand its hands-on, career-oriented engineering degrees to include Civil Engineering (CE).

The high-tech, hands-on laboratory training which makes up a significant portion of MENT education currently takes place in substandard spaces with serious deficiencies consistently documented in accreditation visits. These include student safety concerns due to poor instructor sightlines, reduced overhead clearances and limited overhead services which restrict evolution with changing machine technology, aging technological infrastructure, ADA accessibility concerns, and lack of student interaction spaces. Lack of suitable space also restricts both the hiring of additional MENT faculty and the development of a CE program. Finally, the existing inadequate space has severely limited engineering research and on-campus industry collaboration.

## 0.2 PROPOSED SOLUTION

**A new Engineering Building connected to the existing Computing and Engineering Building (CEB) is the best alternative to providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing Mechanical Engineering and Technology and prospective Civil Engineering programs.**

The 82,522 GSF building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas. 42,411 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The construction of the Engineering Building will allow MENT program growth and degree production and allow EWU to offer a CE degree program, with conservative forecasting showing enrollment increasing 76% in the first five years of building occupancy.

Enabling engineering enrollment growth at EWU will not only change students' lifelong potential but lead Washington State in solving some of the 21st century's biggest challenges.

### 0.3 PROJECT CONTEXT

#### State and Regional Context

Engineering is one of the top three STEM occupations in Washington State and the Northeast Washington region. State reports indicate a 65% gap in supply of engineering bachelor's degrees needed to meet workforce demand in Washington State in the next five years. All bachelors degrees and certificate programs offered by EWU's Engineering Department are designated STEM/High Demand by the State of Washington and prepare students for entry into cutting-edge engineering and related professions.

#### Institutional Context

EWU's mission is to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence.

EWU is in the implementation phase of a Strategic Resource Allocation project to better understand which programs (both academic and administrative) are thriving, which require additional support, and which should be eliminated or re-envisioned. From this analysis, engineering emerged as an area for further investment. EWU is also developing a strategic plan and examining its institutional branding and identity. An emerging theme of both efforts is a stronger institutional commitment to emphasize applied learning through serving the needs of the region.

The proposed Engineering Building will support EWU's mission by providing facilities which will encourage enrollment in high-demand degree programs, create spaces that foster inclusive practices, support community and prospective student outreach activities with rural and underserved populations, improve the quality and safety of laboratories, be a living laboratory for sustainability, fully inspire and support students' unique interests through degree completion, and encourage student engagement with each other, the engineering programs and the regional engineering industry.

#### Enrollment Growth

From 2010 through 2020, EWU's Mechanical Engineering and Technology program experienced strong and sustained enrollment growth. Rebuilding post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. The Engineering Department has built highly successful outreach programs to rural and underserved prospective student populations and continuation programs with community colleges, which have created a strong pipeline for future MENT & CE students. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 76% in the first four years of building occupancy.

## 0.4 SPACE NEEDS ASSESSMENT

The program requirements for the Engineering Building and renovation of CEB were developed with campus and engineering faculty and summarized below:

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |
| Offices & Office Support                         | 1,740         |
| Collaboration                                    | 7,180         |
| Total Engineering Building (ASF)                 | 45,387        |
| Estimated Net/Gross Ratio                        | 55%           |
| <b>Estimated Engineering Building Area (GSF)</b> | <b>82,522</b> |
| <b>CEB Renovated Spaces</b>                      |               |
| Teaching Labs                                    | 14,406        |
| Research Labs                                    | 2,863         |
| Classrooms                                       | 1,296         |
| Offices & Office Support                         | 8,809         |
| Collaboration                                    | 4,051         |
| Total CEB Renovated Space (ASF)                  | 31,425        |
| Estimated Net/Gross Ratio                        | 80%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>39,281</b> |
| <b>Cheney Hall Renovated Spaces</b>              |               |
| Teaching Labs                                    | 981           |
| Research Labs                                    | 1,836         |
| Total CEB Renovated Space (ASF)                  | 2,817         |
| Estimated Net/Gross Ratio                        | 90%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>3,130</b>  |

Ratio consistent with other science buildings

EWU aspires to at minimum achieve the mandatory LEED® Silver certification; higher certification levels and other methods to reduce greenhouse gas emissions will be explored in future phases.

## 0.5 ANALYSIS OF ALTERNATIVES

Three alternatives were considered for addressing the identified needs:

- No action
- Full renovation of the existing CEB and Cheney Hall facilities
- A new building on the existing campus connected to CEB

No action would maintain substandard, pedagogically inappropriate facilities and makes it impossible for EWU to offer new, high-demand STEM degree programs such as civil engineering. A full renovation of the existing CEB is not prudent given that most spaces are good condition for their intended use as classrooms, and the resulting laboratories would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.

## 0.6 SITE ANALYSIS

Five candidate sites on the Cheney campus were identified and evaluated to determine a preferred site for the a new Engineering Building. Key factors in the site selection were appropriate area available, proximity and possible connections to the existing CEB, increasing proximity to Washington Street for greater visibility to industry and community, connections to campus pedestrian and ADA circulation, and disruption to existing buildings and landscape. Topography, solar orientation, access to utilities, service access, parking impact, and future campus expansion were also considered.

EWU Engineering Building Site Plan

The site selected is Site C: Cadet Hall, which is located immediately south of the existing CEB and east of Washington Street. The site best meets the factors above and responds to EWU’s 2014 Master Plan Goals of connecting to the larger community and enhancing open space. Another benefit is this site’s proximity to the newly proposed all-electric geothermal heating and cooling plant that will service this building, removing it from the existing fossil fuel fired steam plant.

**0.7 PREFERRED ALTERNATIVE**

Satisfaction of the identified needs can best be achieved through construction of a new building on EWU’s Cheney campus integrally connected to the adjacent existing CEB. The preferred alternative will provide existing and planned Engineering programs with the contemporary, hands-on, safe teaching laboratories they need to flexibly serve existing and future engineering degrees. The new facilities will increase faculty and industry research opportunities, support community and prospective student outreach, and encourage student engagement with each other, the Engineering programs and the regional engineering industry.

The preferred alternative will construct a new four-story, 82,522 GSF facility housing engineering teaching laboratories, research laboratories, lab support facilities, work areas, and student collaboration and study areas. Square footage in the new Engineering Building is reduced by taking advantage of CEB’s strengths as a traditional classroom and office building; 39,281 GSF will be renovated where suitable for the project program. The direct connection with CEB takes advantage of offering many efficiencies such as shared departmental and instructional resources, direct access to faculty and administrative offices, shared student amenities, and reduced building envelope. 3,130 GSF of suitable space in nearby Cheney Hall will also be renovated to complete the project program.

The demolition of Cadet Hall is also included in the project scope. See Section 4.0 Site Analysis for more detailed discussion of Cadet Hall and relocation of its current program.

## 0.8 PROJECT SCHEDULE SUMMARY

|                                       |                               |
|---------------------------------------|-------------------------------|
| Predesign                             | March 2024 – June 2024        |
| Design                                | November 2025 – January 2027  |
| Building Permit                       | November 2026 – February 2027 |
| Bidding                               | March 2027 – June 2027        |
| Construction                          | July 2027 – February 2030     |
| Closeout & Commissioning              | March 2030 – May 2030         |
| Move In                               | June 2030 – July 2030         |
| Classes begin in Engineering Building | September 2030                |

## 0.9 BUDGET ANALYSIS

Escalated project costs for the Engineering Building are summarized as follows:

|                              |                      |
|------------------------------|----------------------|
| Acquisition Costs            | \$0                  |
| Consultant Services          | \$9,569,384          |
| Construction Contracts       | \$106,942,195        |
| Equipment                    | \$6,403,647          |
| Art Work                     | \$636,743            |
| Other Costs                  | \$0                  |
| Project Management           | \$4,433,304          |
| <b>Total Project Request</b> | <b>\$127,985,272</b> |

Detailed project costs have been submitted to OFM through the online Capital Budgeting System.

# 1.0 PROBLEM STATEMENT

---

- 1.1 PROBLEM STATEMENT
- 1.2 PROPOSED SOLUTION
- 1.3 STATE OF WASHINGTON CONTEXT
- 1.4 INSTITUTIONAL CONTEXT
- 1.5 OPERATIONAL CONTEXT
- 1.6 PROJECT HISTORY

## 1.1 PROBLEM STATEMENT

**EWU's high-tech, hands-on engineering pedagogy has evolved beyond its existing substandard teaching laboratory facilities, originally designed to develop high school shop teachers. This lack of suitable space for contemporary engineering education also restricts EWU from offering a Civil Engineering program which would address the critical shortage of civil engineers across Washington State and leverage EWU's existing complementary strengths in geosciences and construction management.**

EWU's Department of Mechanical Engineering & Technology (MENT) offers rigorous and pragmatic Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Applied Technology, and Construction Management degrees that prioritize hands-on training and applied learning that lead to high-paying, non-gig jobs. EWU's engineering classes are taught by faculty with industry experience. The department is housed in the 30-year-old Computing and Education Building (CEB).

MENT graduates are highly sought after in the growing Spokane and West Plains mechanical engineering marketplace—in the most recent survey, 86% of MENT graduates were employed in a job related to their degree within a year of graduation. Regional civil engineering firms often hire students from both MENT and EWU's Geosciences department due to the state-wide lack of qualified graduates in civil engineering. Given EWU's existing strengths in MENT and geosciences and the strong demand for civil engineers, EWU would like to expand its hands-on, career-oriented engineering degrees to include Civil Engineering (CE).

The high-tech, hands-on laboratory training which makes up a significant portion of MENT education currently takes place in substandard spaces with serious deficiencies consistently documented in accreditation visits. These include student safety concerns due to poor instructor sightlines, reduced overhead clearances and limited overhead services which restrict evolution with changing machine technology, aging technological infrastructure, ADA accessibility concerns, and lack of student interaction spaces. Lack of suitable space also restricts both the hiring of additional MENT faculty and the development of a CE program. Finally, the existing inadequate space has severely limited engineering research and on-campus industry collaboration.

## 1.2 PROPOSED SOLUTION

**A new Engineering Building connected to the existing Computing and Engineering Building (CEB) is the best alternative to providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing Mechanical Engineering and Technology and prospective Civil Engineering programs.**

The 82,522 GSF building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas. 42,411 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The construction of the Engineering Building will allow MENT program growth and degree production and allow EWU to offer a CE degree program, with conservative forecasting showing enrollment increasing 76% in the first ten years of building occupancy.

Enabling engineering enrollment growth at EWU will not only change students' lifelong potential but lead Washington State in solving some of the 21st century's biggest challenges.

### 1.3 STATE OF WASHINGTON CONTEXT

#### Higher Education Objectives

The Education and Research Data Center [ERDC] of the Washington Office of Financial Management has identified engineering as a STEM/High Demand field. “A Skilled and Educated Workforce 2021-22” issued jointly by the Washington Student Achievement Council, the State Board for Community and Technical Colleges and the Workforce Training and Education Coordinating Board forecasts a **65% gap in supply of engineering bachelor’s degrees** needed to meet workforce demand in Washington State in the next five years. All bachelors engineering degrees awarded by EWU apply toward filling this gap.

Source: A Skilled and Dedicated Workforce 2021-22

The same report notes that **demand for civil engineers tops the list** of the number of annual openings in top engineering jobs at a bachelor’s level. The 2023 WSAC HELM Report notes that civil engineering is and is predicted to continue to be one Washington State’s top twelve occupations for at least the next ten years at a bachelor’s and above level. 2023 WA Employment Security data predicts that **mechanical engineers ranks in the top three** in demand in engineering jobs. The Mechanical Engineering and Technology (MENT) and prospective Civil Engineering (CE) programs offered by EWU are focused on training graduates who can serve these regional needs.

Source: WA Employment Security, 2023

## **EWU Engineering Degree Production**

EWU's engineering programs are focused on educating students who seek degrees in STEM, high demand engineering professions. From 2010 through 2020, EWU's MENT program experienced strong and sustained enrollment growth. As described further in Section 1.3 Operational Context, rebuilding growth post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 53% in the first ten years of building occupancy.

### **1.4 INSTITUTIONAL CONTEXT**

EWU is in the implementation phase of a Strategic Resource Allocation project to better understand which programs (both academic and administrative) are thriving, which require additional support, and which should be eliminated or re-envisioned. From this analysis, **engineering emerged as an area for further investment.** EWU is also developing a strategic plan and examining its institutional branding and identity. An emerging theme of both efforts is a stronger institutional commitment to emphasize applied learning through serving the needs of the region. In Spring 2024, EWU adopted a revised Mission, Vision, and Statement of Values for the university.

#### **EWU's Mission & Vision:**

The proposed Engineering Building will support EWU's mission and vision by providing facilities which will encourage enrollment, support community and prospective student outreach activities with rural and underserved populations, improve the quality and safety of laboratories, and encourage student engagement with each other, the engineering programs and the regional engineering industry.

EWU Mission: Eastern Washington University provides an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence.

EWU Vision: Eastern Washington University provides an education rooted in the liberal arts, designed to address the unique challenges and opportunities facing the region. Characterized by a student-centered focus and opportunities for applied learning in high demand fields, this education creates upward social mobility and intellectual growth for our students that supports a healthy, sustainable, and economically successful region.

EWU MENT student in the Robotics Lab

## EWU's Strategic Plan

EWU's developing strategic plan (2024-2029) will be supported by the Engineering Building as described below:

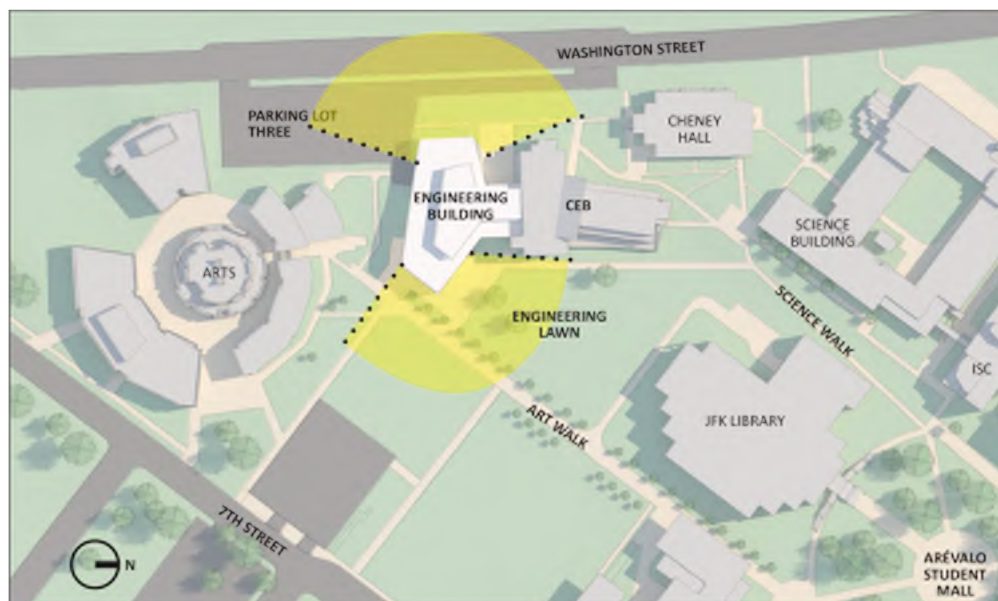

| EWU Strategic Plan Pillars  | Engineering Building's Role In Pillars   |
|---|--|
| <p><b>Accessibility.</b> Eastern Washington University strives to create a more inclusive, obtainable, and equitable college education.</p>   | <p>The Engineering Building will increase access to high demand degrees and provide critical space for community engagement with prospective rural and underserved students.</p>   |
| <p><b>Academic Excellence.</b> As a community of learners, we pursue truth and advance knowledge through creative works, research, and scholarship. Our student-centered education provides excellent teaching, dynamic conversations, and a robust intellectual experience both inside and outside the classroom. We provide applied learning opportunities to prepare students for future success, invest in our workforce and create opportunities for professional growth for students, faculty, and staff.</p> | <p>The Engineering Building's contemporary, hands-on teaching laboratories and collaboration spaces will support innovative instruction and exchange of ideas. Increased enrollment through a contemporary facility that celebrates applied learning will allow the department to add a civil engineering degree and graduate programs which will result in additional FTE faculty hires.</p>  |
| <p><b>Belonging through Justice, Equity, Diversity and Inclusion.</b> We are committed to building an inclusive, supportive, and equitable university community. We strive to integrate the principles of justice, equity, diversity, and inclusion into all university operations, fostering an environment that nurtures a sense of belonging among all members of the community. Students, staff, and faculty are seen, understood, and appreciated for the talents they bring to our educational community.</p> | <p>The Engineering Building will be a place to practice inclusive practices through the hands-on nature of the teaching laboratories, the transparency into student project laboratories, ample space to assemble and display student work, and visible spaces for team collaboration and student clubs. A central space for internal and outreach events and celebrations welcomes and invites students and faculty to participate in the larger engineering community.</p> |
| <p><b>Regional Impact and Regional Contribution.</b> We promote economic vitality and regional success through scholarly research, dedicated service, and educational programs that meet regional workforce needs in high demand fields. When combined with our commitment to a liberal arts education, we enhance social mobility, inclusivity, and the well-being of our community while remaining nimble to its ever-changing demands.</p>   | <p>Not only will the Engineering Building contribute meaningfully to the regional engineering workforce demand through increased enrollment, it will increase student and faculty interaction with the cutting-edge mechanical and civil engineering industries in the region through contemporary research laboratories and flexible space for departmental outreach.</p>   |
| <p><b>Student Success.</b> We embrace all students. Students' needs are complex, and student success requires student engagement and positive outcomes. We are committed to supporting all our students with a focus on creating conditions informed by the needs of our first-generation, low-income, and other structurally marginalized students</p>   | <p>The Engineering Building will be a student-centered environment. Its high quality, hands-on teaching and project laboratories, flexible work areas and student interaction spaces will inspire and fully support their unique engineering interests and ideas through degree completion.</p>  |
| <p><b>Sustainability.</b> We are leaders committed to sustainability as a balance between the needs of the environment, the needs of the economy, and equitable outcomes for current and future generations.</p>  | <p>The Engineering Building will be a living laboratory for sustainable facility design, with building systems on display for faculty and students. A civil engineering program helps to sustain the local economy and infrastructure.</p>   |

## EWU's Master Plan

In 2014, the university updated the Cheney Campus Comprehensive Master Plan. In Horizon 1 (2013 to 2023) 1.4.5, the plan states: *Construct addition to the Computer and Engineering Sciences Building.* EWU's planning process integrates comprehensive campus planning with its facilities master plan and ten-year capital plan. This process provides short and long-range planning that is thoughtful and targeted but still dynamic and flexible enough to meet current and future campus needs.

The Master Plan describes five planning principles which the Engineering Building follows:

- *Carefully evaluate each project with regard to renovation vs. replacement opportunities*  
See Section 3.0 for renovation vs. replacement studies.
- *Locate and size all new or replacement buildings to optimize site utilization*  
See Section 4.0 for site optimization studies.
- *Improve the overall character of the campus with the implementation of each project*  
The Engineering Building will have two front doors to engage students on campus at the Engineering Lawn and the regional community on Washington Street. It will be visible from the southeast corner of Arévalo Student Mall at the entry to the Art Walk.
- *Create and follow a framework that welcomes EWU's neighbors and accommodates future campus expansion beyond existing boundaries*  
The building has been intentionally sited on Washington Street to present a new, dynamic front door for the Engineering Department and EWU that is highly visible and accessible to the surrounding community. Space for community outreach programs and events will be located just inside the Washington entrance.
- *Reinforce and improve the overall cohesion of campus, specifically linkages across Washington Street, whenever possible*  
Extending the Engineering Building to the East from Washington Street introduces a strong edge to the existing Engineering Lawn, complementing the edge created by JFK Library. The Engineering Building's student entrance on the Engineering Lawn and a new pathway to this entrance from Science Walk will further activate the Engineering Lawn. The building will improve and the pedestrian experiences of the Art Walk and 7th Street.

Engineering Building Site Plan: Dual Orientation Toward Washington & the Engineering Lawn

### **Background**

The Computing and Engineering Building (CEB) was built as a traditional classroom and office building in 2005 to house the then intertwined departments of computer science and engineering. In the years since, the disciplines have grown into three distinct departments, each of which has seen dramatic growth in employer demand for bachelor degree graduates.

Since their creation, the disciplines have also seen significant shifts in the greater Spokane region. The regional computer science industry has grown and consolidated in the Spokane City Center and mechanical engineering has taken center stage as Spokane and West Plains mechanical engineering companies have emerged as major players in their markets. EWU has been a long-time leader in regional bachelor degree production for the engineering disciplines; the Computer Science BS was accredited in 1986, the Mechanical Engineering Technology BS in 1990, the Electrical Engineering BS in 2005, and the Mechanical Engineering BS in 2011.

To reflect these regional shifts and to keep up with demand for graduates, EWU's Computer Science and Electrical Engineering programs relocated to EWU's Catalyst Building in downtown Spokane in fall 2020, allowing engineering facilities on EWU's Cheney campus to focus on the Mechanical Engineering, Mechanical Engineering Technology, Manufacturing, Construction Management, and Technology degree programs.

### **Mechanical Engineering and Technology**

EWU's Department of Mechanical Engineering and Technology (MENT) offers rigorous and pragmatic degrees that prioritize hands-on training and applied learning. The majority of students are enrolled in Mechanical Engineering, Mechanical Engineering Technology, Applied Technology, Construction Management Technology, and Manufacturing Technology. The majority of faculty in MENT have extensive industry experience. Majors in the MENT department make up approximately 5.5% of EWU's total undergraduate enrollment, while majors in all of the engineering and computer science disciplines constitute approximately 12.5% of the total undergraduate enrollment.

A unique aspect of EWU's engineering programs is that the robotics and automation curricula are housed within MENT, rather than the more conventional home in Electrical Engineering. This gives an inherently more interdisciplinary approach to training students with an interest in moving directly to the workforce. By training students with a mechanical engineering background how to program and operate industrial robots and Programmable Logic Controllers (PLCs), EWU's

EWU MENT student in the Robotics Lab

MENT graduates enter the workforce with an unusually holistic understanding of advanced manufacturing processes. MENT students combine experience programming an industrial robot or manufacturing line with a deep understanding of the physical systems themselves (e.g. manipulators, grippers, material strength, etc). The curriculum is built specifically to address the needs of regional industry that focuses on advanced manufacturing, large scale mechanics, and heavy industry robotics. EWU's degree programs involve classroom, laboratory and project work that results in graduates who have not only learned about mechanical engineering, they know how to apply it.

The MENT department at EWU strives to ensure that students graduate with a resume not just a diploma. Career placement data demonstrates that EWU's MENT graduates are sought after in the marketplace. A 2019 survey of recent MENT graduates showed that 86% of MENT alumni report that they are employed full or part-time in the year following graduation, with most students employed within the first six months after graduation. This number has held steady over more recent years. 55% of the ME and MET respondents also reported salaries over \$60,000 *in their first year*.

### **New Degrees**

Introducing a Civil Engineering degree has been a long-time goal of EWU. The university has made this top priority as the region continues to forecast high demand for civil engineers into the next decade. EWU's plan is to differentiate its approach to Civil Engineering by leveraging the breadth of disciplines represented in the College of STEM, ranging from the natural sciences to the engineering fields. In addition to the robust Mechanical Engineering program and workforce-oriented Construction Management degree, EWU has a Geoscience department with historical strengths in geotechnical engineering, GIS, and remote sensing. Planning for EWU's Civil Engineering degree is a collaborative initiative of MENT and Geosciences. The planned program will emphasize energy-efficient infrastructure, "green" building design and construction, sustainable infrastructure development, low-impact development techniques, and sustainable materials.

To meet the increasing need for specialized and advanced training in industry, EWU also plans to expand its graduate curriculum to include programs such as a Masters degrees in Mechanical Engineering and Civil Engineering. It will be impossible to introduce these additional programs and degrees in the future without quality teaching and research laboratory spaces.

EWU MENT teaching lab facilities with substandard overhead clearances in the CEB basement

## Existing Facilities

EWU's engineering programs had their roots in an earlier program primarily focused on training high school Career and Technical Education teachers (e.g. shop, graphic design, and electrician teachers). EWU began to transition these programs to true engineering degrees in the late 1990s; the new engineering programs were still in their infancy when CEB was constructed in 2005. The basement of CEB, where the primary MENT teaching labs are located, was programmed and built to reflect those early needs and philosophy. The engineering programs have changed dramatically since that time, now producing Mechanical Engineering and Mechanical Engineering Technology graduates prepared for cutting-edge jobs at engineering and advanced manufacturing companies throughout the region.

While moving Computer Science to Spokane resulted in some vacant computer laboratories in CEB, these spaces are not suitable for the majority of MENT or CE teaching laboratories due to their minimal mechanical, electrical and plumbing services and overhead clearances. The basement of CEB contains the only spaces in the building with the mechanical, plumbing and electrical capabilities required for the hands-on materials and machine laboratory training which makes up a significant portion of MENT education. As noted previously, the basement of CEB is cramped and dark; not an inspiring place to spend two to four years earning a degree.

EWU MENT large student projects workspace & storage in loading door pathway

While there has not been certification difficulty to date, accreditors consistently cite strong concerns regarding capacity and safety issues in the existing CEB engineering laboratories. A primary concern of both faculty and accreditors is student safety due to poor sightlines in these spaces. Overhead clearances do not allow the relocation and addition of certain equipment, and overhead services are minimal resulting in space that is inflexible to the constantly evolving requirements of the field.

The lack of flexible, interdisciplinary collaboration spaces will also make future degree certification challenging. Students must complete a team capstone project to graduate. There is limited space for student teams to meet to develop their projects, so students work in circulation zones or amidst laboratory machine areas, adding to safety concerns. These projects are often physically large and need to be located near hand-on laboratory spaces during their production. The very limited storage space in the CEB basement is not only insufficient for the current number of capstone projects but nonexistent for large projects which results in them being stored in teaching laboratories or circulation zones which, in turn, become even more crowded and unsafe.

In 2006, several rooms in nearby Cheney Hall were renovated to provide additional labs required by the Electrical Engineering program. Further details on the existing facilities in CEB and Cheney Hall can be found in Section 2 of this report.

### Enrollment Forecast

From 2010 through 2020, EWU’s MENT program experienced strong and sustained enrollment growth, so much so that the Department capped enrollment in 2018-2019 due to lack of facility capacity. The pandemic further depressed EWU’s engineering enrollment. Since Covid, the engineering programs have continued their strong outreach programs to rural and underserved

prospective student populations by providing hands-on engineering activities which have historically directly correlated with subsequent enrollment at EWU and in engineering degrees. MENT in particular has built and maintained strong continuation programs with community college programs to move related Associate in Arts degrees holders (AA) into engineering bachelor’s degrees at EWU. Each year, the College of STEM organizes one of the biggest STEM-focused career fairs in Washington State.

EWU MENT students in the Metalics Lab in the basement of CEB

However, in the post-Covid environment, prospective students also need to see that they'll be inspired during the process of earning a degree, and the prospect of spending two to four years in the existing cramped, dark MENT facilities in the basement of CEB does the opposite. ***A facility which forefronts MENT and CE work, including daylit hands-on laboratories and adequate student project space will encourage prospective students to see themselves at EWU and to see their success after graduation.***

Rebuilding post-Covid requires contemporary, inspiring, pedagogically appropriate facilities that can flexibly serve multiple hands-on degree programs in the future. With the introduction of a new Civil Engineering degree, conservative forecasting shows enrollment increasing 76% in the first four years of building occupancy.

### Industry Involvement & Research

EWU's Department of Mechanical Engineering & Technology has a long history of strong relationships with the regional manufacturing industry including internships, company tours, career preparedness, guest lectures and instruction, on-campus interviews and engagement events. The current facilities can no longer accommodate the increased attendance at popular events such as capstone project demonstrations and the career fair, which must be held elsewhere on campus reducing the impact of the engineering experience for prospective students and industry partners. During on-campus job interviews, students are often interviewed in groups due to lack of suitable spaces.

A department goal is to provide opportunities for students and industry partners to interact and work together in active, hands-on engineering settings at EWU. The department has provided on-campus testing and product development support to industry partners in the past, but cannot provide these capabilities currently due to limited facilities. Companies have donated major robotics equipment in the past but the department has recently declined state-of-the-art robotics equipment donations due to lack of suitable facilities. Similar donations from mechanical engineering companies are restricted by the lack of suitable facilities.

|                    | Responses | Percent |
|--------------------|-----------|---------|
| Soft Skills        | 25        | 20%     |
| Commercial Drivers | 7         | 6%      |
| Machinery          | 7         | 6%      |
| Sales              | 6         | 5%      |
| Skilled Trades     | 6         | 5%      |
| Welders            | 6         | 5%      |
| Total Responses    | 124       |         |
| <i>n=124</i>       |           |         |

Source: Washington State Regional Educational Needs Assessment 2017

The Department works closely with S3R3 (West Plains/Airport Area Public Development Authority) which states that “the West Plains Airport Area is a globally recognized innovation zone with advanced manufacturing and aerospace industry clusters.” Access to an educated workforce is critical to prospective companies and EWU's Department of Mechanical Engineering & Technology is a major contributor to building advanced manufacturing technology industries in the region.

There is strong interest by current faculty and industry in strengthening mechanical engineering and advanced manufacturing research capabilities at EWU. Given the limited existing laboratory space appropriate for hands-on engineering work and the priority to educate and graduate

students, engineering research has been severely limited and will continue to be limited without dedicated research space. An increase in faculty due to an increase in enrollment will increase the demand for research space.

### **Student Collaboration & Community Building**

The Washington State Regional Educational Needs Assessment 2017 states that “a repeated concern of local employers was the lack of soft skills among new and potential employees.” EWU’s Department of Mechanical Engineering & Technology is committed to developing graduates who not only have technical knowledge and the ability to apply it, but also have real world skills such as leadership, teamwork, and communication to succeed in their careers.

Unfortunately the current facilities do not have the student interaction and faculty-student interaction spaces to encourage the types of interpersonal interactions that develop these skills. Capstone projects are team based but there are no meeting spaces for student teams to gather in. Commuters comprise the majority of EWU students but there is limited space for students to study and interact in the current facilities.

There are limited informal meeting spaces for faculty to interact with individuals and teams of students outside of class. There is only one large meeting room in CEB. Departmental community-building events are now often too large to be held at CEB and must be held elsewhere on campus.

Student clubs have limited to no space to work or meet. For example, the SAE Baja Club has access to a small space in Cheney Hall which they share with non-engineering student clubs and the Rocketry Club borrows space in the capstone projects lab. The department expects that enrollment in these and other applied engineering clubs would increase significantly given appropriate space with greater visibility to other students.

### **Community Outreach**

Learning how to talk about their work with non-engineers is seen as a critical skill for EWU Engineering graduates, and the department supports that through community and industry outreach programs and events which the students are expected to participate in.

As noted in the Enrollment Forecast section, the Department of Mechanical Engineering & Technology has built successful outreach programs to rural and underserved prospective student populations by providing hands-on engineering activities, events and clubs with the community. It would be most impactful to host these events in the engineering facilities to inspire prospective students to visualize an inspiring college engineering experience, but the department currently cannot house these events due to the space constraints and safety concerns described earlier, and so most outreach is mobile.

## 1.6 PROJECT HISTORY

The predesign process began in 2020 with a predesign process and report centered around providing pedagogically-appropriate space for the MENT program through a series of stakeholder work sessions including administrators, faculty and staff from the College of STEM, engineering faculty and staff, EWU Facilities & Planning and LMN Architects. The report was completed at the start of the pandemic at which point University priorities shifted in response.

Four years later, new facilities for Engineering and the development of a Civil Engineering program remain on EWU's 10-year plan. The 2024 predesign report process included stakeholder work sessions with a similar range of participants which resulted in revisions to the project program space list, organizational relationships, and space use strategies which reflect the operational context described above.

# **2.0 SPACE NEEDS ASSESSMENT**

---

**2.1 ASSUMPTIONS AND GUIDELINES**

**2.2 EXISTING FACILITIES**

**2.3 SPACE NEEDS ASSESSMENT**

**2.4 SPACE REQUIREMENTS**

**2.5 TECHNICAL PROGRAM REQUIREMENTS**

**2.6 FUTURE REQUIREMENTS**

**2.7 CODES/REGULATIONS**

## 2.1 ASSUMPTIONS AND GUIDELINES

Programming is the phase in which the project needs are defined, goals are identified and initial budget information is developed. It forms the foundation upon which all subsequent design work is based. The following assumptions were utilized in forming the program requirements:

- The current MENT pedagogy and prospective CE degree require contemporary teaching laboratories, in particular hands-on laboratories with adequate space and systems.
- Each engineering major must complete a capstone project in order to graduate which require project laboratories and projects storage spaces appropriate to those projects.
- Heavy teamwork and the fact that the majority of EWU students are commuters requires adequate student interaction spaces, in particular meeting rooms, study spaces, lounge spaces, and community areas.
- The department’s continued success in prospective student outreach warrant interaction spaces for open houses, MESA activities, and other community projects which are critical to achieving EWU’s mission and vision.
- The department’s continued success in collaboration with local industry warrants interaction spaces for industry job fairs, interviews and collaboration.
- Current faculty interest in dedicated research space is strong, and projected enrollment increases will allow the hiring of new FTE faculty with similar aspirations

### Programming Standards

EWU considers a variety of space standards when planning and designing facilities described on the following pages in this section. EWU primarily relies on the design team’s careful analysis of the activities and current pedagogical standards required by the specific occupants of a facility. For the Engineering Building, EWU selected LMN Architects, a national leader in higher education architectural design, and Research Facilities Design (RFD), a national laboratory planner with extensive experience designing engineering teaching laboratories. With EWU, the LMN/RFD team has proposed laboratories, classrooms and interaction spaces based on current industry standards. This process and standards are described in this section.

FEPG: Even though existing space planning references such as the Facilities Evaluation and Planning Guide 1994 (FEPG) and the Postsecondary Education Facilities Inventory and Classification Manual 2006 (FICM) are dated and do not accurately reflect the current needs and trends in higher education, they do hold some value as a rough benchmark and EWU uses them as such. The table below shows that the program for the Engineering Building and renovated CEB and Cheney Hall meet the FEPB standards. Note that FEPG Appendix A provides a wide range of lab station sizes for mechanical engineering labs.

| FEPG room classification number | FEPG room classification type      | Project ASF per station | FEPG standard         | Meets standard (Y/N) | Comments  |
|---------------------------------|------------------------------------|-------------------------|-----------------------|----------------------|---|
| 110                             | Classroom                          | 20                      | 16-26                 | Y                    |   |
| 210                             | Class lab – mechanical engineering | 76-290                  | 175<br>(Range 35-180) | Y/N                  | Varies based on engineering equipment sizes; see FEPG Standards Appendix A; Woodshop, Metallics, Additive Manuf, Construction Materials and Concrete Labs require significant additional ASF/Station for large equipment and safe working clearances. |
| 215                             | Class lab – services               |                         |                       | N/A                  | Sized appropriately to class lab needs  |
| 230                             | Computer lab                       | 44                      | 60                    | N                    | Falls below FEPG Guidelines but meets programming need  |

Efficiency of Space Allocation in the Engineering Building per FEPG 1994 Standards

Laboratory Module: To provide a baseline planning module for programming of teaching and research laboratories, a standard laboratory module was established by Research Facilities Design (RFD) based on industry standards and applicability to the types of laboratories included in the Engineering Building project.

The proposed laboratory planning module for the building was derived by analyzing the laboratory bench, equipment, and circulation space required for the engineering functions.

The module is based on the bench space required for technical work stations, instruments, and procedures. The space required between benches is designed to allow people to work back-to-back at adjacent benches, to allow for accessibility for disabled and still allow for movement of people and laboratory carts in the aisle.

The preliminary planning module utilized for the Engineering Building is 11'-0" wide by 33'-0" deep = 363 Assignable Square Feet. This module will provide adequate bench space plus space for floor standing equipment and fume hoods, and can be divided for smaller support spaces such as storage or instrument rooms.

Class and Research Laboratories: Preliminary areas for teaching and research laboratories were assigned based on benchmarks developed by RFD from similar university laboratory facilities, reviews of sizes of existing and proposed engineering equipment required in each lab, and on discussions with the faculty, staff and administration. Areas were rounded to the nearest laboratory module. Room diagrams for each proposed laboratory can be found in the Appendix of this report.

Classrooms: One classroom is included in the project scope as the result of reprogramming existing spaces in CEB. In order to create a physical connection to the Engineering Building on the Second Floor, two classrooms will be combined into one larger classroom.

Laboratory Service: The program size of lab support spaces was based on a comparison of existing spaces to identified needs.

Office and Staff Space: Renovations to office and staff space are intended to reduce average square footage to better align with current EWU office space standards.

## 2.2 EXISTING FACILITIES DEFICIENCIES

Two facilities currently house the engineering programs at EWU: the Computing and Engineering Building (CEB) and Cheney Hall. CEB houses the majority of the engineering program.

As noted in more detail under Existing Facilities in the Problem Statement section, CEB was designed in 2005 as primarily a classroom, computer lab and office building. Only the basement of CEB has the mechanical, electrical and plumbing systems suitable for the hands-on material and machine training which makes up a significant portion of MENT and CE education. In 2006, several rooms in nearby Cheney Hall were renovated to provide additional labs required by the electrical engineering program.

The existing facilities have serious pedagogical deficiencies which have been noted by accreditors and which are at odds with the university's mission to provide an inclusive, equitable, and transformative learning experience, driving the pursuit of knowledge with affordable academic excellence. Deficiencies in the existing buildings include:

### **Pedagogical Deficiencies in the Computer Engineer Building (CEB)**

Teaching Lab Safety Deficiencies: The existing MENT program has made use of every square inch of the CEB basement, which contains the only facilities suitable for hands-on shop laboratories. In many cases due to space constraints in CEB, multiple laboratory classes that would normally be held in separate teaching laboratory facilities are being taught in the same space. This has resulted in significant safety issues noted by both faculty and accreditors due to overcrowding and confinement. The awkward shapes of existing spaces do not allow instructors to have sightlines to all laboratory participants which is critical to student safety.

Teaching Lab Technical Deficiencies: The basement of CEB is the only facility with the mechanical, electrical and plumbing systems suitable for the existing MENT and prospective CE programs. However, across the entire CEB basement, overhead clearances are minimal and do not allow the relocation and addition of certain equipment. Overhead electrical services are also minimal resulting in space that is inflexible to the constantly evolving requirements of the field. Current laboratories do not have the vibration isolation and sound insulation that is required for high level experiments and research.

Teaching Lab Logistical Deficiencies: Mechanical and civil engineering laboratories are heavy consumers of bulky materials such as metals, woods and plastics which are delivered frequently. The main loading dock is on the first floor of CEB and the current freight elevator opens directly into a primary hands-on teaching lab (metallics) in the basement. All materials must be brought through that lab to other labs adding further safety and security concerns. Interior HVAC ductwork blocks the top three-four feet of the only basement loading door (which also happens to be in the Metallics Lab), rendering it almost useless for oversized deliveries, equipment access, or tall student projects. Metals deliveries arrive on semi-trucks, but exterior loading space in front of this basement door can only accommodate small delivery vehicles.

### **Pedagogical Deficiencies in Cheney Hall**

Technological Deficiencies: The existing Cheney Hall building is unsuitable for today's educational technology. Data infrastructure—including wired and wireless connectivity—are lacking, as are appropriate audio-visual and data facilities. The building's primary and secondary electrical system are original (1967) and do not allow for the equipment associated with today's instruction delivery, particularly MENT and CE which use specialized computer software which require robust computers dedicated to those programs.

Accessibility Deficiencies: Cheney Hall does not meet current ADA requirements and can be restrictive to students with mobility issues.

Interaction Space Deficiencies: Cheney Hall completely lacks the non-classroom spaces that enable t“a robust intellectual experience both inside and outside the classroom” envisioned in the university’s values. Spaces for informal student gathering, walk-in computer labs, lounges, collaboration, and study are currently non-existent. There are no spaces for informal and non-instructional interactions.

Building Systems Deficiencies: Cheney Hall’s heating, ventilation, and air conditioning systems are of original design and installation. Systems do not meet current energy code and indoor air quality issues are prevalent in the facility. This facility’s systems shortcomings have a substantial effect on instruction in the classrooms and laboratory spaces.

### **Building Conditions Deficiencies**

Please see Appendix for the FCS reports for Cheney Hall, CEB and Cadet Hall.

Systems Deficiencies: Systems in both Cheney Hall and CEB are connected to the existing campus fossil fuel generated steam system, which does not align with Washington State’s or the campus’ decarbonization goals.

Cheney Hall Building Conditions Deficiencies: Cheney Hall was originally completed in 1966 to house the Industrial Arts program. The building is 50 years old. There have been some minor renovations of the building in 2006 and 2016. The balance of the shell and space is of original construction and condition. **The Overall Facility Condition Score for the building is 2.6.** Many of the components are in the Fair-Systems Approaching End of Expected Life Cycles with some at critical level of Needs Improvement;

Limited Functionality.

- Substructure : 2.0
- Shell : 2.3
- The substructure and the shell of the building rank in the category of “good.” The roof and windows on the facility are original installation and do not meet current state energy code. The exterior walls and roof are not insulated and affect the utility cost of heating and cooling the building.
- Interiors: 2.8
- Most the interior walls, floors and ceiling are “worn” due to age with ceiling ranking 4 or “poor”.
- Services: 3.0

The systems of the building are what show the most decline. While the Plumbing and Electrical are in the “fair” range, the HVAC and Fire Protection components are at the level of 4 and 5 “poor” equipment marginal or “unsatisfactory” system non-functioning or seriously deficient. The building HVAC system does not meet current Washington State energy code and there are reported indoor air quality issues that can only be address by a new ventilation system. The building has many Americans with Disability Act (ADA) deficits due to the age and the original design. In particular, the elevator does not meet ADA requirements for current square foot or controls location.

Computing and Engineering Building Conditions Deficiencies: CEB was completed in 2005 and soon thereafter lacked any expansion space for program growth. The 2016 Facility Condition Assessment ranks the condition of the facility as “good/excellent” with an **overall 1.6 Facility**

**Condition Score.** Though CEB's condition score is good, the only space appropriate for the existing MENT and prospective CE programs is in the basement, and that space is substandard for today's high-tech, hands-on engineering learning environments.

### 2.3 SPACE NEEDS ASSESSMENT

After right-sizing existing program, analyzing existing space proficiencies and deficiencies, and accounting for enrollment growth with a contemporary facility and new CE program, the Engineering Department is currently deficient in:

- Instructional laboratory spaces for high-tech, hands-on applied learning
- Specialized laboratory spaces for faculty, graduate student and industry research
- Specialized laboratory spaces for student clubs and outreach activities
- Flexible open work space with exterior access for project and class extension
- Break-out laboratory classroom with sufficient space for engineering demonstrations
- Meeting rooms for student-student and student-teacher interactions
- Student study spaces and lounge
- Community space suitable for department and community outreach events

#### **Open Work & Community Space (Work Area/Lobby/Demonstration Space)**

Open work and community space, the fourth and final bullets above, are currently lacking in CEB and are critical to the success of the Engineering Department. The two functions can share space and are programmed as "Work Area/Lobby/Demonstration". Below are some of the planned uses of this space:

- Double height space with direct access to the outdoors, that can be used for both project work and demonstration, is required for student success. Student projects in MENT and CE can be physically large, occasionally up to ten feet tall. The department does not currently have space to support these projects which has forced them to be housed in inappropriate locations such as labs, and it has also had the unfortunate effect of limiting students' project choices and solutions.
- To support the large number of first generation and transfer students, the department has a tradition of holding capstone events for each of the four degrees and other industry interactive events every quarter. The department's annual STEM-focused career fair is one of the largest in Washington State. No space exists in the current facilities to support these activities at the size of the current department or with increased enrollment.
- An important part of the culture and success of the Engineering Program has been repeated interaction with a wide range of industry partners. The relationships built as part of those interactions generate private support, scholarships, equipment donations, collaborative projects and research opportunities. Space for these interactive events will allow expansion of these relationships. One departmental goal is to be able to serve as a resource to engineering societies in the region to hold events in collaboration with the University.
- Frequent events with many people and objects in this space are anticipated. To accommodate these, the scale of the space both horizontally and vertically must relate to the scale of the event and must also not limit the potential of large or non-stationary student capstone projects.

## 2.4 SPACE REQUIREMENTS

### Program Room List

The program for the Engineering Building project is separated into two primary sections:

1. Engineering Building
2. CEB Renovated Spaces
3. Cheney Hall Renovated Spaces

The following tables compile the spaces that are required by the Engineering Building project program as assignable square footages.

| ENGINEERING BUILDING                  |                                    |      |       |      |               |
|---------------------------------------|------------------------------------|------|-------|------|---------------|
| SPACE ID                              | SPACE NAME                         | OCC. | ASF   | QTY. | TOTAL ASF     |
| <b>TEACHING LABS</b>                  |                                    |      |       |      |               |
| 1.01                                  | Woodshop                           | 16   | 2,904 | 1    | 2,904         |
| 1.02                                  | Metallics and Foundry              | 22   | 4,538 | 1    | 4,538         |
| 1.03                                  | HVAC                               | 8    | 1,452 | 1    | 1,452         |
| 1.04                                  | Fluid Power                        | 24   | 1,815 | 1    | 1,815         |
| 1.05                                  | Construction                       | 12   | 1,815 | 1    | 1,815         |
| 1.06                                  | Construction Engineering           | 8    | 1,452 | 1    | 1,452         |
| 1.07                                  | Transportation & Pavement          | 8    | 1,452 | 1    | 1,452         |
| 1.08                                  | Environmental Engineering          | 8    | 1,452 | 1    | 1,452         |
| 1.09                                  | Fluids/Water Resources Engineering | 8    | 1,452 | 1    | 1,452         |

### Room List Summary & Net/Gross Ratio

The table below summarizes the preceding room lists and adds an industry standard net/gross ratio to achieve the total building area.

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |
| Offices & Office Support                         | 1,740         |
| Collaboration                                    | 7,180         |
| Total Engineering Building (ASF)                 | 45,387        |
| Estimated Net/Gross Ratio                        | 55%           |
| <b>Estimated Engineering Building Area (GSF)</b> | <b>82,522</b> |
| <b>CEB Renovated Spaces</b>                      |               |
| Teaching Labs                                    | 14,406        |
| Research Labs                                    | 2,863         |
| Classrooms                                       | 1,296         |
| Offices & Office Support                         | 8,809         |
| Collaboration                                    | 4,051         |
| Total CEB Renovated Space (ASF)                  | 31,425        |
| Estimated Net/Gross Ratio                        | 80%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>39,281</b> |
| <b>Cheney Hall Renovated Spaces</b>              |               |
| Teaching Labs                                    | 981           |
| Research Labs                                    | 1,836         |
| Total CEB Renovated Space (ASF)                  | 2,817         |
| Estimated Net/Gross Ratio                        | 90%           |
| <b>Estimated CEB Renovated Area (GSF)</b>        | <b>3,130</b>  |

Ratio consistent with other science buildings

## Relationships of Functions

The ideal relationships of teaching, project and research labs to each other was explored in multiple work sessions with the faculty, staff and administration. The process revealed that there were certain labs which have many preferred adjacencies and others which have few or none.

### Preferred Adjacencies

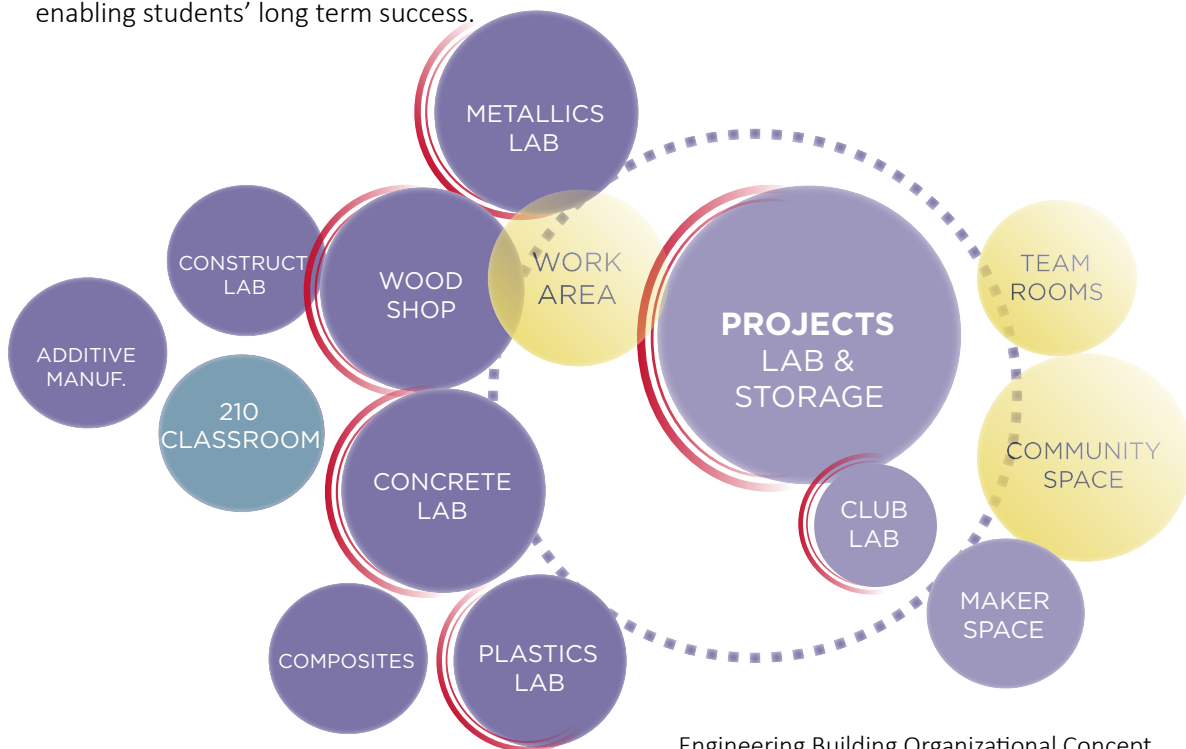

- Wood Shop, Metallics and Plastics are to be adjacent or proximate to each other
- Construction Lab is to be adjacent to Wood Shop
- Additive Manufacturing and Composites are to be proximate to Wood Shop, Metallics and Plastics
- Classroom Laboratory serves and is to be proximate to Wood Shop, Metallics and Plastics
- Work Area should be adjacent to Wood Shop, Metallics and Project Labs
- Project Labs are to be proximate to Wood Shop, Metallics and Plastics
- Project Labs and Project Storage are to be adjacent or proximate to each other
- Student Meeting Rooms (Team Rooms) are to be proximate to Project Labs, Wood Shop, Metallics and Plastics
- Club Lab should be proximate to Wood Shop, Metallics and Plastics
- Club Lab and Maker Space are to be proximate to the building entrance for outreach use
- Concrete Lab and Concrete Testing Lab are to be adjacent or proximate to each other

### Other Considerations

- Metallics would prefer a raised loading dock for semi-truck direct access into the lab
- Industry Space and Wood Shop prefer to direct loading into the labs
- Freight elevator is to be easily accessed from Wood Shop, Metallics, Plastics, Project Labs and Work Area
- Concrete Lab and Concrete Testing Lab should have direct access to the exterior

## Organizational Concept

Multiple organizational concepts for the Engineering Building were explored with the faculty, staff and administration. The diagram below shows the preferred concept which places students and their projects at its core, surrounded and supported by the labs and spaces that are most vital to enabling students' long term success.

## 2.5 TECHNICAL PROGRAM REQUIREMENTS

### Laboratory Room Diagrams and Data Sheets

Detailed preliminary laboratory room diagrams and data sheets are included in the Appendix. These documents provide the detailed program requirements for each type of laboratory space within the Engineering Building project and help to validate the program size for each.

### Building Systems Requirements

Building systems requirements are outlined in the description of major systems included in the Project Budget Analysis section of this report.

### Circulation

Effective circulation will be an important element in the design of the Engineering Building. Beyond the human occupants of the building, materials will be delivered to the facility including wood, metals, plastics and other supplies, and equipment. In addition to material delivery, the debris and waste generated by laboratory functions must be safely removed on a periodic basis.

Internal building circulation should provide safe pedestrian egress from each individual laboratory and laboratory support space through an uncomplicated path of egress to the building exterior at grade. Features that should be considered in the design of the circulation system include:

- At least one door into each laboratory space should have a minimum 54" wide clear opening. This can be accomplished using openings with one 3'-0" active leaf and one 1'-6" inactive leaf.
- Equipment lists should be carefully reviewed to verify that individual pieces of equipment can be transported and maneuvered between spaces. Future equipment should be anticipated.
- Doorways accessing corridors should open into recessed alcoves serving the corridor. The doors should swing out from laboratories, in the direction of exit.
- Wherever possible, circulation and fume hood locations within laboratory spaces should be coordinated to preclude exiting in front of the fume hoods.
- Clear, unobstructed access to the freight elevator from all labs for movement of materials, equipment and student projects is critical to the functioning of the program.

### Interaction

The program should include areas outside of laboratories that provide opportunities for students to study and interact with one another. The majority of EWU students are commuters, so it is vital that new facilities incorporate study spaces and lounge space as well as enhanced technologies to support virtual study.

The building should encourage interaction within each laboratory group, between students, researchers, and faculty, and with the larger campus. This requires that spaces that support interaction be created between laboratories, on each floor, and in public areas of building. Areas for formal and, in particular, informal interaction should be linked to the circulation schemes. Formal interaction spaces should include meeting rooms and lounge areas. Informal interaction spaces should include student study areas, casual meeting spaces for short duration interaction, display/announcement boards, and possibly outdoor gathering spaces.

Meeting rooms (programmed as "Team Rooms") should be incorporated throughout the building that facilitate groups of 4-6 students or groups of 12 for students plus faculty. These are the typical sizes of capstone project groups and engineering study groups.

## **Accessibility**

The principles of universal design should be entirely incorporated to provide an accessible environment to all of its users throughout both the building and the site. Ramps and grading should allow easy access to the building from campus buildings and parking. All spaces within the building should incorporate the ADA guidelines to allow for an easily accessible environment for all of the building occupants. Early consideration should be given to the following accessibility aspects:

- Accessible work stations and fume hoods should be provided in the laboratories based on code requirements.
- Location of accessible work stations should be as close as possible to eyewashes and safety showers.
- An 18" clearance on the pull side and 12" clearance on the push side of doors opposite the hinged side is required.

Some guidelines for accessible work stations in laboratories include:

- Work surfaces 30" - 34" above floor with wheelchair clearance below. Adjustable work surfaces can provide a range of possible height adjustments.
- Laboratory service controls, equipment, and equipment controls within easy reach for persons with limited mobility. Controls should have single-action levers or blade handles for easy operation.
- Aisle widths and clearances adequate for maneuvers of wheelchair bound individuals. Aisles 5'-0" wide are recommended with turnaround areas.

## **Vibration Control**

Some of the engineering equipment that will be used in the Engineering Building is sensitive to vibration, and some equipment creates excessive vibration. The building structure should be designed to moderate vibration to acceptable levels. Care should be taken to locate vibration creating engineering equipment where it has the least impact on other laboratories. Labs and support spaces will be designed to satisfy floor vibration criteria of VC-A (2,000 micro-in/sec. at 75 steps/min). This vibration criteria is appropriate for optical balances and microscopes up to 400x magnification, which are common in many labs. Classroom and office areas will be designed to meet the standard criteria of 0.5% g (g = force of gravity).

Air handling equipment and ductwork should be designed to minimize vibration. Supply and exhaust air fans, compressors, pumps and other noise and vibration producing equipment should be located in mechanical rooms with protective wall and floor construction. Equipment shall be isolated from supporting structure with resilient mounts. Vibration isolators should be selected based on floor stiffness, span extension, equipment power and operating speed.

## **Building Management Systems**

The Engineering Building should be provided with a micro-processor based direct digital control building automation/energy management system. This system should provide environmental and energy management controls in all spaces and monitoring of the laboratory controls. All data from the energy management system should report into the existing campus energy management control system to allow for reporting of space and system status, reporting of alarms, scheduling of preventative maintenance functions, and trending of data for energy conservation purposes.

Monitoring of critical parameters of the ventilation system will be important for safe operation and effective maintenance and management of the building. Status of HVAC operations for laboratories, fume hoods, and other critical spaces, should be reported and alarmed when outside of established operational criteria.

Besides providing a high level of control and functionality in an integrated building control system, it is also desirable to have the capability of remote data reporting on consumption gas, potable domestic water, domestic hot water, low temperature heating water, chilled water, steam, building electrical service, 208V and 460V HVAC equipment (fans, pumps, and other equipment) electrical energy use, lighting electrical energy use, electric vehicle charging energy use, plug load energy use, and on-site renewable energy generation as required by the energy code and for use by the engineering courses.

### **Technology Infrastructure**

Spaces in the new engineering building should be flexibly designed to support changing technologies and dynamic laboratory environments. Teaching laboratories should feature the latest technological tools to support teaching goals and engineering demonstrations. Technology infrastructure should be designed to meet the current needs of each lab space, while remaining flexible enough to accommodate future potential changes to lab equipment and lab functions. All labs are to have overhead services. Wireless Internet access should be provided throughout the building.

## **2.6 FUTURE REQUIREMENTS**

### **Design to Adapt to Changes**

Planning a building that can adapt to change is particularly important and challenging when designing engineering buildings because they both need to keep up with technological advancement in the field and are laden with significant scientific and safety equipment. The design of an engineering facility also commences so far in advance of actual construction that the design team must emphasize flexibility in all aspects of the project to accommodate potential pedagogical shifts. Measures to accommodate change may include:

- Planning the structural layout such that partitions can easily be deconstructed or relocated to create larger or smaller spaces as needed.
- Providing adequate floor to floor heights to accommodate future increases in ventilation requirements due to future unforeseen equipment needs.
- Avoiding the use of systems that are difficult to modify or work with.
- Selection of building systems that require little and easy maintenance and are easily accessible and adaptable.
- Selection of moveable furniture and equipment that can be easily stored.

# **3.0 ANALYSIS OF ALTERNATIVES**

---

**3.1 DESCRIPTIONS OF ALTERNATIVES**

**3.2 SUMMARY OF ALTERNATIVES**

**3.3 LIFE CYCLE COST OF ALTERNATIVES**

### 3.1 DESCRIPTIONS OF ALTERNATIVES

#### **Alternative I: Preferred Alternate - New Engineering Building on the Existing Campus**

Satisfaction of the program requirements can readily be achieved through construction of a new building on the Cheney campus providing the contemporary, pedagogically appropriate facilities needed to flexibly serve multiple hands-on degree programs including the existing MENT and prospective CE programs. It will improve the quality and safety of laboratories, increase faculty research opportunities, support community and prospective student outreach activities, and encourage student engagement with each other and the regional engineering industry.

The new structure will be designed to provide desired health, safety and functionality without compromise. The new building will connect to CEB, taking advantage of CEB's strengths, creating efficiencies such as shared departmental and instructional resources, direct access to faculty and administrative offices, and shared student amenities. The building will be a student centered environment that provides a high quality engineering teaching and research environment that is responsive to the needs of engineering education and the engineering industry.

#### **Alternative II: Renovation of Existing Engineering Facilities**

An alternative for addressing the deficiencies of the existing facilities would be a major renovation of CEB and Cheney Hall. The alternative falls short in serious ways: it is not only similar in cost to a new building, it results in substandard teaching and research laboratories and continued operational and systems inefficiencies, and it eliminates eight good quality, general use classrooms and two computer labs. Additional costs would be incurred to relocate the entire Engineering Department and others from both buildings during construction.

CEB was completed in 2005, is currently in good condition for its primary purpose as a classroom, computer lab and office building. However, the existing structure and systems of CEB are not compatible with the needs of engineering education. The ventilation demands and laboratory support systems in a engineering facility require above-average floor-to-floor heights that allow clear ceiling space for large duct work and laboratory plumbing and electrical systems. The existing CEB mechanical, engineering and plumbing systems are suited only for office, classroom and computer lab space. They are not adequate for engineering and cannot be made so without substantial demolition and reconstruction of the superstructure. Resulting labs would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.

Cheney Hall was completed in 1966 and many of the components are approaching end of expected life cycles. It currently houses a portion of the athletics department and swing space for the sciences. Both buildings do not meet current ADA, structural and energy codes.

#### **Alternative III: No Action**

The consequences of taking no action would be a negative impact on EWU students, the engineering programs, the University, the region, and the State. No action would maintain substandard, pedagogically inappropriate facilities and makes it impossible for EWU to offer new, high-demand STEM degree programs such as civil engineering. Student success in EWU's engineering programs could not be ensured. The result would be that EWU would not be able to produce more graduates in high demand engineering professions and this would undermine the policies of the Washington Student Achievement Council and the Office of Financial Management.

Additionally, the current Engineering Building would continue to have significant deficiencies in building systems, technology, student spaces and general quality. The current facilities would also continue to experience high maintenance and repair costs, which if deferred will result in facilities that are not capable of supporting even the current student load.

### 3.2 SUMMARY OF ALTERNATIVES

The following table compares the alternatives:

|                       | <b>Alternative I:<br/><i>Preferred Alternate</i></b> New Engineering Building on the Existing Campus  | <b>Alternative II:</b> Renovation of Existing Engineering Facilities   | <b>Alternative III:</b> No Action  |
|-----------------------|---|--|--|
| Description           | Design and construction of a new engineering building and targeted renovation of existing space in CEB and Cheney Hall to provide contemporary, pedagogically appropriate facilities.   | Major renovation to existing facilities, including both CEB and Cheney Hall to provide contemporary, pedagogically appropriate facilities for the engineering programs where suitable.   | No action taken.   |
| Advantages            | <ul style="list-style-type: none"> <li>- Provides sufficient high quality teaching laboratories to flexibly serve multiple degree programs over time.</li> <li>- Provides state-of-the-art engineering research facilities for faculty and industry collaboration</li> <li>- Direct connection to CEB takes advantage of CEB's strengths, creating efficiencies such as shared instructional resources, direct access to faculty and administrative offices, and shared student amenities.</li> </ul> | <ul style="list-style-type: none"> <li>- Reuses some of the existing infrastructure.</li> <li>- Cheney Hall is due for some systems and finishes upgrades.</li> <li>- No demolition of Cadet Hall or relocation of its program elsewhere on campus.</li> </ul>   | <ul style="list-style-type: none"> <li>- No demolition of Cadet Hall or relocation of its program elsewhere on campus.</li> </ul>  |
| Disadvantages         | <ul style="list-style-type: none"> <li>- Demolition of Cadet Hall and relocation of its program elsewhere on campus.</li> </ul>   | <ul style="list-style-type: none"> <li>- Majority of CEB's facilities are in good condition for their intended use as classrooms and offices.</li> <li>- Upgrading mechanical systems for lab use requires substantial demolition and reconstruction.</li> <li>- 8 good quality general use classrooms and 2 good quality computer labs in CEB would be eliminated.</li> <li>- Resulting labs would still be substandard in size and quality due to restricted dimensions and existing low ceiling heights.</li> <li>- Additional costs will be incurred to relocate occupants during construction.</li> </ul> | <ul style="list-style-type: none"> <li>- EWU's engineering programs would maintain substandard, pedagogically inappropriate facilities.</li> <li>- EWU will not be able to offer new, high-demand STEM degree programs such as civil engineering.</li> <li>- Student success in EWU's undergraduate engineering programs is not ensured.</li> <li>- EWU would not be able to produce more graduates in high demand engineering professions undermining the policies of the Washington Student Achievement Council and the Office of Financial Management.</li> </ul> |
| Project Costs         | \$127,985,272   | \$127,403,050  | \$0  |
| Construction Schedule | Start: July 2027<br>Midpoint: November 2028<br>Completion: February 2030  | Start: July 2027<br>Midpoint: December 2028<br>Completion: April 2030  | No Construction  |

See Financial Assumptions tab for more detailed information

COP Deferred and 63-20 Financing defer the payment on principle until construction completion.

**New Lease Assumptions**

Real Estate Transaction fees are 2.5% of the lease for the first 5 years and 1.25% for each year thereafter in the initial term of the lease.

Tenant Improvements are typically estimated at \$19 per rentable square foot.

IT infrastructure is typically estimated at \$1500 per person.

Furniture costs are typically estimated at \$7000 per person and do not include new workstations.

Moving Vendor and Supplies are typically estimated at \$300 per person.

**Default Ownership Options Assumptions**

Assumes a 2 month lease to move-in overlap period for outfitting building and relocation.

Assumes surface parking.

The floor plate of the construction option office building is 25,000 gross square feet.

The estimated total project cost for construction is \$506.63 per square foot.

See the Capital Construction Defaults tab for more construction assumptions.

# **4.0 SITE ANALYSIS**

---

**4.1 SITE OPTIONS**

**4.2 CAMPUS RELATIONS**

**4.3 SITE EVALUATION - PHYSICAL ISSUES**

**4.4 SITE EVALUATION - REGULATORY ISSUES**

**4.5 SITE EVALUATION - ACCESS ISSUES**

**4.6 SITE SELECTION**

#### 4.1 SITE OPTIONS

Five candidate sites on the Cheney campus were initially identified to determine a preferred site for the Engineering Building. The predesign process highlighted that locating the Engineering Building immediately adjacent to CEB for the purposes of sharing resources and encouraging interaction between engineering disciplines was very important. This intention remained intact through studies of several options for the location of the Engineering Building. Ultimately, three sites adjacent to CEB were selected as alternatives worth studying for the Engineering Building.

- Site A: Cheney Hall
- Site B: Cadet Hall
- Site C: Parking Lot 3
- Site D: Engineering Hall
- Site E: Reid Hall

Evaluation of all the sites included consideration of numerous issues and those are illustrated in the table on the next page. Key factors in the site selection were appropriate area available, proximity and possible connections to the existing CEB, increasing proximity to Washington Street for greater visibility to industry and community, connections to campus pedestrian and ADA circulation, and disruption to existing buildings and landscape. Topography, solar orientation, access to utilities, service access, disruption to existing parking and future campus expansion were also considered.

See 3.6 in this section for more detail on the three sites which were chosen for further study. Site A: Cheney Hall and Site C: Parking Lot 3 were studied because of their favorable campus locations and high criteria score. These sites were not chosen because their potential connections to CEB were less favorable. Cheney Hall would be challenging to demolish as it would interrupt other University programs which also share space in the building and because of possible future uses, such as swing space for other University facilities projects.

The predesign study concluded that Site B: Cadet Hall, which is located immediately south of the existing CEB and east of Washington Street, is the most appropriate site for the new engineering building. It best meets the criteria and responds to EWU's 2014 Master Plan Goals of connecting to the larger community and enhancing open space. It has the most favorable adjacency to CEB and its location allows for new "front doors" for Engineering on Washington Street and the Engineering Lawn. This site is located within the boundaries of the Eastern Washington University's Cheney campus and is owned by the State of Washington. The site contains adequate available area that a building on the site will comply with all easement and setback requirements set forth by the University.

Rating:  
'3' = Significant Advantage  
'0' = Significant Disadvantage  
Weighing Factor:  
'5' = Most Important  
'1' = Least important

| Evaluation Criteria                             | Site Options |              |           |              |           |               |           |                  |           |              |           |

| Allows future engineering growth                | 2            | 0            | 0         | 2            | 4         | 1             | 2         | 1                | 2         | 3            | 6         |
| Disruption to existing parking                  | 1            | 2            | 2         | 0            | 0         | 0             | 0         | 3                | 3         | 3            | 3         |
| <b>Total</b>                                    |              |              | <b>88</b> |              | <b>93</b> |               | <b>87</b> |                  | <b>63</b> |              | <b>57</b> |

Please note that the scores under “Impact of Disruption to Existing Buildings” represents the relative disruption at a University level: disruption of Site A Cheney Hall will have far more impact at a University level than disruption of Sites B-E.

Cheney Hall (~30,000gsf) currently contains program for multiple departments, making the functions more difficult to replace. In the short and long term it is also considered good swing space, especially for the sciences given its existing lab amenities. Cadet Hall (~10,000gsf) currently contains non-technical program that could be housed in a variety of spaces on campus. See 4.3 in this section for further description of Cadet Hall.

## 4.2 CAMPUS RELATIONS

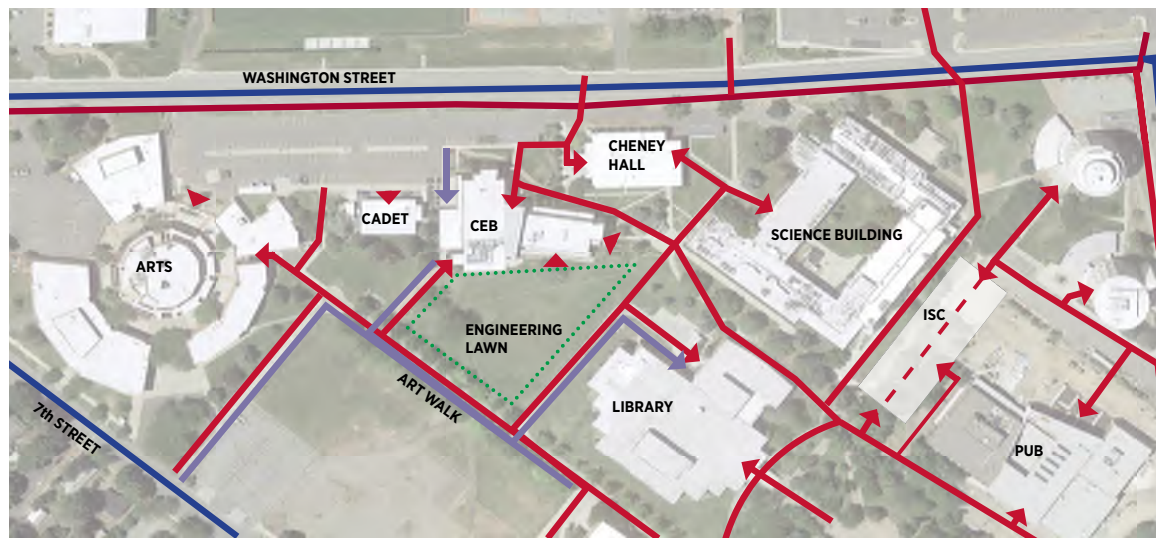

### Campus Organization

EWU's Cheney campus is currently organized around two major pedestrian circulation routes, the "Art Walk" and the "Campus Mall", and 2 major open spaces, the Campus Quad and the Engineering Lawn. The site options B, D and E are located adjacent to the main circulation route "Art Walk". The informal open lawn area adjacent to the Art Walk has been identified as the "Engineering Lawn".

### Campus Circulation and Open space

The major open spaces on campus each have a unique character that is beneficial for a diversity of uses. The Engineering Lawn area represents the largest open lawn area on the campus and is used by students for informal activities such as playing frisbee, however, the space lacks definition at the edges and is not fully integrated into campus life because of the lack of destinations around it. The major open spaces are supplemented by a large number of smaller open spaces, giving the campus a park-like feel.

The major campus circulation routes are supplemented by minor routes that link into the surrounding city grid. Building entries are generally grouped around open spaces and major pedestrian routes. There are no primary building entries to CEB currently fronting on the Engineering Lawn open space. Secondary entrances to CEB front the engineering lawn or the Science Building and are often used by students more than the primary CEB entrance which faces Washington Street.

## 4.3 SITE EVALUATION - PHYSICAL ISSUES

### Climate/ Solar Orientation

The preferred site for the Engineering Building site will require access to daylight. To optimize solar exposure and reduce unwanted glare and heat-gain, the ideal site orientation for a building in this climate will require the building to be oriented in an east-west manner. The building will be designed to allow daylight to penetrate into the building for access to the public spaces and common areas, while the light in the labs will be controlled. Building fenestration will be designed with consideration to the overall site and building orientation. Any future nearby development should be kept to three stories to maintain solar access for the Engineering Building.

Preferred Engineering Building Site Solar and Wind Orientation

### Water Rights & Availability

Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet. Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of the tap water, backflow assemblies are installed throughout the campus to protect the water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements.

A report is submitted to the Department of Health each year. EWU's water meets or exceeds all standards set for quality and safety and is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

### Stormwater Requirements

The University's stormwater system drains to the City of Cheney's street storm system, and this new engineering building will conform to the City's development manual which specifies stormwater design standards. Stormwater that runs off the vehicular service drives will be treated by a biofiltration swale system adjacent to the drive that will feed into a detention system.

### Geotechnical and Environmental Conditions

Historical geotechnical reports for CEB and the JFK Library were reviewed in order to gain a

Site Utilities Diagram

preliminary understanding of subsurface conditions in the area of campus near the candidate sites. Those geotechnical reports show that subgrade soils are generally comprised of soft to medium stiff clayey soils underlain by basalt bedrock. Pilings or geopiers supported on the basalt bedrock are generally recommended for foundations. Perched groundwater is found at various depths, sometimes near the surface, and will likely require a building to be equipped with sub-floor and perimeter drainage with collected water pumped to a disposal system or to a cistern for reuse in landscape irrigation. Since a preliminary geotechnical report on the site is beyond the reach of this predesign study, it is not possible to conclude that any of the alternatives would provide superior foundation and/or drainage conditions.

### Utility Extension

The campus tunnel system runs beneath the preferred site and currently provides direct access to steam, chilled water, telecommunications and electricity to the project. Water, sanitary sewer, storm drainage, and natural gas are separate, direct-buried utilities and are accessible to all sites. Low temperature heating water will be generated by a new open-source ground coupled heat pump heating plant. The plant is being planned as a separate project. Low temperature hot water piping is anticipated be routed across campus utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.

### Energy Conservation

Factors that may affect energy conservation in any of the site alternatives are:

- Solar orientation, both for daylighting of interior spaces and laboratories
- Adjacency to the campus tunnel system, which would allow the use of centrally generated

- steam, chilled water, and direct buried low temperature heating water
- Consolidation of energy intensive lab/shop spaces into the new addition, whose processes require large amounts of fresh air and exhaust, will allow for sustainable, energy efficient solutions that cannot be accommodated within the existing facilities due to practical spatial restraints

### **Hazardous Materials Inventory**

Cadet Hall will be evaluated for hazardous materials and all abatement completed prior to the start of any demolition work.

### **Buildings Affected by Work**

The demolition of Cadet Hall (~10,000gsf) and related site work is also included in the project scope. Built in 1955, Cadet Hall has major infrastructure issues and, if retained, a major upgrade to this building infrastructure will be needed in the future. The building is one of the smaller buildings on campus and the building's size and current organization does not allow for other University uses in the long term. The Cadet Hall site is an excellent location on campus for campus growth.

The ROTC program currently occupies Cadet Hall. EWU's Facilities and Planning feels that it is more advantageous to move the ROTC program to a new location and keep the Engineering Building in close proximity to CEB. EWU Administration has been advised that the Cadet Hall site is a high priority location and relocation of the ROTC program has not currently been a concern given that there are adequate or better spaces to house them on campus. The functions of Cadet Hall could relocate to Cheney Hall in either the short or the long term. Cheney Hall will have immediate vacancies due to the current use as science swing space. Relocation of the existing ROTC program will be carefully managed by the university.

## **4.4 SITE EVALUATION - REGULATORY & NEIGHBORHOOD ISSUES**

### **Property Setback Requirements**

The project site is situated within the existing campus and faces Washington Street to the east. Washington Street is classified by WSDOT as a Major Collector. The project will adhere to the setbacks specified by the City of Cheney and the building separation requirements of the current building code.

### **Neighborhood**

No potential issues with the surrounding neighborhood during construction or ongoing are expected or have been identified.

### **Zoning and Local Requirements**

Zoning and local land use regulations are not expected to significantly affect the preferred site. The City of Cheney designates the campus of Eastern Washington University as a unique zone called "P" (Public). The Cheney Zoning Code has no specific restrictions on the use of property within a P zone.

### **Environmental Impacts**

All sites are compatible with SEPA and LEED® requirements. There are no known environmentally sensitive conditions. Wetlands, shorelines, flood zones, endangered species, and contaminated soils are not present at the site.

### **Building Code Requirements**

The International Building Code as amended by the State of Washington has been adopted by the

City of Cheney and will govern the design and construction of the Engineering Building. Building code requirements are not expected to rule out or have a profound impact on the use of any proposed alternatives.

### **Other Regulatory Requirements**

No other regulatory requirements are expected or have been identified.

## **4.5 SITE EVALUATION - PARKING & ACCESS ISSUES**

### **Parking**

No parking issues are expected or have been identified. Parking at EWU is provided on a campus wide basis, with assigned surface parking lots and on-street parking. Parking is not specifically provided for individual buildings. The Parking Lot 3 area adjacent to CEB will be effected by all options and the loss of parking stalls will be replaced with an increase of parking in the lot just off 7th Street. Accessible parking will need to be added adjacent to the building in all site options.

### **Construction Lay-Down**

No potential impact on surroundings and existing development with construction lay-down areas and construction phasing is expected or has been identified.

### **Pedestrian Access**

Pedestrian circulation should be concentrated around the Engineering Lawn and on the Art Walk to stay within and complement existing campus organization. Pedestrian access between CEB and the Engineering Building will be at the Engineering lawn as well as a connected internal corridor.

### **Service Access**

Service access to the site can be provided via the west of the building via Washington Street for Option A. Service access can be provided via the Art Walk for Option C and Option D. Service access to the site can be provided via both Washington Street and The Art Walk for Option B, the preferred alternative. Both routes are currently used to service other buildings on the campus. If access is provided via the Art Walk, the conflict between pedestrian circulation and service vehicles will be increased, however, the University feels this is manageable.

### **ADA Access**

Primary circulation routes around the Art Walk and Engineering Lawn are generally accessible due to the relatively flat topography. The primary exception to this occurs along the area to either side of CEB and around Cadet Hall. All the schemes bridge this section of topography and provide public entries at both an upper level and a ground floor level which facilitates wheelchair access to either elevation.

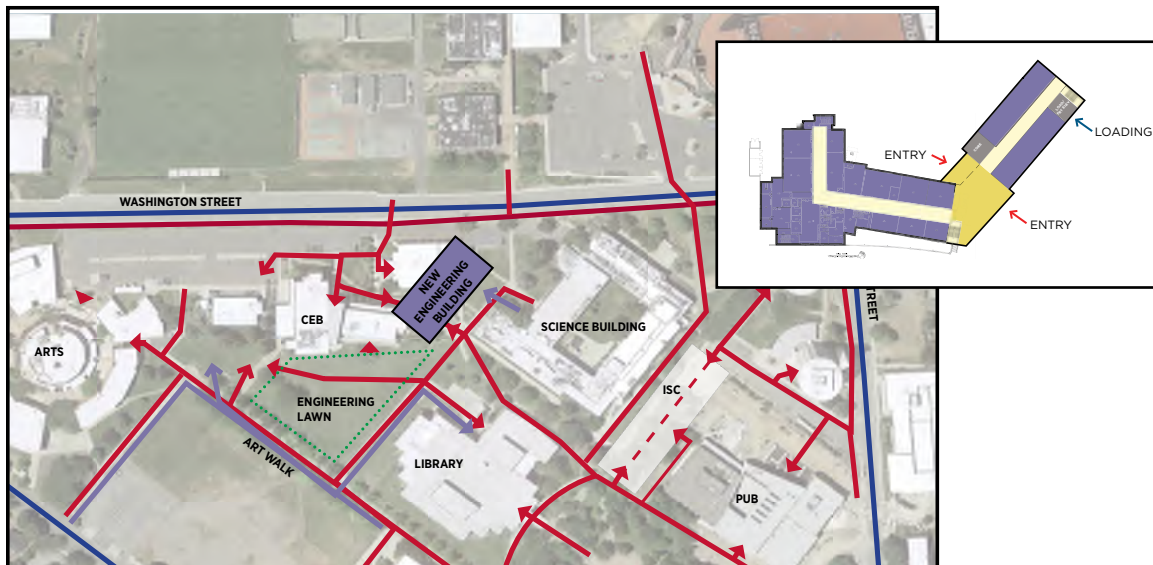

## 4.6 SITE SELECTION

Multiple potential site alternatives were studied for the location and layout of the Engineering Building. Based on a determination and evaluation of site selection criteria noted previously in this section, Sites A, B and C were selected to study in further detail. Each option evaluated the relationships of the building to the campus and to CEB. Key site relationships studied include:

- Proximity to CEB for pedestrian access and shared resources
- Proximity to Washington Street for greater visibility to industry and community
- Activation of the Engineering Lawn through proximity to CEB and the JFK Library
- Convenient service access for loading
- Future campus expansion
- Solar Orientation

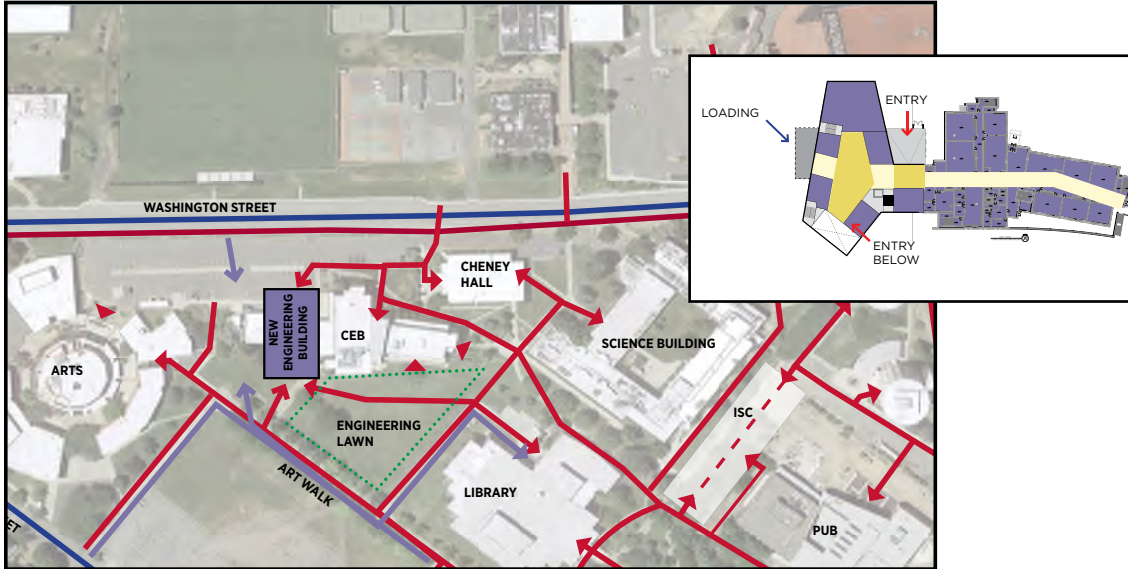

### Site A: Cheney Hall Replacement

This alternative replaces Cheney Hall and provides a direct connection to CEB along the northern stair tower and ties into the existing circulation pattern on campus. The north entrance of CEB, although not designed as the main entrance, is often used by students entering the building. This scheme would create a more successful entrance to CEB and combine it with the new entrance of the new building. It allows for loading to be shared with the Science Building. The basement of CEB could be utilized for mechanical space to limit the amount of square footage required in the

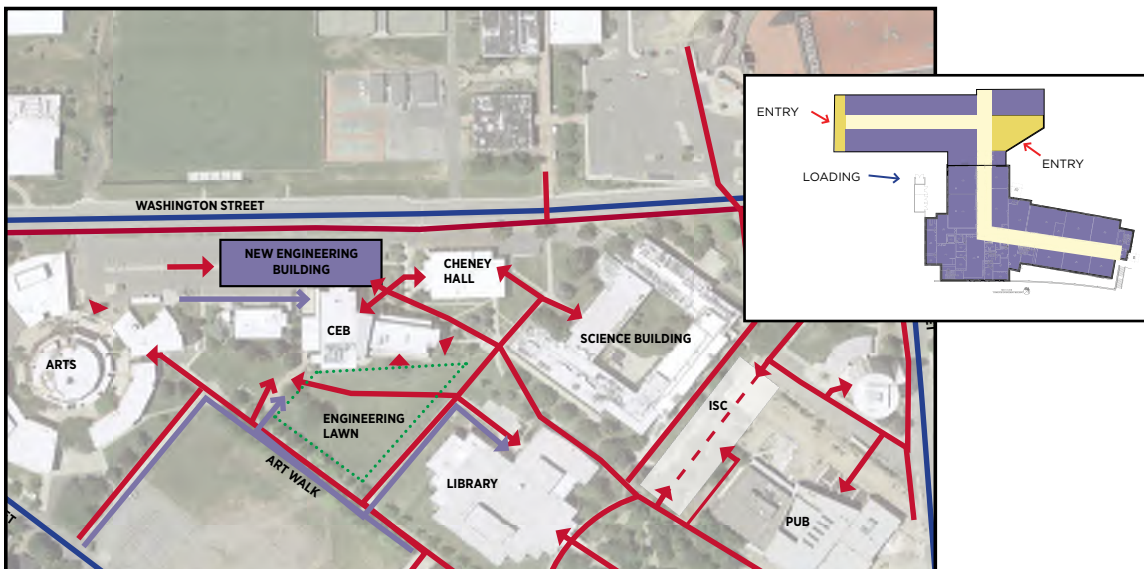

### Site B: Cadet Hall Replacement - Preferred Alternative

This scheme replaces Cadet Hall. It has both loading and entrances located towards campus at the ground level and towards Washington Street at level one. It creates two front doors and a presence to Washington street and to campus and the Art Walk. It is connected to CEB via the north/south corridor . The student entrance is facing the Art Walk and engineering lawn. This schemes east/west orientation allows for an optimal solar orientation.

### Site C: Parking Lot 3 Construction

This alternative replaces existing parking and provides a direct connection to CEB along the west stair tower and corridor. It creates a strong front door presence on Washington Street with the front facade elongated along Washington. It has a direct connection to CEB for shared resources and connection. It lacks a connection to the engineering lawn and the student entrance would be located adjacent to the CEB main entrance and Cheney Hall entrance.

**5.4 SITE PLAN**

**5.5 LONG TERM PLANS**

**5.6 LAWS & REGULATIONS**

**5.7 PROBLEMS, COMPONENTS, TECHNOLOGY, SECURITY, COMMISSIONING**

## 5.1 NATURE OF SPACE & SQUARE FOOTAGE

The preferred alternative will construct a new three story, 82,523 GSF. Engineering Building connected to the existing Computing and Engineering Building (CEB). The building will house hands-on teaching and research laboratories, lab support facilities, and student meeting and study areas.

33,530 GSF of CEB and nearby Cheney Hall will be modified to create physical connections to the new building, take better advantage of existing spaces that are suited to non-lab MENT and CE courses, and optimize instructional and operational efficiencies. The demolition of Cadet Hall is also included in the project scope. See Section 4.0 Site Analysis for more detailed discussion of Cadet Hall and relocation of its current program.

The program for the Preferred Alternative—a new Engineering Building combined with targeted renovations of CEB and Cheney Hall—was developed in conjunction with campus and Engineering Department leadership and is summarized in the following table. See Section 2.0 Space Needs Assessment for more detail.

| PROGRAM ELEMENT                                  | AREA (ASF)    |
|--|---------------|
| <b>ENGINEERING BUILDING</b>                      |               |
| Teaching Labs                                    | 31,400        |
| Research Labs                                    | 3,267         |
| Lab Support                                      | 1,800         |

Ratio consistent with other science buildings

## 5.2 OCCUPANCY

Total enrollment occupancy for the combined Engineering Building and renovated CEB and Cheney Hall project is 700 students. EWU's expectation is that this building under current growth forecasts for students and faculty would reach maximum capacity at about 15 years after opening. The objective will be to occupy and reach capacity as quickly as possible. EWU is continuously reviewing faculty hiring, enrollment data and projections, curriculum requirements, scheduling, class sizes, etc to identify a maximum enrollment capacity.

### 5.3 BUILDING CONFIGURATION

The below axonometric drawing illustrates the basic, four-story, configuration of programmed spaces in the preferred alternative. The project primarily consists of a new facility—to the left of the red line—that contains teaching laboratories, research laboratories, and collaborative working spaces. The new building has an integral connection to the existing Computing and Engineering Building (CEB)—to the right of the red line—some of which will be modified to complete the project program. See Project Drawings section for more detailed floor plans and 3d views.

## 5.4 SITE PLAN

### Site Features

- 1) Northwest Entrance Plaza- One of two primary building entries is located off the Art Walk and faces the Engineering Lawn.
- 2) Washington Entrance- One of two primary building entries provides access from Washington Street, off of Parking Lot Three.
- 3) Connection to CEB- Continuation of CEB's north-south circulation corridor into the building on Ground, First and Second Floors.
- 4) Utility Tunnel- A branch utility tunnel connects a partial mechanical basement with the existing campus utility tunnel that runs under the building.
- 5) Service Yard- Located adjacent to the parking lot, includes electrical equipment such as transformers, and trash/recycle;
- 6) Loading Dock- Access from Washington Street through Parking Lot Three;
- 7) Raised Direct Loading Doc- From Parking Lot Three into Metallics;
- 8) Direct Loading- From Art Walk into ground level Industry Space and Northwest Entrance.
- 9) Engineering Lawn- A new path from Science Walk past CEB to the building. Enlarged hardscape work area to the east of both buildings.
- 10) Bio Infiltration Swale- A vegetative system will hold stormwater and treat stormwater from the vehicular drive

## 5.5 LONG TERM PLANS

The project is consistent with applicable long-term plans as required by RCW 43.88.110 through EWU's 2014 Comprehensive Master Plan.

## 5.6 LAWS & REGULATIONS

### Sustainable Design

Sustainable strategies to reduce and enhance the project's impact on the environment and lower its energy demand will ultimately have a beneficial effect on its longevity and operational cost. Reusing and upgrading existing buildings is the most important greenhouse gas reduction strategy in the built environment, reducing air pollution, eliminating waste, and reducing the demand for new materials. There are numerous regulations and plans that point this project towards highly energy efficient and low-carbon building strategies listed below, along with many sustainability strategies that can be advanced in the next phase.

High Performance Buildings: Eastern Washington University has a proven track dating back to 2008 of designing and constructing high-performance buildings using the LEED rating system. This project will select design consultants who embody EWU's sustainability objectives. This project will be designed, constructed, and certified to the LEED Silver Standard, as a minimum, in accordance with RCW 39.35D. A LEED Checklist, outlining a preliminary approach to silver, has been included in the Appendix. EWU has had a history of achieving LEED silver or higher and will strive to achieve LEED gold or platinum on this project.

State Efficiency and Environmental Performance: The Governor's Executive Order 20-01 mandates high performance buildings for reduction of greenhouse gases, reduction of pollutants from fossil fuels, and the use of clean energy when technically and economically feasible. Eastern Washington University acknowledges that the costs of constructing zero energy or zero energy capable buildings are nearing parity with conventional buildings. Consequently, the university will further progress its building construction endeavors toward this directive, employing life-cycle cost analysis tools to inform decision-making throughout the design process. The life-cycle cost analysis performed as part of this predesign included the evaluation of a net zero building. In studying the use of photovoltaic (PV) solar panels for on-site renewable energy generation, the required area of PV panels exceeded the available roof area and would require additional dedicated site area. PV panels required by the Washington State Energy Code will be installed.

State Energy Standards for Clean Buildings: The Department of Commerce, through RCW 19.27A.210, has developed standards for reducing greenhouse gas emissions from the building sector as published in the Washington State Clean Buildings Performance Standard (2021). The Clean Building Performance Standard has established energy use intensity targets. This building is anticipated to exceed the 50,000 square feet threshold for Tier 1 Buildings, mandating compliance on the building level. EWU monitors their Energy Use Intensity (EUI) as a campus and has been evaluating their overall EUI in relation to the Washington State Clean Building Performance Standard, with a target campus EUI of 112.2. The preferred building option of this predesign is anticipated to reduce the entire campus' EUI from the current value of 118.4 closer to compliance with the Clean Building Performance Standard EUI requirement.

As of March 15, 2024, the 2021 Edition of the Washington State Energy Code has been implemented. Washington State Energy Codes are on a path towards 70% energy use reduction and the elimination of fossil fuels from buildings by 2031. With progressively more aggressive energy requirements, facilities will progress towards reducing energy consumption and associated greenhouse gas emissions, as outlined in the Greenhouse Gas Emissions Policy. The 2021 code

includes a requirement for photovoltaics panels on site. The project will be permitted under the code in effect at the time of permit which may be the 2021 codes or the 2024 codes, which are expected to be in effect November of 2026.

Required vehicle charging capabilities: Per RCW 19.27.540, where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

Greenhouse Gas Emissions Policy (RCW 70A.45.070): The referenced Revised Code of Washington regarding the greenhouse gas emissions reductions requires all state agencies to reduce greenhouse gas emissions as follows:

- i. By 2020 to 1990 levels.
- ii. By 2030 to forty-five percent below 1990 levels.
- iii. By 2040 to seventy percent below 1990 levels.
- iv. By 2050 to ninety-five percent below 1990 levels.

Eastern Washington University is committed to becoming a carbon neutral institution and a leader in sustainable practices. Part of the University's strategy to cut greenhouse gas emissions involves decreasing reliance on fossil fuels for building energy. The incorporation of energy-efficient HVAC, plumbing, and electrical systems in this proposed facility is crucial for advancing the campus's goal of reducing overall fossil fuel usage. Given that major capital projects are typically significant energy consumers, prioritizing energy efficiency in the new facility is particularly important.

This project is unique for EWU as it intends to utilize a new all electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers.

*Campus Decarbonization Plan & Climate Action Plan:* EWU is currently working on a campus Decarbonization Plan, scheduled for completion in 2025. This plan will outline the steps needed to align the campus with House Bill 1390, to decarbonize the existing central heating plant.

EWU is also updating their Climate Action Plan (CAP), which will address how the University can achieve carbon neutrality over the next 30 years. While the CAP may not be complete in the short term, design teams should consider strategies to align with the goals of carbon neutrality in the next 30 years. The electricity grid in Washington will be carbon neutral beginning in 2030, meaning a high-performance, all-electric building will meet that goal.

*Campus Decarbonization Plan & Climate Action Plan:* Supporting these plans and compliance with HB 1390, this project intends to connect to a new GeoEco central plant that utilizes an efficient, all-electric heating and cooling system produced by a ground source heat pump for heating, domestic hot water, and chilled water. This ground source heat pump system will be housed in a newly proposed central geothermal energy plant. By connecting to an all-electric heating system, this project will significantly reduce carbon emissions associated with the building when compared to the existing facility that is currently connected to the campus steam plant, which utilizes natural gas fired steam boilers. The building will also serve students and faculty as a living lab of the low-carbon energy future that they will be part of.

The building design can save cost and allow the GeoEco plant to serve more buildings by reducing peak loads through a high-performance envelope, including reasonable glazing percentage and above-code insulation, as well as high performance mechanical systems and demand response systems.

Consolidation of energy intensive lab/shop spaces into the new addition, whose processes require large amounts of fresh air and exhaust, will allow for sustainable energy efficient solutions that cannot be accommodated within the existing building due to practical spatial restraints. Energy efficient solutions include capture of waste energy from the exhaust air to pre-heat and pre-cool the ventilation air, variable flow demand-based ventilation systems, filtering and recycling air from sawdust collection systems.

ELCCA & LCCA: Washington State requires capital projects to engage in Energy Life Cycle Cost Analysis (ELCCA) per the Department of Enterprise Services (DES) Assessment as well as a Life Cycle Cost Analysis (LCCA) per the Office of Financial Management (OFM). The design team and University will strive to use these requirements as an opportunity to study high-performance design to reduce energy use and cost in detail and make informed decisions about energy-saving strategies, in line with Washington State's greenhouse reduction goals for new buildings. Meeting these requirements requires a robust energy modeling effort including ASHRAE Standard 209.

Wellness: Americans spend 90% of our time indoors, so buildings need to support human health. Part of the LEED system and EWU's mission includes supporting student wellness, beyond the air pollution and climate pollution reductions that are part of energy-related strategies above. Student health and educational outcomes can be improved through sensitive daylighting, a mix of social and separate spaces, materials selection to reduce or eliminate toxins, abundant fresh air, biophilia, access for a range of mobility and learning modes and more. Increasing the insulation value of the existing building will significantly increase thermal comfort as well. The design of the building during the next phase is critical for these goals.

EWU Campus Landscape Vision and Prairie Restoration Project: These plans work toward a resilient, sustainable campus landscape that is part of student experience and engagement towards ecological restoration. This plan includes dedicating "a third of campus land and resources for students to actively participate in a real-world, multidisciplinary project designed to restore a threatened ecosystem in our region." This includes low-maintenance Xeriscape, plantings that do not need watering after establishment, installed previously at EWU as part of the Interdisciplinary Science Center project as a water-saving feature. High performance, water-saving plumbing fixtures are anticipated in the LEED scorecard.

Embodied Carbon and the Buy Clean, Buy Fair Act: Since an all-electric building will have close to zero greenhouse gas emissions from energy use, nearly all greenhouse gases will be released in the creation, transportation, and installation of construction materials, referred to as embodied carbon. The most important embodied carbon strategy – building reuse – is already integrated into the Predesign preferred alternate. Reusing and renovating nearly all of the existing buildings means that the biggest impact materials – structure and enclosure – only need minor updates instead of building from all new materials. In the next phase additional embodied carbon reductions through material selection and specifications, especially concrete, will contribute LEED points and an overall project carbon reduction. Emerging low-carbon steel and concrete, along with mass timber, can be considered during design.

HB 1282 was passed in 2024, requiring disclosure of Environmental Product Declarations (EPDs) that include greenhouse gas emissions information for certain materials on state projects > 50,000 sf such as this one, beginning in July 2026.

## Archeological and Cultural Resources

No archeological or cultural resources are known or anticipated. Per Governor's Executive Order 21-02, EWU has initiated consultation with DAHP and affected tribes; see DAHP and Tribal Letters in the Appendix. DAHP has noted that a survey of Cadet Hall showing non-significance will be required to complete their review. This survey is in progress.

## ADA Implementation

The project complies with Executive Order 96094, the Americans with Disabilities Act.

## Planning Compliance

The Preferred Alternative complies with planning under Chapter 36.70A RCW, as required by RCW 43.88.0301.

## Information required by RCW 43.88.0301(1)

|                               |   |
|-------------------------------|---|
| RCW 43.88.0301(1)(a)(i):      | No  |
| RCW 43.88.0301 (1)(a)(ii)(A): | No, not within the urban growth area.<br>Yes, part of planned employment growth.            |
| RCW 43.88.0301 (1)(a)(ii)(B): | Yes. EWU growth provides growth in Cheney and graduates with skills used by local industry. |
| RCW 43.88.0301 (1)(b)(i):     | Yes   |
| RCW 43.88.0301 (1)(b)(ii):    | No  |
| RCW 43.88.0301 (1)(b)(iii):   | Yes   |

## Other Codes & Regulations

EWU engineering building is expected to comply with the following codes:

|                |  |
|----------------|--|
| Building       | International Building Code, latest edition with Washington State amendments, WAC 51-50  |
| Fire           | International Fire Code, latest edition with Washington State amendments, WAC 51-54<br>NFPA 13 Standard for the Installation of Sprinkler Systems  |
| Mechanical     | International Mechanical Code, latest edition with Washington State amendments, WAC 51-52  |
| Plumbing       | Uniform Plumbing Code, current Washington State-required edition with amendments, WAC 51-56 & 57   |
| Electrical     | National Electric Code, current Washington State-required edition, WAC 296-46B   |
| Energy         | Washington State Non-Residential Energy Code, latest edition, WAC 51-11  |
| Accessibility  | Accessible and Usable Buildings and Facilities, ICC/ANSI 117.1, current Washington State-required edition  |
| Air Quality    | Washington State Ventilation and Indoor Air Quality Code, WAC 51-13  |
| Elevators      | American Society of Mechanical Engineers (ASME) A17.1, current Washington State-required edition   |
| Sustainability | High-performance public buildings (Chapter 39.35D RCW).<br>State efficiency and environmental performance (Executive Order 20-01)<br>State Energy Standards for Clean Buildings (RCW 19.27A.210)<br>Greenhouse Gas Emissions Policy (RCW 70A.45.070) |
| Seismic        | American Society of Civil Engineers Minimum Design Loads for Buildings and Other Structures ASCE 7-16  |

EWU Engineering building is expected to comply with the following standards:

- American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

- ASHRAE Standard 62.1 – Ventilation for Acceptable Indoor Air Quality
- ASHRAE Standard 55 – Thermal Comfort
- Sheet Metal Contractors Association of North America (SMACNA)
- American Society of Plumbing Engineers (ASPE)
- Eastern Washington University, Design and Construction Guidelines

### **Preliminary Building Code Analysis**

The following code analysis identifies critical issues in the 2021 International Building Code that must be addressed during the design process; however, it is not intended as a complete investigation of relevant code requirements.

Use and Occupancy Classification (Chapter 3): The building occupancy will be classified as Group B, with Group S-2 spaces for low-hazard general storage and possibly Group H-2 spaces for hazardous storage.

Construction Type (Chapter 5): Type II-A, fully sprinklered construction is assumed for this report.

Building Height and Area (Chapter 5): Predesign concept plans have determined that the Engineering building will be 3 stories in height, with total size of about 82,500 gross square feet. The largest single floor will be approximately 26,000 square feet. Type II-A fully sprinklered buildings with Group B occupancies are allowed to be up to 112,500 square feet per story, up to 85 feet in height, and a maximum of 6 stories tall. H-2 occupancies are allowed on any floor up to two stories above grade.

Fire Resistive Construction (Chapter 6 & 7): Per IBC 602.2, all building elements are to be of noncombustible construction.

| <u>Building Element</u>     | <u>Required Rating</u>                               |
|-----------------------------|--|
| Structural Frame            | 1-hour   |
| Exterior Bearing Walls      | 1-hour   |
| Interior Bearing Walls      | 1-hour   |
| Exterior Non-bearing Walls  | Unrated with greater than 30-foot separation         |
| Int. Non-bearing Partitions | Unrated unless providing required separation         |
| Floors                      | 1-hour   |
| Roofs                       | 1-hour   |
| Shaft Enclosures            | 1-hour   |
| Exterior Openings           | Unprotected with no limit if over 20-foot separation |

Note: The provision of an automatic fire sprinkler system through the building may eliminate the requirement for 1-hour fire resistive construction in some building elements.

Occupant Load (Table 1004.1.1):

| <u>Area</u>      | <u>Occupant Load Factor</u> |
|------------------|-----------------------------|
| Classrooms       | 20 sf/ occupant             |
| Laboratories     | 50 sf/ occupant             |
| Offices          | 150 sf/ occupant            |
| Storage          | 300 sf/ occupant            |
| Mechanical Rooms | 300 sf/ occupant            |

Egress Requirements (Chapter 10):

| <u>Egress Element</u> | <u>Requirement</u>   |
|-----------------------|--|
| Exit Width            | Stairs: 0.3"/ occupant, minimum 44" wide for occ. load > 50  |
| Door Width            | 0.2"/ occupant, minimum 32" wide clear opening   |
| Exit Corridors        | Minimum 44" wide   |
| Number of Exits       | 2 when occupant load > 50, 3 when occ. load > 500  |
| Exit Location         | Exits shall be located at a distance apart equal to not less than one third of the length of the maximum diagonal dimension of the building or area served, where building is equipped with automatic sprinkler systems. |
| Travel Distance       | Travel distance shall not exceed 300' in a sprinklered. Group B occupancy. H-2 occupancies are limited to shorter allowable travel distances, 100'.  |

## 5.7 PROBLEMS, COMPONENTS, TECHNOLOGY, SECURITY, COMMISSIONING

Problems Requiring Future Study: No problems requiring future study have been identified.

Significant Components: No significant or distinguishable components, including major equipment and ADA requirements in excess of existing code have been identified.

Planned Technology Infrastructure: The project is planned to conform with EWU's IT protocols and specifications with typical IT infrastructure for the space use types. See the Outline Specifications and Laboratory Room Data Sheets in the Appendix for more detail.

Security Measures: The project is planned to conform to EWU's security guidelines and includes typical security measures for the space use types. See the Outline Specifications in the Appendix for more detail.

Planned Building Commissioning: Building commissioning is integrated into schedule to verify via documentation that all building systems perform interactively and according to the design intent.

# **6.0 PHASING, DELIVERY, SCHEDULE & MANAGEMENT**

---

**6.1 PHASING OPPORTUNITY**

**6.2 DELIVERY METHOD**

**6.3 IMPLEMENTATION & MANAGEMENT**

**6.4 MILESTONE SCHEDULE**

**6.5 SCHEDULE FACTORS**

## **6.1 PHASING OPPORTUNITY**

The project can be phased as noted below. The decision to phase and phasing details will be determined in the Design phase. This report, including schedule and cost estimate, assumes the Engineering Building and targeted renovations of CEB and Cheney Hall occur in a single phase.

### Preliminary Phasing Strategy

- Phase 1: Engineering Building construction with connections to CEB. CEB and Cheney remain occupied during construction. Loading for CEB would occur at the Ground Floor during construction.
- Phase 2: Renovations of CEB and Cheney Hall.

## **6.2 DELIVERY METHOD**

Eastern Washington University intends to employ the traditional Design/Bid/Build approach for this project. Previous major capital projects at EWU have been successfully executed within or under the allocated budget using this method. Its cost-effectiveness aligns well with the regional context and the construction administration capabilities available to EWU. Presently, there's no compelling reason for EWU to seek approval for an alternative delivery method under RCW 39.10.

## **6.3 PROJECT MANAGEMENT**

The University's Construction & Planning office will manage the design and construction of this project. The Associate Vice President for Facilities and Planning is responsible for overall organization management. Construction & Planning provides oversight of programming; predesign; cost estimating; design and construction services for building alterations, new construction, and grounds improvements for the Cheney campus.

Project managers organize and administer the work of outside design consultants and public works contractors. They follow projects all the way through construction and work closely with clients, project architects, designers and consultants to ensure projects are on time and within budget.

The following individuals in the Construction & Planning office will oversee this project:

|             |                                   |
|-------------|-----------------------------------|
| Kris Jeske  | Director, Construction & Planning |
| Troy Bester | Senior Project Manager            |

The cost for the University's management of the design and construction is included in the Project Budget Analysis section of this report

## 6.4 MILESTONE SCHEDULE

## 6.5 SCHEDULE FACTORS

### Value Engineering and Constructibility

Value-engineering analysis and constructability review will be integrated throughout the design and building process, and the time has been factored into the schedule above.

### Project Delays

The proposed construction and completion of the new GeoEco Plant, which will provide geothermal heating and cooling to this project, is planned as a separate project. The completion of the GeoEco Plant will be required before the completion of this project, as it will serve as the sole source of building heating and domestic hot water.

### Permitting

Buildings on EWU's campus are subject to the governing codes of the City of Cheney. EWU maintains a good working relationship with the City of Cheney and discusses each project with the City prior to implementation. It is anticipated that during the design process, the university and design team will meet periodically with officials of the City to ascertain that building plans are in conformance to the City's requirements.

### Local Government Ordinances or Neighborhood Issues

No known local government ordinances or neighborhood issues.

### Local Jurisdiction & Community Engagement

The local jurisdiction will be notified during the design phase. Meetings with local engineering industry partners are planned as part of the process. Community stakeholder meetings are not currently anticipated.

# **7.0 PROJECT BUDGET ANALYSIS PREFERRED ALTERNATIVE**

---

**7.1 COST ESTIMATE ASSUMPTIONS**

**7.2 CONSTRUCTION COST ESTIMATE UNIFORMAT LEVEL II SUMMARY**

**7.3 PROPOSED PROJECT COST**

**7.4 FURNITURE, FIXTURES & EQUIPMENT**

**7.5 PROPOSED FUNDING**

**7.6 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS**

**7.7 C100**

## 7.1 COST ESTIMATE ASSUMPTIONS

The following assumptions have been made as the basis for the Engineering Building project budget:

- The Engineering Building and targeted renovations to CEB and Cheney Hall will be constructed as a single phase.
- The construction start date will be July 2027.
- The construction period will be 32 months.
- Design/Bid/Build delivery method will be utilized.
- The project will follow the Outline Specifications included in the Appendix of this report.
- The Engineering Building will be designed to achieve a minimum LEED silver rating.
- The Engineering Building will be designed to comply with the codes and standards cited in this report.
- New mechanical, plumbing and electrical services will be provided complying with local building codes and campus standards.
- Heating and domestic hot water to the Engineering Building and renovated CEB will be provided by a connection to a new campus low temperature heating water (LTHW) system which is a separate campus GeoEco Plant project. This system will operate at 120°F. 50' of dedicated 6"Ø low temperature hot water supply and return piping is anticipated be routed across from mains installed as part of the GeoEco Plant project to the building utilizing direct buried, insulated, jacketed, and fusion-welded high temperature HDPE SDR-11 pipe.
- New utility tunnel connections will bring campus steam, chilled water, electrical and telecommunications to the buildings.
- The Engineering Building will be sprinklered throughout.
- Approximately 24 of the existing parking stalls will be removed and/or relocated as part of this project. A new loading zone from Washington Street via Parking Lot Three will be constructed.
- Subgrade soil conditions are expected to be similar to those at nearby buildings. A geotechnical investigation for the site has not been completed. Soils reports from the adjacent JFK Library and the nearby CEB indicate that site soils consist of a thin stratum of topsoil over medium stiff clayey silt or clay (Palouse formation) over stiffer Saprolite clays over basalt bedrock.
  - ❖ At CEB the clays extend down to as deep as 40 feet with groundwater encountered at 10 to 15 feet deep, and foundations consist of spread footings over rock bearing pads, which are located in stiffer Saprolite clays below the Palouse formation layer.
  - ❖ At JFK the site is clay silt over basalt bedrock at depths ranging from 12-17.5 feet below grade with ground water present, and the foundations are taken to bedrock utilizing concrete piers, and there is a foundation dewatering system.
  - ❖ The adjacent campus utility tunnel has dewatering sumps that pump to the stormwater system.
  - ❖ The presence of groundwater is expected on the project site, necessitating the inclusion of a permanent dewatering system for the utility tunnel connection and basement area.

## 7.2 CONSTRUCTION COST ESTIMATE UNIFORMAT LEVEL II SUMMARY

A detailed construction cost estimate for new building, existing building work and site improvements was prepared by a professional cost estimator. See Appendix for detailed estimate.

### New Engineering Building Construction:

|  |                                   |                     |
|--|-----------------------------------|---------------------|
| A10  | Foundations                       | \$1,267,643         |
| A20  | Basement Construction             | \$575,940           |
| B10  | Superstructure                    | \$5,812,905         |
| B20  | Exterior Closure                  | \$3,681,412         |
| B30  | Roofing                           | \$1,168,398         |
| C10  | Interior Construction             | \$3,119,207         |
| C20  | Stairs                            | \$175,000           |
| C30  | Interior Finishes                 | \$3,392,694         |
| D10  | Conveying                         | \$525,000           |
| D20  | Plumbing Systems                  | \$3,465,924         |
| D30  | HVAC Systems                      | \$8,912,376         |
| D40  | Fire Protection Systems           | \$453,871           |
| D50  | Electrical Systems                | \$8,087,156         |
| E10  | Equipment (built in)              | \$3,213,230         |
| E20  | Casework & Furnishings (built in) | \$918,880           |
| Subtotal New Building Construction             |                                   | \$44,769,635        |
| <u>Design Contingency/ Contractor Overhead</u> |                                   | <u>\$12,714,576</u> |
| Total New Building Construction Cost           |                                   | \$57,484,211        |

### Existing CEB Building Construction:

|  |                                   |                    |
|--|-----------------------------------|--------------------|
| C10  | Interior Construction             | \$1,135,668        |
| C30  | Interior Finishes                 | \$1,291,712        |
| D20  | Plumbing Systems                  | \$522,437          |
| D30  | HVAC Systems                      | \$3,894,156        |
| D40  | Fire Protection Systems           | \$145,340          |
| D50  | Electrical Systems                | \$1,924,769        |
| E10  | Equipment (built in)              | \$261,544          |
| E20  | Casework & Furnishings (built in) | \$304,035          |
| F20  | Selective Demolition              | \$336,500          |
| Subtotal Existing CEB Building Construction    |                                   | \$9,816,161        |
| <u>Design Contingency/ Contractor Overhead</u> |                                   | <u>\$2,577,724</u> |
| Total Existing CEB Building Construction Cost  |                                   | \$12,393,885       |

### Existing Cheney Building Construction:

|   |                                   |                  |
|---|-----------------------------------|------------------|
| C10   | Interior Construction             | \$22,532         |
| C30   | Interior Finishes                 | \$109,160        |
| D20   | Plumbing Systems                  | \$41,629         |
| D30   | HVAC Systems                      | \$157,345        |
| D40   | Fire Protection Systems           | \$11,581         |
| D50   | Electrical Systems                | \$153,370        |
| E10   | Equipment (built in)              | \$25,226         |
| E20   | Casework & Furnishings (built in) | \$23,475         |

|     | <b>Escalated Maximum Allowable Construction Cost (MACC)</b> | <b>\$92,961,240</b> |

### 7.3 PROPOSED PROJECT COST

Escalated project costs for the Engineering Building are summarized as follows; detailed project costs have been submitted to OFM through the online Capital Budgeting System.

|                              |                      |
|------------------------------|----------------------|
| Acquisition Costs            | \$0                  |
| Consultant Services          | \$9,569,384          |
| Construction Contracts       | \$106,942,195        |
| Equipment                    | \$6,403,647          |
| Art Work                     | \$636,743            |
| Other Costs                  | \$0                  |
| Project Management           | \$4,433,304          |
| <b>Total Project Request</b> | <b>\$127,985,272</b> |

**7.4 FURNITURE, FIXTURES & EQUIPMENT:** Included in the project budget.

**7.5 PROPOSED FUNDING:** The Engineering Building will be a State funded project.

### 7.6 FACILITY OPERATIONS AND MAINTENANCE REQUIREMENTS

#### Assumptions

The following estimates of operations and maintenance costs, including FTEs, for the Engineering Building are based on the “EWU’s Annual Cost per Gross Square Foot” for FY24. Costs are escalated at an inflation rate of 3.0 % per year. Through careful project sequencing and/or phased construction, moving costs are estimated to be minimal. No additional operating costs are anticipated after the renovations of CEB and Cheney Hall.

#### Impact & Agency Responsible

The Engineering Building project will be maintained by the Owner. It will result in an increase to operations and maintenance costs for the campus. The new building will require an increase in the custodial staff, maintenance staff, goods and services, and utility costs.

#### Operations and Maintenance Cost

Current campus operations and maintenance costs for FY25 are shown in Table 1. For the Engineering Building, the projected operations and maintenance costs for the first full year of occupancy (FY2030) and five subsequent biennia are shown in Table 2.

Table 1: Operations and Maintenance - Current Campus

| Operations                         | Operating cost GSF/YR |
|------------------------------------|-----------------------|
| Component :                        | FY25                  |
| 091-Utilities                      | \$3.89                |
| 092 - Bldg & Utilities Maintenance | \$2.73                |
| 093 - Custodial & Grounds Service  | \$3.56                |
| 094 - Ops & Maintenance Support    | \$3.73                |
| Total Annual Per GSF               | \$13.91               |

Table 2: Operations and Maintenance - Projected Engineering Building

| Operations                          | Operating cost GSF/YR | Cost 2032   | Cost 2034   | Cost 2036   | Cost 2038   | Cost 2040   |
|-------------------------------------|-----------------------|-------------|-------------|-------------|-------------|-------------|
| Component :                         | FY30                  |             |             |             |             |             |
| 091-Utilities                       | \$4.51                | \$4.78      | \$5.08      | \$5.38      | \$5.71      | \$6.06      |
| 092 - Bldg. & Utilities Maintenance | \$3.16                | \$3.36      | \$3.56      | \$3.78      | \$4.13      | \$4.25      |
| 093 - Custodial & Grounds Service   | \$4.13                | \$4.38      | \$4.64      | \$4.93      | \$5.38      | \$5.55      |
| 094 - Ops & Maintenance Support     | \$4.32                | \$4.59      | \$4.87      | \$5.16      | \$5.64      | \$5.81      |
| Total Annual Per GSF                | \$16.13               | \$17.11     | \$18.15     | \$19.25     | \$20.87     | \$21.67     |
| Total GSF                           | 82,522                |             |             |             |             |             |
| Total Annual Operating Cost         | \$1,330,709           | \$1,411,749 | \$1,497,724 | \$1,588,936 | \$1,722,131 | \$1,788,361 |

## 9.1 PREDESIGN CHECKLIST

### Appendix 1: Predesign checklist and outline

A predesign should include the content detailed here. OFM will approve limited scope predesigns on a case-by-case basis.

#### Executive summary

Problem statement, opportunity, or program requirement

- Identify the problem, opportunity, or program requirement that the project addresses and how it will be accomplished.
- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location, or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals, and objectives; statutory requirements; and the problem, opportunity, or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

#### Analysis of alternatives (including the preferred alternative)

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost [Model](#) (RCW [39.35B.050](#)).
    - Schedule estimates for each alternative. Estimate the start, midpoint, and completion dates.

#### Detailed analysis of preferred alternative

- Nature of space – how much of the proposed space will be used for what purpose (i.e., office, lab, conference, classroom, etc.)
- Occupancy numbers.
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site analysis:
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floorplans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
  - Consistency with applicable long-term plans (such as the Thurston County and Capitol campus master plans and agency or area master plans) as required by RCW 43.88.110.

- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter [39.35D](#) RCW).
  - State efficiency and environmental performance, if applicable (Executive Order [20-01](#)).
  - State energy standards for clean buildings (RCW [19.27A.210](#)).
  - Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW [19.27.540](#)).
  - Greenhouse gas emissions reduction policy (RCW [70.235.070](#)).
  - Archeological and cultural resources (Executive Order [21-02](#) and [Section 106](#) of the National Historic Preservation Act of 1966). If mitigation is anticipated, please note this in the predesign with narrative about how mitigation is worked into the project schedule and budget.
  - Americans with Disabilities Act (ADA) implementation (Executive Order [96-04](#)).
  - Compliance with planning under Chapter [36.70A](#) RCW, as required by RCW [43.88.0301](#).
  - Information required by RCW [43.88.0301](#)(1).
  - Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project, including impacts to current lease contracts. Include detail on the need to backfill space or cost assumptions for vacant space.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative. The proposed method of project delivery must be justified.
- Describe how the project will be managed within the agency.
- Schedule.
- Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
- Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW [43.88.110](#)(5)(c).
- Describe factors that may delay the project schedule.
- Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
- Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

### Project budget analysis for the preferred alternative

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The [C-100](#).
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
  - If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement, and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

### Pre-design appendices

- Completed Life Cycle Cost [Model](#).
- A letter from DAHP.
- Title report for projects including proposed acquisition.

## 9.2 DAHP AND TRIBAL NOTIFICATION LETTERS

Allyson Brooks Ph.D., Director  
State Historic Preservation Officer

June 13, 2024

Troy Bester  
Eastern Washington University

In future correspondence please refer to:  
Project Tracking Code: 2020-06-04168  
Property: EWU Engineering Building  
Re: More Information Needed, Survey Requested

Dear Troy:

Thank you for contacting the Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Office (SHPO) under provisions of Governor's Executive Order 21-02. Our review is based upon documentation provided in your submittal. We understand this request is only regarding the predesign of the project, and appreciate you consulting with DAHP early on in project development.

In order to complete our review, we request an intensive level survey of Cadet Hall. Cadet Hall is proposed to be demolished as part of the project scope and has not been surveyed for eligibility to the National Register of Historic Places. Cadet Hall was built in 1956 and may be significant for its association with the successful ROTC program at EWU.

Before we can assess project impact on historic resources, we need to know what historic resources are present in the project area. An [intensive-level survey](#) and updated Historic Property Inventory Form completed by a [Secretary of the Interior Qualified Architectural Historian](#) will assist us in making this determination.

These comments are based on the information available at the time of this review and on behalf of the State Historic Preservation Officer in conformance with Executive Order 21-02. Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A  
Architectural Historian

Jill Maria Wagner, PhD  
Tribal Historic Preservation Officer  
Coeur d'Alene Tribe

RE: Propose Project at Eastern Washington University  
Engineering Building  
EWU Project No. CP1141

Dr. Wagner:

This letter is to notify you of a proposed Engineering Building, on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the university will be submitting a predesign report for state review/approval of the project on June 30, 2024.

The proposed new building will be connected to the Computing and Engineering Building (CEB) to address current facility deficiencies and meet the future needs of the proposed civil engineering academic program. The 82,522 GSF building will accommodate hands-on teaching and research laboratories, lab support facilities, student meeting and study areas, and faculty offices. Additionally, 42,411 GSF of the CEB and nearby Cheney Hall will be modified to support the program.

The initial site proposed for construction is on the south side of CEB, which necessitates the demolition of Cadet Hall and an adjacent parking lot. Built in 1955, Cadet Hall currently houses the ROTC program for the EWU campus, which will be relocated to another facility on campus. EWU will perform an Intensive-level survey and updated Historic Property Inventory Form for Department of Archaeology and Historic Preservation (DAHP) prior to design. Sitework for the project will include providing utilities from a proposed nearby geothermal plant, as well as paving parking areas and landscaping. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Sincerely,

Troy Bester  
Senior Project Manager

## 9.3 PREDESIGN STUDY PROCESS PARTICIPANTS

### EASTERN WASHINGTON UNIVERSITY

#### EWU ENGINEERING DEPARTMENT

David Bowman, Dean, College of Science, Technology, Engineering, and Mathematics

Jennifer Waldo, Associate Dean, College of Science, Technology, Engineering, and Mathematics

#### *2024 Faculty Participants*

Jason Durfee, Department Chair & Professor, MENT, MET Program Coordinator

Richard Orndorff, Professor, Geosciences

Chad Pritchard, Professor, Geosciences

Awlad Hossain, Professor, ME, MET, ME Program Coordinator

Jennifer Leaf, Assistant Professor, ME

Troy Krumrey, Lecturer, Manufacturing/Technology, Construction

Joe Stoutimore, Engineering Technician 2

#### *2020 Faculty Participants*

Martin Weiser, Department Chair & Associate Professor, ME & MET

Terence Geyer, Senior Lecturer, Applied Technology, Technology/Manufacturing

Rusty Hallin, Lecturer, Applied Technology, Technology/Manufacturing

James S. McCuiston, Lecturer, Distance Education & Technology

Donald Richter, Professor, ME, MET & Technology/Manufacturing

Gary Weber, Lecturer, ME & MET

#### EWU FACILITIES AND PLANNING

Kris Jeske, Director, Construction & Planning

Troy Bester, Senior Project Manager

### DESIGN TEAM

#### LMN Architects (Architect)

Jennifer DuHamel

Jennifer Milliron

Rachel Dinkel

Kjell Anderson

Stephen Van Dyck

#### Research Facilities Design (Laboratory Planner)

Terry D. Brown

Jeff R. Schulien

#### Saiful Bouquet (Structural Engineer)

Saiful Islam

YK Low

#### Coughlin Porter Lundeen (Civil Engineer)

Tim Brockway

Ken Wiersema

#### MW Consulting Engineers (Mech/Elec Engineer)

Anthony Schoen

Joel Enevold

Kjersten Khuta

#### Roen Associates (Cost Estimator)

Dan Deymonaz

Jovelyn Limbag

## 9.4 PRELIMINARY LEED CHECKLIST

### LEED

Washington State requires sizable capital projects to achieve a minimum of LEED Silver. Several projects at EWU have achieved LEED Gold.

### LEED v4/v4.1 for BD+C: New Construction and Major Renovation Project Checklist

9.6 PRELIMINARY CONSTRUCTION COST ESTIMATE

**Construction Cost Summary**

Owner: Eastern Washington University  
 Project: EWU Engineering Building

**ESTIMATED COSTS SUMMARY**

June 25, 2024

**Alternative 1 - New Building with CEB Renovation**

| Item   | Description                           | QTY    | UOM  | \$ / UOM      | Cost                 |
|--|---------------------------------------|--------|------|---------------|----------------------|
| 1  | New Engineering Building              | 82,522 | BGSF | \$ 696.60     | \$ 57,484,211        |
| 2  | Existing Building Work - CEB          | 39,281 | BGSF | \$ 315.52     | \$ 12,393,885        |
| 3  | Existing Building Work - Cheney       | 3,130  | BGSF | \$ 231.25     | \$ 723,811           |
| 4  | Sitework                              | 65,000 | SGA  | \$ 69.21      | \$ 4,498,805         |
| 5  | General Conditions & Support Services | 32     | MO   | \$ 115,000.00 | \$ 3,680,000         |
| <b>Total Estimated Construction Cost (Today's Dollars)</b> |                                       |        |      |               | <b>\$ 78,780,712</b> |
| 6  | Escalation to Midpoint (Q4, 2028)     | 18.00% | on   | \$ 78,780,712 | \$ 14,180,528        |
| <b>Total Construction Cost (Escalated)</b>                 |                                       |        |      |               | <b>\$ 92,961,240</b> |

**COMMENTS:**

Design, Bid, Build delivery method is assumed  
 Assumes a Q3, 2027 start and a 32 month schedule  
 No Site Frontage Improvements are included or anticipated.

**Project Owner:** Eastern Washington University  
**Project Name:** EWU Engineering Building  
**Project Location:** Cheney, WA  
**Project Start Date:** Q3, 2027  
**Estimate Date:** June 25, 2024

**Architect:** LMN Architects  
**Project Duration:** 32 MO  
**Building GSF:** 82,522  
**Site GSF:** 65,000

**Project Owner:** Eastern Washington University  
**Project Name:** EWU Engineering Building  
**Project Location:** Cheney, WA  
**Project Start Date:** Q3, 2027  
**Estimate Date:** June 25, 2024

**Architect:** LMN Architects  
**Project Duration:** 32 MO  
**Building GSF:** 3,130  
**Site GSF:** -

## 9.8 OUTLINE SPECIFICATIONS

The following outline specifications form the basis for the Engineering Building construction costs:

### **A Substructure**

#### A10 Foundations

A prior geotechnical report for this project was prepared by AMEC Earth and Environmental Inc. dated October 8, 2001. The geotechnical report recommends shallow foundation system for new Engineering Building. Existing soft clay soils will be over-excavated approximately 2 to 4 feet below bottom of footings and replaced with compacted structural fill to accommodate for the shallow foundation. Compacted fill will likely need to be imported as existing site soil is not considered appropriate due to its long term compressibility. Perched ground water was encountered at depth of 6 to 10 feet below ground surface during the soil exploration.

New column foundation at the vicinity of an existing utility tunnel traversing at the west of the building site will be designed to minimize the surcharge load to the tunnel.

#### A20 Basement

Basement wall will consist of 12" thick concrete wall with continuous wall footing and slab on grade can be 5" thick reinforced concrete slab underlain by properly prepared subgrade. A soil report addendum will be required to provide updated design information per the current building code.

### **B Shell**

#### B10 Substructure

Floor to Floor Height: A height of 18'-0" floor to floor at the ground level and level two is established to accommodate the robust mechanical and electrical equipment serving the 'shop' like laboratories. A height of 16'-0" floor to floor will be used at levels one to align with the floor to floor of CEB for ease of connecting into the existing building.

#### Codes:

The governing building code will be the International Building Code, latest edition with Washington State amendments, WAC 51-50. Other referenced design codes are anticipated to include the AISC Manual of Steel Construction (LRFD), Second Edition, ACI Building Code, Commentary, ACI 318 14, ASCE 7-16 and AWS Structural Welding Code (AWS D 1.1 10).

#### Design Load

- Live Loads:

|   |                        |
|---|------------------------|
| Classrooms, Offices and Interior Spaces | 81 psf, reducible      |
| Lobby, Exterior and Exit Areas          | 100 psf, reducible     |
| Light Storage                           | 125 psf, non-reducible |
| Laboratory and Laboratory Support Area  | 100 psf, reducible     |
| Roof                                    | 20 psf, reducible      |
  
- Dead Loads:
  - General: Estimated weight of construction material.
  - Partitions: 10 psf included in seismic mass per building code requirement; 15 psf minimum for gravity design.
  - Typical ceiling and finishes: 5 psf.
  - Mechanical Equipment: 100 psf or actual weight of mechanical equipment.
  
- Lateral Loads:

Seismic design criteria will be based on ASCE 7-16.

Seismic Design Parameters:

|                                      |   |
|--------------------------------------|---|
| Risk Category                        | III   |
| Seismic Design Category              | D   |
| Design Spectral Response Coefficient | SDS = 0.312                                   |
| Design Spectral Response Coefficient | SD1 = 0.177                                   |
| Importance Factor                    | I = 1.25                                      |
| Structural Response Modification     | R = 8 (Steel Buckling-Restrained Brace Frame) |
| Deflection Amplification Factor      | Cd = 5  |
| Drift Limit                          | 2.0%  |
| Seismic Design Category              | E   |

Wind Design Parameters:

|                        |                    |
|------------------------|--------------------|
| Wind Basic Wind Speed  | 115 miles per hour |
| Wind Exposure          | B                  |
| Wind Importance Factor | I = 1.0            |

Materials

Concrete

- f'c = 5,000 psi (NWC); All columns
- f'c = 5,000 psi (NWC); All beams and slab
- f'c = 5,000 psi (NWC); Basement Walls
- f'c = 4,000 psi (NWC); Column Footings
- f'c = 4,000 psi (NWC); Basement Wall Footings
- f'c = 4,000 psi (NWC); Slab on grade
- f'c = 3,000 psi (LWC); Concrete on Metal Deck

Reinforcing steel

ASTM A615 Grade Steel 60 ksi or 75 ksi except as noted on the drawings.

Structural Steel

- ASTM 992 for all structural shapes except as noted otherwise
- ASTM A500, Grade B for all structural tubes
- A490 Anchor bolts
- A325 High strength bolts, except as noted otherwise

Gravity-Load Resisting System

- Steel construction with concrete filled metal decks supported on steel beams is proposed. The elevated floors and roof diaphragms will consist of 3 ¼" light-weight concrete over 3" metal deck on steel beams and girders, supported by steel columns.

Lateral-Load Resisting System:

Braced Frame above Level 1 and concrete shear walls below are used to provide seismic bracing for the Engineering Building. Buckling Restraint Braced Frames (BRBF) will be used in both directions at the upper floors and evenly distributed throughout the building and strategically located within the stair and shaft walls. BRBF's will transition to concrete shear walls at the Ground Level.

BRBF/Concrete shear wall scheme was selected over others because it offered added values and opportunities that significantly enhanced the project. Benefits of the proposed structural scheme

include:

- Provides a much more sustainable, lighter and a very high-performing structure.
- BRBF/Concrete shear wall are ideal for drift control due to their inherent stiffness. Strategic placement of the braced frames and shear walls adjacent to stair and restroom walls or partition allows total flexibility for space planning.
- The building, as designed, is very stiff and will have significantly less inter-story drift than what the code permits.
- The smaller story drift will limit the building damage in an earthquake event and allow restoration of building functionality and occupancy much more expeditiously than would be possible with other more flexible lateral force resisting systems.
- This is no vertical discontinuity in the braced frames. This not only simplifies the construction but also yields a structure which is much more robust.
- The proposed structural system is very cost-effective and also minimizes the construction time.
- Long-span roof structure over the Metallic Lab can be achieved economically with steel beams.

Penthouse Construction: Construction will be structural steel columns and bracing, and steel roof framing.

### B20 Exterior Enclosure

Exterior Walls:

- The brick wall system will include; an air cavity, rigid insulation, air barrier, sheathing, steel framing, batt insulation, a vapor barrier, and interior drywall.
- Steel framing will support curtain walls and window systems, and metal panel and louvered penthouse enclosure walls.

Exterior Windows, Doors and Louvers:

- Punched aluminum frame windows at laboratories within brick wall system, curtain walls at building entries and laboratory facades parallel to Washington Street and the Art Walk as well as glazed entrance doors will all be aluminum with anodized finish. All glazing will be insulated low-E performance glass.
- Operable vertical panel doors at laboratories to exterior.
- Hollow metal exterior doors and interior doors at mechanical spaces.
- Painted hollow metal doors and frames at mechanical spaces, service entrances, and emergency exits.
- Louvers will be painted aluminum, fixed and drainable.

### B30 Roofing

Roofing materials will include the following: thermoplastic membrane roofing over tapered rigid insulation, roof walkway pads, painted sheet metal coping at parapets, and roof stanchion tie-offs.

## **C Interiors**

### C10 Interiors Construction

Partitions: Typical interior partitions will be metal studs with 5/8" type 'x' gypsum wallboard, impact resistant gypsum wallboard on all corridor walls, and acoustic insulation where required. All demising walls will be built to underside of structure. Fire and smoke stopping will be provided at all rated wall and floor penetrations.

Doors: Interior doors will be of formaldehyde free solid core particle board, or mineral cores at labeled doors, with stained hardwood veneer faces. Doors will have satin stainless steel finish hardware with required accessories. Interior door and reight frames will be of hardwood or

painted hollow metal, with fire rated glass where required.

#### C20 Stairs

The two egress stairs will also serve as the communicating stairs and are located adjacent to the building entries and will have steel structure with architectural detailing including precast concrete treads and perforated metal risers. Doors into egress stair will be design to remain open on hold opens and automatically close in event of fire.

#### C30 Interior Finishes

Floor Finishes: Interior floor finishes will include polished concrete in circulation areas and lobby/work area/ event space paralleling Washington Street, resilient tile in controlled research and Sensor Tech Lab and sealed concrete in all other teaching, project and research laboratories. Additional floor finishes include low VOC carpet tile at collaboration spaces and classrooms, ceramic tile at restrooms, sealed concrete at Tech Offices, support and back of house spaces and a durable traffic coating at the penthouse.

Wall Finishes: Interior wall finishes will include painted gypsum wallboard, ceramic tile at restrooms, acoustic wall panels in classrooms and at circulation, hardwood architectural detailing in the open student study lounge/work area, and corner guards as required. Sections of storefront glazing provide visibility into the teaching, project and research laboratories.

Ceiling Finishes: Interior ceiling finishes include exposed structure, painted gypsum wallboard, suspended acoustical ceiling systems, and wood slat ceiling clouds in public circulation area and collaboration areas.

Interior specialties: See E2015 Non-Laboratory Casework and Other Specialties.

### **D Services**

#### D10 Conveying Systems

One 3 stop MRL passenger and one 4 stop MRL freight elevator with roof access will be provided, with ladders to the elevator pits.

#### D20 Plumbing

D2010 Plumbing Fixtures:

Restroom wall hung water closets, urinals and lavatories will be constructed of commercial grade vitreous china. Lavatory traps and supplies will be insulated per accessibility requirements.

Hands free sensor operated electric faucets with integral thermostatic mixing controls will be provided on toilet room lavatories. Sensor operated electric flush valves will be used for water closets and urinals.

Lab sinks will either be epoxy as part of the casework or stainless steel for chemical resistance or durability. Custodial sinks will be provided with wall faucet and lever handles.

Emergency showers and eyewash stations within the labs/shops, as provided under E10, will be serviced from a new centralized tempered water system that delivers potable tepid water between 60 and 95 degrees to the safety stations.

Laboratory fume hoods, as provided under E10, will be pre-piped with utility connections at the top and rear of hood.

Water Conservation- The following items will be reviewed by the design team and Eastern

Washington University for Water Conservation and Long Term Campus Standardization / Maintenance considerations; dual flush (1.6/1.0 GPF) water closets, ultra-low flow water closets (1.28 GPF), pint flow urinals, and lavatory faucets to deliver 0.5 GPM.

#### D2020 Domestic Water Distribution:

Domestic cold water and 115-120°F hot water distribution systems will be provided throughout the building. The existing water heaters will be modified to service both the new addition and existing building.

A hot water recirculation system controlled through the campus energy management system (EMS) will be provided and distributed at low velocities, using “in-line” all-bronze circulating pumps.

Hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F. The existing water heating system in the basement of the existing building will be modified for expanded program demands.

Valves will be provided at all branch take-offs to individual fixture groups, and zone valves will also be provided. Balancing valves will be placed in return loops at connections of the hot water piping.

#### Materials:

Water Piping: Copper type L

#### D2030 Sanitary Waste System

A gravity sanitary drainage system will be provided to serve all plumbing fixtures and equipment (see also Lab Waste and Vent System under Section D2090).

Floor drains will be provided at safety showers in keeping with campus standards with the exception of metal shops that have the possibility of introducing oil into the sanitary sewer. Oil water separators are not anticipated at this time.

#### Materials:

Drain, Waste, Vent Piping (above grade) : Cast Iron

Waste Piping (below grade): PVC, ABS, or cast Iron

#### D2040 Rainwater Drainage

Gravity primary and overflow storm drainage systems will be provided to serve the roof levels with each system piped separately outside of the building. Rain leaders will be located within the heated portion of the building to prevent freezing of the pipe and will be insulated to prevent condensation from developing on the pipe. Overflow drains will terminate at grade level on splash blocks.

#### Materials:

Storm Drain Piping (above grade): Cast Iron

Storm Drain Piping (below grade): PVC, ABS, Cast Iron

#### D2090 Other Plumbing Systems

Compressed Air System: The existing air compressors are having issues with breakdowns due to age and wear. A new central compressed air system with duplex compressors, air drier and receiver storing 125 psig air will be provided for shop uses. Compressed air will be delivered at

100 psig and be piped throughout the laboratory/shop spaces. Isolated areas that require clean/dry air will have point of use driers and filters and air pressure regulators. The compressors will be located in the new addition to allow space for expanded water heaters in the existing mechanical room.

**Lab Vacuum System:** The existing vacuum pumps are obsolete and do not have available parts. A new vacuum pump and receiver will be provided in the new mechanical room to make room for expanded water utilities in the existing mechanical room. High vacuum needs will be provided from owner furnished, owner installed local pumps.

**Natural Gas System:** Natural gas from the existing building will be extended to the foundry for use in the kilns. Extensive use of natural gas is not anticipated.

**Lab Specialty Gas Systems:** Central house system for nitrogen and specialty gases are not anticipated. If required, these will be Owner provided at the point of use.

**Welding Gas Systems:** Central welding gas systems are not anticipated. Welding gases will be Owner provided from movable welding carts on wheels.

**Industrial Water Systems:** Cold and 115-120°F hot non-potable water distribution systems will be provided throughout the new addition to selected equipment and lab faucets. The systems will be isolated from the domestic water system with a reduced pressure backflow preventer assembly. Hot water heat exchangers and storage tanks will be the same as described in Section D2020 and will be located within the existing mechanical room.

**Industrial Hot Water Recirculation System:** A recirculation system will be provided and distributed at low velocities to ensure fixtures and equipment requiring hot water will have hot water readily available through the use of "in-line" all-bronze circulating pumps.

**Tempered Water System:** Potable cold water will be tempered by mixing domestic cold water and domestic hot water at a new master mixing valve located in the existing mechanical room to deliver tempered water to the emergency showers and eyewash stations throughout the building.

**Lab Waste and Lab Vent System:** Laboratory sinks in casework, chemical fume hood cup sinks and floor drains in chemical use areas will be piped in a dedicated waste system that will allow for future monitoring by regulatory authorities for possible discharges. Outside the building, after the monitoring point, the lab waste system will combine with the building sanitary sewer. Waste and vent piping will be chemical resistant.

**Snow Melt System:** A hydronic snowmelt system will be provided for exterior walkways at main entrances and site stairs that are difficult to access with mechanical snow removal equipment. Hydronic heat for the snowmelt system will be generated from a water-to-water heat exchanger connected to the new additions hot water heating system.

#### Materials:

Compressed Air Piping: Copper

Lab Air Piping: Copper

Lab Vacuum Piping: Copper

Lab Natural Gas Piping: Black steel

Industrial Hot/Cold Water/Tempered Water Piping: Copper

Lab Waste Piping: Polypropylene

Snowmelt Piping (buried in slab): Polypropylene

### D30 HVAC Systems- General

**Campus Chilled Water Plant:** The campus has a central chilled water plant that distributes chilled water to the buildings on campus through an underground tunnel system. The new open-source geothermal plant will be connected to the existing campus chilled water piping network, providing an ultra-high efficiency first stage of cooling and an opportunity to trade energy between this project and all other buildings on campus currently connected to the campus chilled water system, improving the overall campus energy efficiency. The new addition basement mechanical room is in close proximity to the campus tunnel and the tunnel will be extended to connect to the basement mechanical room with a 6" service for the new addition.

**Campus Steam Plant:** The campus has a central steam plant that distributes steam and condensate to the buildings on campus through an underground tunnel system. The new addition basement mechanical room is in close proximity to the campus tunnel and the tunnel will be extended to connect to the basement mechanical room with a 4" high pressure steam service for the new addition.

**Heating System:** Primary heating will be provided from campus low temperature heating water (120°F) supplied by the new open-source geothermal heating plant. Low temperature heating water (LTHW) will be routed to this building via 6"Ø supply and return pipes. The LTHW will then be distributed through the building via fully redundant building heating water pumps. Glycol hot water solution will be piped to the air handlers, hydronic heating systems, and snow melt heat exchangers. Since the nature of the new addition is primarily heating and cooled with 100% outside air ventilation systems, radiant heating should be provided for off-hour heating requirements.

**Ventilation Requirements:** It is anticipated that the lab/shop spaces in the new addition will be 100% outside air systems with heat recovery where air quality is suitable for passing through filters and equipment. Six (6) labs with fume hoods should be located in close proximity to be zoned from the same air handling unit if practical, so that they can be efficiently ventilated 24 hours a day (minimum 6 air changes per hour in the occupied mode and 4 air changes per hour in the unoccupied mode).

**Acoustic Considerations:** Vibration isolation of pumps and compressors will be provided. Additional acoustic considerations will include limiting duct velocities through ductwork, terminal units and air inlets/outlets to achieve space NC, use of sound attenuators in the duct systems, and vibration isolation of mechanical equipment with spring isolators and flexible connections will also be employed.

**Outdoor Design Conditions:** Heating Systems will be sized for the ASHRAE median of extremes for Cheney, Washington which is -9°F. Cooling systems will be sized for the ASHRAE 0.1% design condition temperature for Cheney, Washington which is 99°F dry bulb and 69°F wet bulb.

#### **Indoor Design Conditions:**

When occupied, office and lab spaces will be maintained between 68 and 75°F.

Telecommunication rooms will control to 68-75°F 24 hours per day, 7 days per week. Mechanical and electrical spaces will control to 55-85°F.

### D3010 Energy Supply

Electrical service to the EWU Campus primary distribution system is provided by the City of Cheney.

Campus low temperature heating water and chilled water will be delivered from the GeoEco Plant. The GeoEco Plant will provide all-electric heating and cooling to the building utilizing a ground source heat pump. This new GeoEco Plant will provide higher efficiency chilled water to the building that the existing chilled water plant, and will allow energy trading between all buildings on campus that are currently connected to the existing chilled water distribution system.

Steam will be provided for laboratory steam sterilizers.

#### D3040 HVAC Distribution

**New Addition Supply:** The new addition lab/shop areas will be serviced from 100% outside air systems with heat recovery and perimeter heat (estimated at 80-85,000 cfm). Units will have supply fans, hot water heating coils, chilled water coils and filters with VAV controls and multiple fans installed in an array for redundancy. Each zone will have its own air terminal unit for regulation of airflow based upon occupied/unoccupied airflows and temperature requirements. The non-lab core spaces will be serviced from high efficiency VAV systems (estimated at 32,000 cfm) although alternative systems such as DOAS system with chilled beam terminal units should be evaluated in the design phase.

**New Addition Exhaust:** Exhaust will be ducted to exhaust fans with heat recovery at the roof level. Fans will be manifolded for partial redundancy and spaces will have pressure independent exhaust terminal units. Specialty exhaust for products of combustion such as foundry furnaces/kilns will be ducted separately out the building without heat recovery. Air will be filtered at grilles prior to entering the exhaust air terminal units of each space. Exhaust systems are anticipated to be 70-75,000 cfm.

#### **Renovation:**

Ground Floor:

Due to reconfiguration of this zone, all mechanical upgrades in this area should be considered Heavy Renovation

**Additive manufacturing:** This zone is serviced by a 22,000 cfm AHU which has 100% outside air and 100% exhaust capabilities, has too much air volume and is too energy intensive for the new proposed use. This scope should replace or rebuild existing AHU-5 and associated relief/exhaust fan to provide capacity in the 5-7,500 cfm range. Due to the industrial use of former metallics lab all ductwork in this zone should be removed and replaced with new.

**Teams room, storage, and student lounge:** Remove existing ductwork and exhaust fans including wood working exhaust systems. Provide new hot and cold duct VAV mains from existing AHU-1 in the north ground floor mechanical room and new dual duct VAV terminal units for these spaces.

**Material Science Lab, CE Construction Materials, and shared Research:** AHU-4 (10,000 cfm with 100% outside air capability) and a VFD controlled relief fan currently feeds the wood shop. Extend AHU-4 ductwork to service this zone. Provide supply and exhaust terminal units for each zone with hot water reheat from the new addition. Provide VAV controls on the supply fan. Retrofit or provide new exhaust fan for increased exhaust duct static pressure.

The existing dust collectors will not be required for the new scope and should be removed as they have had several breakdowns and should not be considered reliable for continued long term use for the expanded woodworking/construction shop areas.

Second Floor

This floor should be considered light tenant improvement work for HVAC systems and moderate

plumbing renovations in the expanded thermodynamics lab and shared research which is nearly doubling in size.

This floor is serviced by dual duct VAV air handling systems. Provide new VAV terminal units and new branch ductwork to accommodate new zoning. Modify plumbing as required for new use.

#### Third Floor

This floor should be considered light tenant improvement work for HVAC and plumbing systems.

This floor is serviced by dual duct VAV air handling systems. Provide new VAV terminal units and new branch ductwork to accommodate new zoning. Modify plumbing as required for new use. Potential scope in this zone could include relocation or removal of a sink in the existing kitchen area and potential relocation of vent pipes in walls.

Dust Collector: A dust collection system will be provided for the wood shop. The dust collector will be located on the south side of the new addition outside the shop area with access for dustbin service. Air will be filtered with final filters and recirculated back to the space for energy conservation.

Process Exhaust: Provide exhaust for point source particulates. Consider filtration units for welding that clean the air prior to recirculating back to the space.

Supply/return and non fume hood exhaust ductwork: Galvanized steel

Chemical fume hood exhaust ductwork: Stainless steel although galvanized will be considered for manifolded systems diluted with general exhaust.

#### D3050 Terminal and Packaged Units

Areas that have 24-hour process cooling loads such as the main telecommunication rooms will be serviced from dedicated standalone cooling units.

#### D3060 HVAC Instrumentation and Controls

Direct Digital Control (DDC): The project will utilize a Direct Digital Control (DDC) for the control of the HVAC systems, providing for heating and cooling control, peak load demand limiting and start/stop optimization. Damper and valve actuators will be electronic. Room thermostats will be an electronic adjustable type with override switch for occupant activation to occupied mode during unoccupied periods.

Energy Management System (EMS): The EMS controls will be compatible with EWU's campus BACnet system and existing computing and engineering facility controls manufactured by Alerton. Controls will interface and communicate with this network and front-end operator's terminal for the purpose of remote operation and maintenance. The EMS will include display and report real-time building systems performance data. The EMC controls will provide energy metering interface for the new and existing water, chilled water, low temperature heating water, steam and electric utilities servicing the existing building and new addition to a Skyspark control system.

Within the existing facility, the scope will include an upgrade of the Global Building Controller for compatibility with the new facility software. Existing supply and exhaust VAV will also be considered for controls upgrade due to cleaning issues associated with airflow measurement and improved airflow accuracy with new controllers for building pressurization.

Chemical Fume Hood Controls: Variable air volume controls shall be considered for the hoods for

acoustics and energy conservation.

#### D3070 Testing, Adjusting and Balancing

Air systems (supply, return, and exhaust), hydronic, and domestic hot water recirculation systems will be completely balanced in accordance with Associated Air Balance Council or National Environmental Balancing Bureau.

#### D40 Fire Protection

General System: The existing system will be extended from the existing building to the new addition and the addition will be sprinklered in accordance with the City of Cheney requirements.

Sprinklers: The building light hazard areas (office, lecture rooms, circulation spaces) will be sprinklered to light hazard requirements. Electrical, mechanical and non-chemical use labs will be sprinklered to ordinary hazard group 1 requirements. Labs, shops, and other higher hazard areas will be sprinklered to ordinary hazard group 2 requirements. The fire system will be divided into multiple zones by floor for identification and annunciation at the central fire alarm panel.

Standpipe: A fire protection standpipe will be required and provided at each exit stairwell if the highest occupied level of the building exceeds 30 feet above grade.

#### D50 Electrical Systems General

The building electrical systems will be designed in accordance with the latest revised edition of the following codes:

##### National Electrical Code

- International Building Code (IBC)
- International Fire Code (IFC)
- Regulations of the State Fire Marshal
- Electrical Safety Order of the Washington State Department of Labor and Industries
- Washington Administrative Code
- Americans with Disabilities Act (ADA)
- Washington State Non Residential Energy Code
- Requirements of Washington State Industrial Safety & Health Administration (WISHA)

The building electrical systems will be designed in accordance with the following standards:

- Illuminating Engineers Society of North America (IESNA)
- Eastern Washington University Construction Standards

#### D5010 Service and Distribution

Site Electrical: The existing building receives power from the existing campus 13.2KV primary electrical distribution system via existing 13.2KV Switch #1. As part of the proposed building addition, a new building service will be established at the new back of house service area. The existing service will be removed and re-fed from the new service to allow for a new building main entry from the West. The existing 13.2KV Switch #1 is loop fed from the campus primary electrical distribution system and is suitable for new service work.

Temporary Site Electrical: The existing building service transformers, generator and propane tank will require temporary relocation prior to the start of building excavation. It is proposed that this equipment be relocated North and adjacent to the existing parking lot to be outside of the excavation for the new building ground floor. This relocation will allow the existing building to remain in service during the construction of the new building. Once the new building permanent services are established, the existing building temporary services will be replaced with new

services from the new construction. The existing building telecom services from the existing tunnel are not expected to be impacted by the construction of the new building.

**Building Normal Electrical Service:** (3) new three-phase four-wire electrical services will be provided for the new building. These new electrical services will be derived from (1) new 480/277V outdoor pad mount transformer and (2) new 208/120V outdoor pad mount transformers, which will be connected to the EWU campus 13.2KV primary electrical distribution system. (2) new main switchboards will be located in a dedicated main electrical room located on the ground level. The dedicated main electrical room will be located as closely as possible to the new outdoor pad mount transformers to limit the secondary service cable length. The existing building 480V & 208V main switchboards will be refeed from the new services. The new 480V main switchboard will refeed the existing building 480V switchboard. The existing and new 208V main switchboards will each be served by a dedicated 208V service transformer.

**NEC Article 700 Emergency Electrical Distribution System:** The emergency electrical distribution system will consist of (1) 150KW, 480/277V engine driven natural gas fueled generator. The emergency electrical distribution system will be provided with an automatic transfer switch in order to automatically switch loads between the normal EWU campus power and generator backed power. The emergency electrical distribution system will supply power to all life safety systems within the building such as egress lighting, exit lighting and the fire alarm system.

**NEC Article 702 Optional Standby Electrical Distribution System:** The standby electrical distribution system will consist of (1) existing 125KW, 480/277V engine driven propane fueled generator, which will be relocated from the existing building service yard. The standby electrical distribution system will be provided with an automatic transfer switch in order to automatically switch loads between the normal EWU campus power and generator backed power. The primary intent of the standby power system is to provide generator backed power to non-life safety loads within the new building, such as fume hoods, department computer servers, telecommunications rooms (and associated cooling) and important lab equipment which is deemed critical by EWU staff.

**Building Distribution:** The building electrical distribution will originate from a main electrical room on the ground floor and feed smaller stacked electrical rooms located on each floor above. The building electrical distribution will be designed to provide separation of lighting, mechanical and computer equipment loads. Lab and special equipment power distribution will be separate from general building power panels. Because the building is being provided with separate 480/277 and 208/120V electrical services, it will not be necessary to distribute dry type step down transformers throughout the building. Multi- stage surge suppression shall be provided by installing transient voltage surge suppressors at the main switchboard, distribution switchboards and appropriate panelboard locations.

**Electric Metering:** Owner metering shall be provided for the building main electrical service equipment. Additional sub meters shall be provided for lighting, mechanical, PV system, EV charging and plug loads to allow separate metering for each end use type.

**Switchboards:** Switchboards shall be free-standing dead-front style. Main devices shall be equipped with ground fault protection. Distribution devices shall be factory-installed, group-mounted circuit breakers. Each main switchboard will have owner metering per EWU campus standards and integral TVSS protection. Switchboard shall be mounted on a 2" concrete housekeeping curb. All bus bars shall be copper.

**Panelboards:** Circuit breaker panelboards shall be provided throughout the building as required to adequately serve the associated building loads. Lab spaces will typically receive dedicated

power panels located within each lab room. Panelboards shall be dead-front circuit breaker type with proper interrupting capacity. All panelboards shall be provided with 42 available circuits and door in door construction. All bus bars shall be copper. Where appropriate, panelboards will be provided with integrally mounted TVSS units.

**Mechanical Equipment:** Refer to mechanical narrative for proposed mechanical systems and possible equipment. Motor loads ½ HP and larger will be 480V three phase. Motor starters and disconnects will typically be located in close proximity to each associated piece of mechanical equipment. Variable frequency drives will be provided by the mechanical contractor and installed by electrical contractor for various pieces of mechanical equipment.

**Shop/Lab Equipment:** Refer to the lab narrative for proposed electrical systems to be provided for each unique space. The electrical systems will be designed to provide ultimate flexibility to accommodate the ever-changing program needs for engineering studies.

**Disconnect Switches:** Safety switches shall be heavy duty type with interlocking door and spring-loaded contacts. Safety switches used as motor disconnects shall be fused. Outdoor safety switches shall be NEMA 3R.

**Engine/Generator:** Emergency and standby power generation shall be provided by means of an engine driven or natural gas fueled generator set. Each generator set shall be sized to supply the emergency and standby loads served. Emergency power will not be provided for elevator operation. Generator sets shall include a weatherproof sound attenuating enclosure for outdoor installation. Operation of the generators will be monitored on a multi function system designed to report most normal failures such as low cooling fluid temperature, low starting batteries, overcrank, overload, high water temperature, etc. The generators shall be mounted on a 6" curb to allow for maintenance access to oil drain low point.

**Automatic Transfer Switch:** The automatic transfer switches shall be 4-pole, switched neutral, open transition type.

**Medium Voltage Pad Mount Transformers:** Transformers shall contain a dead front loop feed primary compartment. Provide transformers with integral secondary disconnect switch located within the transformer secondary compartment. Provide external oil sampling valve system extended to lockable box on exterior of each transformer.

**Medium Voltage Cabling:** 15KV medium voltage cables shall be shielded, copper MV-90 single conductors. 15KV cables shall be sized in accordance with EWU campus standards and the National Electric Code and shall be installed with a 600V insulated equipment grounding conductor. 15KV cables shall be installed in continuous runs without splices.

**Medium Voltage Elbows:** 15KV medium voltage cables shall be terminated at transformers by 200 amp rated load-break elbows manufactured by Cooper.

**Grounding:** Grounding materials shall be copper, except ground rods shall be copper-clad steel. Grounding electrode shall be provided per code requirements. Equipment grounding conductors shall be run with all feeders and branch circuits. Separate grounding conductors shall be provided for isolated ground branch circuits. Equipment ground bars shall be provided within all electrical rooms and telecommunications rooms.

**On-site Renewable Energy:** A complete system of photovoltaic arrays shall be provided for on-site renewable energy generation in compliance with the Washington State Energy Code (WSEC). The

minimum system output shall be .5 watts per square foot of new building area. Potential location for solar arrays include the building roof.

#### D5020 Lighting and Branch Wiring

General Interior Lighting: Lighting throughout the interior building spaces will respond to the primary use of each space while maintaining a level of flexibility to react to future use of each space. Uniform ambient lighting will establish a basic minimum lighting level throughout each individual space with task, display and accent lighting used to establish contrast and interest. Specific attention will be given to the lighting for areas with computer workstations in order to minimize glare. Lighting within the building will be LED. Lighting system design foot candle levels will be in accordance with IES standards and EWU standards. In general, areas within the building will be illuminated to the following light levels:

| Building Area      | Foot-Candles |
|--------------------|--------------|
| General Classrooms | 30-50        |
| Labs               | 60-75        |
| Offices            | 30-50        |
| Conference Rooms   | 30-50        |
| Restrooms          | 10-15        |
| Corridors          | 10-15        |
| MEP Utility        | 10-20        |
| Storage Rooms      | 10-20        |

Egress & Exit Lighting: Exit lighting will be LED type. Emergency egress lighting will be provided throughout the path of egress and will be supplied with power from the emergency generator system in the event of a failure on the normal power system.

General Lighting Controls: Within normally occupied spaces, multi-level switching or dimming will be provided in conjunction with occupancy sensors and will utilize two or more manual wall switches. Manually dimmable lighting controls shall be utilized within appropriate areas, such as conference rooms and labs. Automatic dimming controls shall be considered for the purpose of daylight harvesting within areas where adequate natural daylight is present within the building. A programmable low voltage lighting control system shall be provided for automatic control of lighting in corridors / common areas and exterior site lighting. The low voltage lighting control system shall also be interfaced to the campus energy management system (EMS) to all EMS control of the exterior lighting.

Programmable Low Voltage Lighting Control System: Provide a distributed low voltage lighting control system with building management system interface. The low voltage lighting control system shall be manufactured by nLight (acuity brands) in accordance with EWU campus standards.

Occupancy Sensors: Occupancy sensors will be utilized to automatically shut off the lighting within offices, conference rooms, restrooms, labs and classrooms when these spaces are unoccupied. Occupancy sensors shall be dual technology type and capable of vacancy mode. Either ceiling mounted or wall mounted occupancy sensors will be utilized depending on the physical size and specific geometry of the room being controlled.

Sustainable Design Considerations: All sustainable design measures considered will be evaluated completely with regards to their associated sustainable and economic aspects. Many opportunities are currently available to construct a building that is a model of sustainable design.

The following is a brief list of items related to the building lighting and lighting control systems which are being considered for this project:

Energy efficient LED lighting will be utilized as the primary light source within the building in order to reduce the energy consumption associated with the lighting system.

Occupancy sensors will be utilized to automatically shut off the lighting within interior spaces when they are unoccupied. This will allow the interior lighting within these areas to be automatically turned off during unoccupied times, thereby increasing the available energy savings associated with the interior lighting system.

Within normally occupied spaces, multi-level switching or manual dimming will be provided in conjunction with occupancy sensors and will utilize two or more manual wall switches. The utilization of manual controls within these spaces will allow the user to reduce the light levels within their spaces if desired, further increasing the available energy savings associated with the interior lighting system.

Automatic dimming lighting controls will be considered for the purpose of daylight harvesting within areas where adequate natural daylight is present within the building. The utilization of automatic dimming and daylight harvesting will allow EWU to take advantage of the natural available daylight to the fullest extent possible. This will result in additional available energy savings associated with the interior lighting system.

A programmable low voltage lighting control system shall be used to control both the exterior and interior lighting systems. This will allow both the interior and exterior lighting systems to be automatically turned on/off at pre-programmed times, thereby increasing the available energy savings associated with the interior and exterior lighting systems.

General Exterior Lighting: Exterior lighting will be LED type selected to match the architectural building exterior and EWU campus standards. Exterior entry lighting which illuminates the path of egress will be supplied with power from the emergency generator system in the event of a failure on the normal power system. Exterior lighting will utilize full cut off light fixtures in order to avoid light trespass and meet associated dark sky lighting requirements. In general, exterior areas will be illuminated to the following light levels:

| Exterior Area     | Foot-Candles |
|-------------------|--------------|
| Exterior Entry    | 5            |
| Exterior Walkways | 2            |
| Parking Areas     | 1            |

Exterior Lighting Controls: A programmable low voltage lighting control system shall be used to control the exterior lighting. This will allow the exterior lighting to be automatically turned on and off at pre-programmed times, automatically controlled via outdoor photocell and automatically controlled by the campus EMS system.

General Branch Wiring: Provide complete raceway and wiring systems in conformance with code requirements and campus standards.

Conduit: Galvanized steel metal conduit shall be used inside building. Non-metallic conduit shall be used underground, except at transitions. Metal conduit shall be rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or flexible metal conduit. Non-metallic conduit shall be schedule 40 PVC. Conduit shall be concealed wherever possible. Minimum

conduit size is 3/4" unless otherwise noted. Conduits installed within utility tunnels shall be rigid metal conduit.

**Building Wire:** All wiring shall be copper, minimum size #12 AWG. All feeder conductors shall be installed in conduit. Aluminum conductors are not allowed on the EWU campus, unless approved by the project manager. All 480/277V and 208/120V building wire shall be color coded in accordance with EWU campus standards.

**Wiring Devices:** Switches and receptacles outlets shall be specification grade. GFI type outlets shall be provided where outlets are mounted within 6 feet of a sink. Trim plates shall be color coordinated with architect.

**Electric Vehicle Charging:** Where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

**Renovation:** (refer to architectural narrative for areas of work)

- Ground Floor – Heavy electrical work is anticipated at the ground floor of the existing building to accommodate the new programs. This would include modified electrical distribution, branch circuits, lighting, telecom, fire alarm and security.
- First Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.
- Second Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.
- Third Floor – Moderate to light electrical work is anticipated on the first floor of the existing building to accommodate the new program. This would include modified branch circuits, lighting, telecom, fire alarm and security.

#### D5030 Communication and Security

**Telecommunications Building Distribution:** A complete telecommunications distribution pathway and cabling system will be provided by the contractor in accordance with the EWU construction standards. Pathways, cabling, outlets and passive equipment will be provided by the contractor. Active equipment will be provided by EWU. Telecommunications rooms will be located throughout the facility in accordance with EIA/TIA 568 and 569. The main telecom room will be located on the ground floor of the building, in a centralized location. Secondary communication rooms are to be located on each floor and stacked above the main telecommunication room. Horizontal station cable pathways will be provided and routed to the telecommunications rooms located on each floor. Each telecommunications room shall be provided with a dedicated 120/208V standby power panelboard and an equipment ground bar. Selected areas will be equipped with cabling provisions for owner furnished wireless local area networking. Telecommunications riser cabling and pathways will be provided from the entrance location to the telecommunications room on each floor. Cable trays will be installed down corridors with conduits provided at hard (inaccessible) ceilings and where wall and floor penetrations are required.

**Telecommunication Outlet Distribution:** Telecommunications devices will typically be located at instructor's podiums, ceiling mounted projector locations, computer workstations and required

student locations. Offices shall typically be provided with two telecommunication outlet locations per room. Typically, each outlet will be served with two Category 6 cables.

WiFi Systems: WiFi system pathways, cabling and outlets will be provided by the contractor. Required locations for WiFi network routers will be closely coordinated with EWU. All WiFi network routers will be provided and installed by EWU.

Closed Circuit Television (CCTV) System: New CCTV System pathways and network drops will be provided by the contractor. Required locations for CCTV devices will be closely coordinated with EWU. All CCTV cameras, power supplies, cabling and active electronic equipment will be provided by EWU and installed by the contractor.

Access Control System: A complete electronic access control system will be provided for the new building. Required locations for miscellaneous access control devices will be closely coordinated with EWU. Typical spaces which will include access controls are classrooms, labs, office suites and utility rooms.

#### D5090 Other Electrical Systems

Audio / Video Systems: Audio visual systems will be provided and installed by the contractor. Spaces requiring audio visual system shall include, but not be limited to assembly spaces, classrooms and meeting rooms. The basis of design for assembly spaces and classrooms shall be a hybrid learning classroom which will include projectors, projector screens, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, lecture capture camera and device inputs. Large meeting rooms will require a projector and screen or wall mounted display, reinforced sound and control systems. Small and medium size meeting rooms will require wall mounted display and media control systems. Computer labs will be treated as basic classrooms with either projectors and screen or wall mounted displays, overhead ceiling speakers, wireless microphone systems, assistive listening devices, room control, and wireless device connectivity.

Fire Alarm: A complete battery backed addressable fire alarm system with manual pull stations, automatic detection and ADA compliant horn/strobes will be provided throughout the facility. Smoke detector and heat detectors will be installed as required by the governing codes, and in accordance with EWU campus standards. The building fire sprinkler system will be monitored by the fire alarm system for system flow and shutoff valve tampering. Central reporting capabilities will be provided with the fire alarm system and shall be compatible with the existing campus fire alarm monitoring system. The new fire alarm system shall be manufactured by Edwards System Technology (EST) in accordance with EWU campus standards.

Clock System: Clock System pathways, cabling and outlets will be provided by the contractor. Required locations for clocks will be closely coordinated with EWU. All clocks and clock equipment will be provided and installed by EWU.

Room Scheduling: Room Scheduling System pathways, cabling, outlets and passive equipment will be provided by the contractor. Required locations for room scheduling will be closely coordinated with EWU. All room scheduling displays, and active equipment will be provided/installed by EWU.

Distributed Antenna System (DAS): A complete distributed antenna system for emergency responder radio use is not planned for the new building. The contractor shall provide building infrastructure for a future DAS system. Upon completion of the building structure, walls and ceilings the contractor shall provide testing for responder radio coverage.

## **E Equipment and Furnishings**

### **E10 Equipment**

#### E1010 Laboratory Fume Hoods and Other Air Containment Units

Bench-Mounted Chemical Fume Hoods: Restricted bypass type / variable air volume (VAV) extraction hoods at 100 fpm (0.51 m/s) face velocity with a vertical rising sash will be provided. Exhaust air volume will be based on 18" open sash position. Fume hood work surface will be dished epoxy resin.

Fume Extractor Arms (Snorkels): Snorkels will be 3 inch (75 mm) diameter, hinged, self-supporting air extractor arm assembly with 14" diameter clear acrylic hood.

Low Slot Exhaust: These will be custom fabricated stainless steel.

Biological Safety Cabinets: Cabinets will be Class II, Type A2, and designed to operate with an intake air velocity of 100 fpm (0.5 m/s), re-circulating the air through the supply HEPA filter into the work area.

Laminar Flow Hoods: Laminar Flow Hoods shall be equipped with supply HEPA filter and reusable prefilter to maintain Class 100 standard at work area.

Canopy Hood: Canopy Hood shall be an exhausted stainless steel canopy enclosure with all hangers and miscellaneous hardware, including damp location light fixture.

#### E1020 Laboratory Service Fittings and Fixtures

Service Fittings: Service fittings shall be chromium plated with an acid- and solvent-resistant, clear epoxy coat finish specifically designed for laboratory use. All service fittings shall be of the tapered body design with four arm handles, except for ADA accessible fittings which shall have lever handles as described below.

Fittings and fixtures: These are designated to be accessible to persons with disabilities (ADA) with operable parts shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate operable parts shall be 5 pounds (22.2 N), maximum.

Safety Stations: Safety station shall be barrier-free with emergency shower actuation valve in stainless steel cabinet for recess mounting and wall-mounted eyewash with stainless steel skirt.

Hand held eye wash: These shall be dual-purpose eye wash/drench hose, deck mounted.

Cup Sinks: Cup sinks will be epoxy and set flush with work surface, except for any cup sinks at fume hoods which will have ¼" raised rim.

Laboratory Sinks: Laboratory sinks will be epoxy for drop-in installation in work surfaces.

Stainless steel sinks: Stainless steel sinks will be Integral one piece construction with stainless steel work surface. 18 gauge (1.3 mm thick) steel unless otherwise noted.

Scrub-up sink: These shall be wall mounted 14 gauge (2.0 mm thick) Type 304 stainless steel sink with knee action control and HWCW mixing valve.

#### E1030 Laboratory Sterilizers And Washers

Laboratory Glassware Washers (as required): These shall be tall, floor mounted, front loading single door units programmable for multiple wash cycle and drying cycle duration, with purified

water rinse capability. Unit shall have mounting hardware and finish pieces for mounting through architectural wall.

Laboratory Medium Steam Sterilizers: These shall be prevacuum/gravity models with interior chamber dimensions of 20: x 36" x 48". Steam source should be provided to operate all sterilizers and Cage/Bottle Washer. Freestanding single door unit shall be cabinet enclosed. Recessed single door unit shall have mounting hardware and finish pieces for mounting through architectural wall. Pass-through double door unit shall have mounting hardware and finish pieces for mounting one end through an architectural wall.

Instruments, Controls Major Electrical Components: These shall be located in surface mount control console. Provide LCD color touchscreen microprocessor based temperature and humidity (where applicable) controller with real-time and archive trending. Each room shall be provided with reset type personnel emergency alarm with electrically powered audible and visual alarm system.

Environmental conditioning system consisting of blower(s), evaporator coil(s), heaters, humidifier (as required), refrigeration piping system and drain pans, shall be housed in modular enclosure(s) suspended from the room ceiling and shall be factory prewired to the control cabinet.

Refrigerant: Utilize non-ozone depleting refrigerants R-134a, R-404A, or approved equal; CFC type refrigerant shall not be acceptable.

Operation: Each system shall be designed and furnished in such a manner as to allow the motor compressor to operate continuously with a modulating bypass system to maintain specified temperature ranges.

Defrost: System shall incorporate an automatic defrost system.

Refrigerant Piping: All refrigeration piping required shall be furnished and installed by the controlled temperature room contractor. Provide ACR type, hard drawn, cleaned and capped Type L copper tubing with silver brazed joints.

Ventilation: provide make-up air from the laboratory space at the rate of 0.25 CFM per square foot (4.57 m<sup>3</sup>/h per square meter) unless otherwise indicated on the drawings. No ventilation air provisions shall be made for freezer rooms operating at or below 0°C.

## **E20 Furnishings**

### E2010 Laboratory Casework and Other Furnishings

Wood Casework: Wood casework shall comply with all requirements of AWI Section 400 Custom Grade architectural cabinets. Lumber shall be plain sawn oak; veneer shall be plain sliced oak. Wood casework shall be flush overlay design.

Metal Casework: Metal casework shall be of modern design and shall be constructed in accordance with the recommended practices of the Scientific Equipment and Furniture Association. All units shall be of flush overlay construction. Door and drawer heads shall be of welded, double walled steel construction, 3/4" (18 mm) thick, filled with sound deadening material.

Corrosive Storage Cabinets: Cabinets shall be vented with corrosion resistant liner designed and labeled specifically for the storage of acids and other corrosive substances, to meet code requirements

Flammable Liquid/Solvent Storage Cabinets: Cabinets shall be metal designed and labeled specifically for the storage of flammable liquids and other volatile substances, to meet code requirements.

Ventilated Storage Cabinets shall have perforated metal adjustable shelving, vent louvers inset on the lower portion of the door, and a 2" diameter PVC connection to the building exhaust system.

Laboratory work surfaces: These shall be 1" thick chemically resistant modified epoxy resin.

Stainless steel work surfaces: These shall be 16 gauge (1.6 mm thick), type 304, #4 finish with heavy mastic coating underside and perimeter timber fixing frame.

Adjustable reagent shelves: These shall be ¾ inch thick, 7-ply shop sanded exterior grade veneer plywood shelving with K+ face veneers with chemical resistant plastic laminate on all surfaces on book-end brackets mounted on double-slotted 2 inch x 2 inch fully welded square steel tube support frame. All shelves shall have 1-1/2" high safety edging.

Adjustable wall shelves: These shall be ¾ inch thick, 7-ply shop sanded exterior grade veneer plywood shelving with K+ face veneers with chemical resistant plastic laminate on all surfaces on book-end brackets mounted on double-slotted standards. All shelves shall have 1-1/2" high safety edging.

Heavy-duty shelving: These shall be 1 inch thick, 7-ply hardwood plywood with chemical resistant plastic laminate on all surfaces and edges on heavy-duty shelf standards and brackets. All shelves shall have 1-1/2" high safety edging.

Stainless steel shelving: These shall be Super Erecta stainless steel shelf system, post supported, floor mounted or wall mounted, and floor mounted high density configuration, and shall include all accessories required for function.

Open industrial metal shelf units: These shall be premium grade 20 gauge steel shelf units comprised of 5 shelves adjustable on 1" increments, 85" high 14 gauge angle post supports, and side and rear cross-bracing.

Cylinder Restraints: These shall be fabricated with Unistrut, Powerstrut or equal.

Overhead service carriers: These shall be fabricated with unistrut channels supported from structure above at 48" on center maximum and include a 14 gauge metal channel at bottom for mounting of piped services and electrical raceways.

Suspended metal channel grid: Purpose designed to support 200 lb. (0.89 kN) point load at any position and 50 lb./ft. (0.73 kN/m) uniformly distributed load. All brackets, channels, etc. (galvanized metal).

Pipe drop enclosures: These shall be an 18 gauge galvanized steel sheet enclosure with removable cover panels and epoxy paint finish.

Drying racks: These shall have a stainless steel body with white polypropylene pegs and integral drain trough with welded stainless steel trough ends.

#### E2015 Non-Laboratory Casework and Other Specialties

Casework: Typical casework provided in the student lounge and tech offices will consist of plastic laminate millwork cabinets, countertops and shelving. Fixed plastic laminate tables will be provided at the Large and Medium Classrooms.

Visual Display Boards: Tack boards and glass marker boards will be provided in classrooms and collaboration spaces.

Toilet Compartments: Provide solid phenolic core partitions that are floor-to-ceiling mount.

Window Blinds: Roller blind window coverings will be provided throughout the building, with blackout shades at labs and classrooms having video projection.

Projections Screens: Provide roll down projection screens.

Signage: Interior way-finding and room identification signage, and exterior building signage will be provided.

Bicycle Racks: Stainless steel bicycle racks will be provided.

Fire Extinguisher Cabinets: Provide recessed stainless steel fire extinguisher cabinets.

Toilet Accessories: Provide stainless steel toilet accessories.

## **F Other building construction**

No requirements.

## **G Site work**

### **G10 Site Preparation**

#### Site Preparation and Excavation

Existing Cadet Hall will be demolished for the construction of the new Engineering Building addition. Cadet Hall has an approximately 5,000-sf footprint and is two floors. Demolition will include removal of all building and foundations, capping of utility services and disposal of all materials to appropriate and legal locations.

Site preparation for the Engineering Building Addition will include removal of the existing paving and miscellaneous site features in the work area.

The topsoil and vegetative material will be removed, screened and saved for re-use in revised landscaped areas. The subgrade will be prepared prior to placing structural fill or building foundations, per future geotechnical recommendations. Structural fill will be approved imported material. Native silty or clayey material is not be acceptable for use as structural fill and will be hauled off site.

#### Temporary Sediment and Erosion Control

During construction, all temporary erosion and sedimentation control systems will be designed and constructed in accordance with the Eastern Washington Regional Stormwater Manual Best Management Practices (BMP's), to protect of site properties as well as minimize the quantity of sediment-laden water from entering the City of Cheney's public storm system. The site will be graded to drain to sediment control ponds or temporary tanks on the lower site, near the Art Walk, off 7th Street.

Temporary catch basin protection should be installed and maintained on existing and new catch basins to filter sediment-laden water entering the existing storm conveyance system during construction.

#### Temporary Construction Features

The project will require temporary construction access from the upper west parking lot, and likely also from the lower lot area to the southeast. This access and other contractor laydown and trailer space will need to be coordinated with ongoing campus activities and circulation needs. Quarry spall work pads on disturbed soils, and silt fencing placed around the downhill portion of the site will further control soils and limit erosion. Soil stockpiles will need to be erosion protected, with plastic sheeting or other approved measures to prevent sediment migration from the site.

**Construction Debris:** The contractor will implement BMP's to prevent demolition and construction debris, waste, material, fuel, oil, lubricants, and other fluids from entering the public right of way and the existing storm conveyance system. All waste materials shall be disposed of in appropriate, legal locations. Recycling or reuse of demolished or excess material when appropriate is encouraged.

**Foundation Subdrainage:** A footing and slab drainage system will be incorporated, and discharge into a stormwater detention system described under G30 or directly into the campus stormwater system in under then Engineering lawn. This system discharges to the City system in 7th Street. . Slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drain pipes in the free-draining layer will gravity drain to the existing campus storm system.

#### **G20 Site Improvements**

**Site Development:** The building will be accessed from the parking lot on the west side off Washington Street, and from the lower site off the southeast at the Engineering Lawn. Delivery access can be made from either side.

**Landscaping:** A combination of xeriscape planting, grass lawns, biofiltration swales (described under G30), and trees will be provided.

**Irrigation:** An irrigation system will be provided, and will be supplemented by water collected in the stormwater detention system described under G30.

#### Site Paving

Site paving will consist of asphalt and concrete per University standards. Paving will be for new/replaced walks and drives around the new building and to patch utility trenches., in-kind matching existing surfaces.

Asphalt for restored parking areas and new loading/utility yard off west parking , assume 6-in of ½-in HMA over 6-in crushed base.

Concrete walks and plazas around the buildings, 6-in w/ reinforcing. Where needed for fire lane, 8-in thick pavement.

At University direction, some areas of new/replaced paving will have snow melt tubing and connection to campus or building boilers for heat.

#### Fire Truck Access

Fire truck access can be provided off the parking lot on the west side, at Washington Street and from 7th Street, via the Art Walk. There are three existing fire hydrants within a 300-foot radius of the proposed building. One off the Northwest corner of Cadet Hall appears to be in the footprint of the new addition, and should be moved (replaced) west into the parking lot.

#### Water Supply

Water mains: Existing Campus water mains are to the west, under the parking lot, and south between this site and the Art Buildings. Part of the campus main under the parking lot will need to be relocated further west to avoid the new addition west wing.

A single combined fire and domestic water service will be provided to the building from the University system water line under the west parking lot, and between the addition site and the Art Building. Alternately, the addition may be served from the existing 6-in service that enters the existing CEB from the west parking lot. Analysis from the plumbing and fire design will be required to confirm adequate flow from this 6-in connection.

Water Meter: An in-building water meter will be provided to measure the domestic water use in the new building for the purpose of; reporting trends in building systems consumption required by WA State law, reporting of meeting LEED criteria, and real-time display of building systems performance data for use by engineering courses at EWU.

#### Sanitary Sewer

All floors of the addition should be able to discharge waste by gravity to the campus sanitary sewer system located off the southeast of the site, under the engineering lawn. A new 6-in connection to this system is anticipated, approximately 150-ft of 6-in sewer pipe needed to make a new connection.

#### Stormwater Treatment and Disposal

The University's stormwater system drains to the City of Cheney's street storm system. Development of this addition will conform to the City's current surface water development manual which specifies stormwater design standards. The City has adopted the Spokane Regional Stormwater Manual, April 2008, which also governs stormwater design for Spokane County, the City of Spokane, and the City of Spokane Valley. Storm water collected off new roof areas will not need to be treated for water quality but can be directed to the new storm water flow control system (detention tank). If new and replaced vehicular use pavements exceed 5,000-sf within this project, then water quality treatment facilities will need to be provided for water collected off these surfaces. For small areas this is usually best done before detention. Cartridge filter systems or grass swales may be possible based on available space and locations.

Stormwater Detention System: The soils on the EWU campus are typically fine-grained and usually not suitable for infiltration as the sole source of stormwater disposal. Stormwater runoff, from the roof and from adjacent new and replaced pavements, will be routed to a detention system, approximately 2,500-CF in an underground tank or vault beneath the south, upper side of the site. This detention system will discharge to the storm system at the lower site level, below the Art building and near Media Lane. Approximately 60-ft of 8-in pipe will connect it to existing systems.

Foundation Subdrainage: A footing and slab drainage system will be incorporated, and discharge directly into the campus stormwater system. Below slab drainage will be a layer of washed, free draining aggregate underlain by a filter fabric. Perforated drain pipes in the free-draining layer will gravity drain to the existing campus storm system.

The existing campus storm system runs southeast in Media Lane and connects to City systems at

7th Street.

#### Connection to Campus Utility Tunnel

West of the site, under the asphalt parking lot, a branch of the campus utility tunnel provides access to many campus utilities, including power, communications, steam, and chilled water. A new low temperature heating water system will be installed near this building as part of the geothermal heating and cooling plant, which will be a separate project, near this building. Below grade, the new building will not directly affect the tunnel, the basement level will stop short of the tunnel walls. A short new spur off the tunnel will run into basement mechanical spaces allowing the new building to access campus utilities in the tunnel. Above grade the new addition will span over the tunnel, without bearing on it.

#### Gas Distribution

Natural gas service is provided to the existing CEB by Avista Utilities, from a service under the west parking lot. It may be possible for this service to provide for the new addition, or a new separate service to the addition provided. Gas loads from the mechanical design will determine the required path for this.

#### G4010 Electrical Distribution

The EWU Campus currently receives electrical utility power via two separate 13.2KV electrical service feeders from the City of Cheney. These two 13.2KV electrical service feeders are terminated within the EWU Rozell Substation at Campus Switchgear Bus #1 and Campus Switchgear Bus #2. Four separate 13.2KV campus feeders are routed from the Campus Switchgear to a system of 13.2KV switches located throughout the EWU campus in order to provide increased redundancy and flexibility to the campus electrical distribution system.

#### G4020 Site Lighting

Site lighting will be selected in conformance with EWU campus standards and will utilize full cut off LED light fixtures in order to avoid light trespass and meet associated dark sky lighting requirements. Site lighting which illuminates the path of egress will be supplied with power from the emergency generator system in the event of a failure on the normal power system. Site lighting will be controlled via a programmable low voltage lighting control system which will allow the site lighting to be automatically turned on and off at pre-programmed times.

#### G4090 Other Site Electrical Utilities

##### G4030 Site Communication/Data

Data/Communication service is provided to the existing building from the EWU owned data/com distribution system. Fiber optic cabling is typically routed throughout the EWU Campus via a system of cable tray that is located within the existing campus utility tunnel system. New telecommunications building service pathways will be provided and installed by the contractor. New building service pathways will be routed from the existing campus utility tunnel system into the main telecom room or be extended from the existing ground floor MDF in the existing building. Telecommunications building service cabling will be provided and installed by the contractor.

## EASTERN WASHINGTON UNIVERSITY

### PROJECT STEERING COMMITTEE

*\* Faculty and staff no longer with EWU*

Troy Bester, Sr Project Manager, Construction and Planning Services

\*Erin Ross, Director of Tribal Relations, Office of the President

\*Nydia Martinez, Dean of the College of Arts, Humanities, and Social Sciences

Mary Voves, VP-Business & Finance, Business and Finance

Laura Thayer, Assoc VP-Philanthropy Development

Erik Budsberg, PhD, Director of Sustainability, Office of Sustainability

Kris Jeske, Director of Construction and Planning, Construction and Planning Services

\*Shawn King, AVP, Facilities and Planning (retired)

### AMERICAN INDIAN STUDIES DEPARTMENT

Evanlene Melting Tallow, Program Coordinator/Recruiter

Margo Hill, , JD, MURP, Interim Director American Indian Studies, Associate Professor of Urban Planning

\*Deirdre Almeida, PhD, Director of American Indian Studies Program

Kathleen Warren, Secretary, American Indian Studies Program

### STAKEHOLDERS

Brock Belgarde, Program Manager of Archives & Records, Collville Tribes

Michele Siedenbug, Business Manager- Archeological and Historical Services

Steven Bingo, Digital Projects Archivist

### STUDENT ENGAGEMENT-NATIVE AMERICAN STUDENT ASSOCIATION (NASA)

On November 17, 2022, and February 15, 2024, many members of NASA, lead by former President Strong Heart, and current President War Bear, attended predesign engagement sessions. During these sessions students provided input related to visioning, site selection and programming as part of the predesign effort.

We wish to thank all NASA members for their time and feedback to the Pre-design Team.

Section 01

# EXECUTIVE SUMMARY

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 01

# EXECUTIVE SUMMARY

Lucy Covington, a long-time tribal rights activist and Colville Tribal Council member, helped change the course of American Indian history through her courageous and selfless style of leadership. She worked with members of her own tribe and other tribes across the country to help preserve tribal sovereignty and self-determination. She also worked to protect tribal rights and resources, develop tribal services, govern the reservation for the benefit of tribe members, and promote inter-tribal cooperation.

Lucy exemplified American Indian self-determination in action and her efforts engendered a shift of U.S. policy from termination to independence and autonomy. She is considered “the most significant advocate for American Indians in the last half of the 20th century” (Mark Trahan, *The Last Great Battle of the Indian Wars*). Covington died in 1982, at age 71.

In 2015, Eastern Washington University posthumously presented an honorary doctorate to Lucy Covington and announced the creation of a student center in her name.

The proposed Lucy Covington Leadership House facility encompasses approximately 10,000 net assignable square feet (NASF) designated for community gathering, student support, and exhibition to support American Indian students. This facility will further the goals of Eastern Washington University’s Lucy Covington Initiative and their commitment to regional tribes by honoring Lucy Covington’s legacy and providing dedicated support for American Indian students.

## PROBLEM STATEMENT

American Indian students are vastly underrepresented in higher education, making up less than one percent of college students. While many factors contribute to low college attendance rates for American Indian students, most of those barriers can be traced back to a singular source: invisibility. Eastern Washington University (EWU) hopes to create a space where American Indian and non-American Indians can work together to combat invisibility of the Indigenous peoples of this region.

Declining enrollment of American Indian students is also a critical problem. American Indian student enrollment, at EWU and across the state of Washington, has declined by approximately 40 to 50 percent over the last 15 years. In contrast, other race/ethnicity groups have increased by 60 percent or more in the same time frame. The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU.

The Initiative seeks to support future leaders by honoring her legacy, educate the next generation of American Indian leaders, create a confluence of cultures and causes through community scholars and tribal leaders, and develop an archival project documenting the efforts of Lucy Covington and those who fought with her to protect sovereignty and self-determination.

The Lucy Covington Leadership House will also further the goals of Eastern Washington University’s commitment to the Memoranda of Understanding (MOU) with three regional tribes, the purpose of which is to sustain and advance relationships with EWU and construct a longhouse-style facility on campus.

Lucy Covington Leadership House will address these problems identified in its project goals:

- > Create visibility and a sense of belonging for American Indian students with a dedicated facility that supports self-exploration and self-understanding of their values, identities, cultural heritage, and career paths.
- > Improve access and retention of American Indian students by serving as a center to support their growth and development at EWU.
- > Bring together national speakers, scholars, academics, traditional practitioners, and Native leaders to share their experiences, wisdom, research, and indigenous knowledge.
- > Develop programming that promotes understanding across cultures and political boundaries to address challenges and opportunities.
- > Provide exhibit space for digital historic documents pertaining to the life and work of Lucy Covington as a part of the continued education related to the importance of protecting tribal sovereignty and self-determination.
- > Open exhibit space to local tribes, American Indian students, and artists to display their work and culture.

## ALTERNATIVES CONSIDERED

Through the predesign process, the design team considered a range of alternatives to meet the needs identified in Section 02. Alternatives that were evaluated include:

- > Preferred Alternative: Lucy Covington Leadership House (~15,000 GSF)
- > Alternative 1: Full Buildout, Preferred Alternative + Future Expansion (~33,000 GSF)
- > Alternative 2: No Action

Alternatives were evaluated in terms of advantages, disadvantages, cost, and schedule. Each alternative is summarized next.

### PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)

The conceptual program for the Preferred Alternative allocates approximately 10,000 net assignable square feet (NASF) for a total of approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering and event space, student support and collaboration areas, and an exhibit gallery and performance space.

The proposed building concept provides a speaking hall that accommodates up to 300 people for community and cultural events, a learning commons for studying and student collaboration, and an exhibit space featuring the life and legacy of Lucy Covington and American Indian Art and Culture.

The Preferred Alternative achieves many of the project's goals and addresses the identified problem.

### ALTERNATIVE 1: PREFERRED ALTERNATIVE + POSSIBLE FUTURE EXPANSION (28,000 GSF)

The full buildout alternative expands the program by approximately 8,000 NASF for a total of approximately 13,000 additional GSF. The full buildout proposes building the 15,000 GSF Preferred Alternative along with a 13,000 GSF expansion for a total buildout of 28,000 GSF.

In addition to providing cultural/community gathering and event spaces, student collaboration and support spaces, and exhibit gallery and performance spaces, the full buildout will have instructional program spaces that expand the American Indian Studies program and introduce new programs such as a Tribal Government program and dedicated Salish Language teaching space. There will be additional classrooms and faculty offices associated with this expansion.

Alternative 1 achieves and expands upon the project's goals and addresses the problems identified. Although Alternative 1 more fully achieves the project goals, it was not chosen due to the following challenges:

- > Requires additional capital funding and therefore would result in a larger capital project funding request.
- > Operational funding to expand academic programs as described above has not yet been procured.

### ALTERNATIVE 2: NO ACTION

The No Action Alternative would perpetuate the substandard quality of experience and poor retention rates for American Indian students at EWU. American Indian students would continue to have limited representation on campus and limited space dedicated to their support. They would need to continue to use the one inadequate room available in the existing American Indian Education Center building, which houses the American Indian Studies program, for meetings, studying, and socializing.

Additionally, Alternative 2 - No Action, does not fulfill EWU's strategic mission in the following ways:

- > It does not create a presence on campus for American Indian students and American Indian culture, even though there are at least four major Tribal nations in the vicinity of Eastern Washington University.
- > It does not fulfill one of the primary purposes of the Memoranda of Understandings between EWU and three Tribal Nations: to construct a longhouse-style facility that enhances recruitment and success of American Indian students.

**TABLE:**  
**Numeric Program Summary**

## PREFERRED ALTERNATIVE

### PROGRAM

The conceptual program for the Preferred Alternative allocates 15,000 GSF into a new one-story Lucy Covington Leadership House that supports the project goals. The building program focuses on three key areas that support the goals of the Lucy Covington Initiative: Community Gathering, Student Support, and Celebrating Lucy Covington's Life and Legacy.

The building has an efficiency of 65 percent and provides the following program areas:

- > A 300-seat Speaking Hall and associated support areas.
- > A dedicated American Indian Student Center that includes a Learning Commons (student lounge, small group rooms, and makerspace), community kitchen and dining, and flexible meeting areas.
- > An exhibit hall that celebrates the life and legacy of Lucy Covington and tribal cultures.

### PREFERRED ALTERNATIVE

| PROGRAM AREA                               | NSF             | % of NSF           |
|--|-----------------|--------------------|
| <b>COMMUNITY GATHERING AREAS</b>           |                 |                    |
| Speaking Hall                              | 5,100           | 52.6%              |
| <b>AMERICAN INDIAN STUDENT CENTER</b>      |                 |                    |

**DIAGRAM:**  
**Preferred Alternative: Lucy Covington Leadership House**

**SITE**

For the purposes of this Predesign study, the Reid site was selected by stakeholders for the Lucy Covington Leadership House. It is directly south of Martin and Williamson Hall at the southeastern edge of the EWU campus in Cheney, Washington and is approximately 1.4 acres in size.

It is important to note that its status as the final choice may be subject to change pending updates to EWU's Campus Master Plan. As EWU moves forward with updating its Master Plan, future projects will need to align with the revised vision and objectives outlined in that plan.

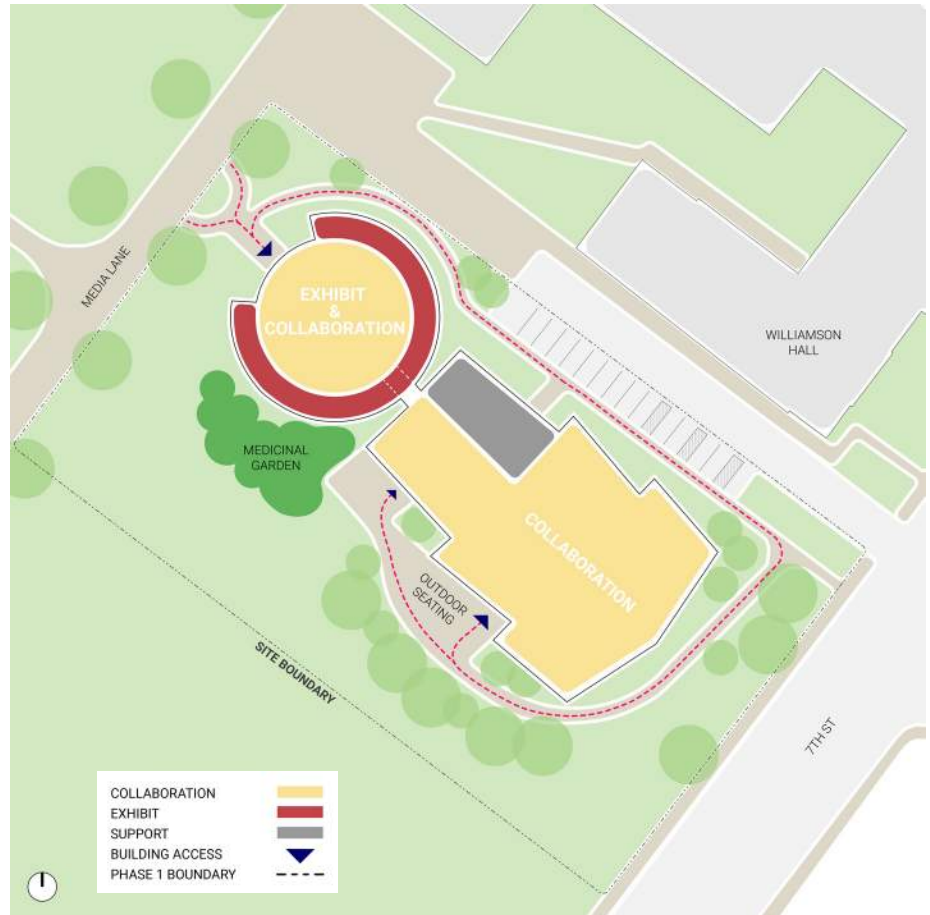

**BUILDING CONFIGURATION**

The Preferred Alternative concept for the Lucy Covington Leadership House is a 15,000-square-foot, one-story building. The main building entry is located off of the primary pedestrian thoroughfare on campus.

Through the vestibule, students will be welcomed into the Learning Commons, a circular lounge and student support area. This area is designed for group gatherings and collaborative activities, but also includes contemplative spots that provide areas for focused study and respite. It is surrounded by an exhibit area that will showcase Lucy Covington's life and tribal cultures.

The Learning Commons' double-height volume will integrate a skylight that will enhance natural light and provide a visual link between the sky, the occupants, and the earth, connecting building users to the natural environment.

From here, a longhouse-inspired volume can be accessed, which will be used for more formal gathering. This area contains the Speaker Hall at the south end, as well as centrally-located community kitchen and dining areas, a makerspace, and the main service core, including restrooms and building system areas.

The south and southwest edges of the site will use land-sculpting to create earthen berms. These will provide screening and casual places to sit during events, as the dining area and Speaking Hall will open onto these areas and create a more seamless indoor/outdoor experience.

**TABLE:**  
**Budget Request / Cost Summary (Top / Center)**  
**Project Schedule (Bottom)**

## PROJECT BUDGET & SCHEDULE

### PROJECT BUDGET

The state funding request for this project is approximately \$21 million, with Design funding requested in the 2025-27 Biennium and construction funding requested in the 2027-29 Biennium.

### PROJECT SCHEDULE

The anticipated project schedule for the Preferred Alternative is shown at right, and assumes design and construction funding are awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

| Agency / Institution Project Request              |                     |
|---|---------------------|
| Design / Construction Request, 2025-2027 Biennium | \$20,739,000        |
| <b>Total Project Request</b>                      | <b>\$20,739,000</b> |
| Pre-Design Report (Non-State Funds)               | \$300,000           |
| <b>Total Project Funds</b>                        | <b>\$21,039,000</b> |

| Probable Cost Estimate Summary: Preferred Alternative |                     |             |
|---|---------------------|-------------|
| Construction Cost                                     | \$16,110,800        | 77.7%       |
| Consultant Services                                   | \$2,765,000         | 13.3%       |
| Equipment   | \$643,100           | 3.1%        |
| Artwork   | \$103,200           | 0.5%        |
| Project Administration                                | \$1,117,200         | 5.4%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                             | <b>\$20,739,000</b> | <b>100%</b> |

# PROBLEM STATEMENT

- A. Problem Identification
- B. Statutory & Other Requirements
- C. Connection to Agency Mission, Goals, & Objectives
- D. What is Needed to Solve the Problem
- E. Relevant Project History

[This page intentionally left blank for the purpose of double-sided printing.]

SECTION 02

PROBLEM STATEMENT

A. PROBLEM IDENTIFICATION

PROJECT OPPORTUNITY

American Indian students are vastly underrepresented in higher education, making up less than one percent of college students. While many factors contribute to low college attendance rates for American Indian students, most of those barriers can be traced back to a singular source: invisibility. Eastern Washington University (EWU) hopes to create a space where American Indian and non-American Indians can work together to combat the invisibility of the Indigenous peoples of this region.

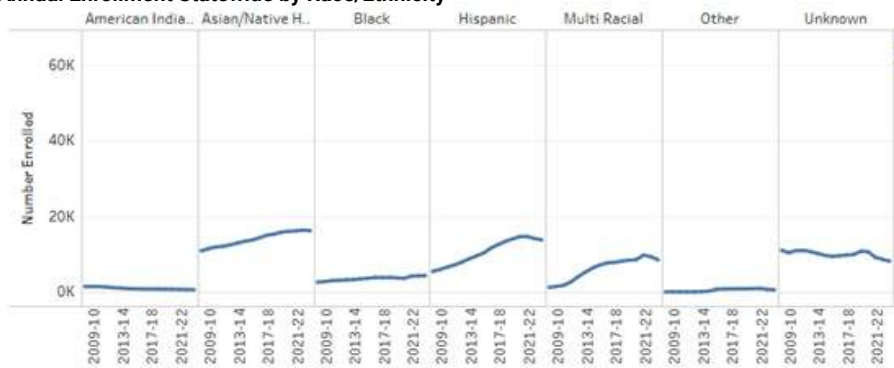

The issue of invisibility severely impacts how non-Native individuals and organizations interact, or more importantly, avoid interacting and partnering with American Indian and Alaskan Native populations. EWU hopes to create a space where they can work together to combat the invisibility of the Indigenous peoples of this region.

Declining enrollment of American Indian students is also a critical problem. American Indian student enrollment, at EWU and across the state of Washington, has

declined by approximately 40 to 50 percent over the last 15 years. In contrast, other race/ethnicity groups have increased by 60 percent

or more in the same time frame. The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU.

Annual Enrollment Statewide by Race/Ethnicity

Annual Enrollment at Eastern Washington University by Race/Ethnicity

\*Reference: <https://erdc.wa.gov/data-dashboards/public-four-year-dashboard#annual-enrollment>

## B. STATUTORY & OTHER REQUIREMENTS

### STATUTORY & OTHER REQUIREMENTS

#### Memoranda of Understanding

The Lucy Covington Leadership House will further the goals of Eastern Washington University's commitment to the Memoranda of Understanding (MOUs) with three regional Tribes: Coeur d'Alene (July 26, 2019), Kalispel (February 12, 2018), and Spokane (April 15, 2019).

The primary purpose of the MOUs is to sustain and advance relationships between EWU and these Tribes and is summarized as follows:

- > Establish an Annual Tribal Leadership Summit.
- > Establish an American Indian Advisory Board where each Tribe has the authority to appoint one individual.
- > Recruit, retain, and successfully graduate more American Indian students.
- > Recruit, retain, and promote qualified American Indian faculty and staff to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
- > Strengthen partnerships between tribal communities and EWU academic and student support areas.
- > Plan and construct a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's Tribes, and serves as a place for cultural learning and exchange for the entire community.

Through the MOUs, the preceding priorities will receive sustained attention from EWU and the Tribes to maintain communication and address shared objectives.

The MOUs are guided in spirit by the Centennial Accord between the Federally Recognized Indian Tribes in Washington State and the State of Washington of 1989. The accord affirms the sovereignty of Washington's federally recognized tribes and calls for clearer communication and better collaboration between tribal and state governments.

For more information on the Centennial Accord, follow the link: Centennial Accord | GOIA (wa.gov).

The MOUs are included in the Appendices for reference.

#### Lucy Covington Center Repository Research Agreement

Through an ongoing partnership with the Colville Confederated Tribes that Eastern Washington University formalized in the 'Lucy Covington Center Repository Research Agreement,' EWU intends to honor Lucy Covington's legacy. The Initiative identifies the following emphasis areas: supporting future leaders; creating a confluence of culture and causes; and developing a Lucy Covington Archive.

Development on EWU campus is regulated by the Cheney Municipal Code and the 2014 EWU Comprehensive Campus Master Plan (EWU CCMP). The Campus Master Plan is being updated in 2024-2025.

## C. CONNECTION TO AGENCY MISSION, GOALS & OBJECTIVES

The EWU Strategic Plan is in draft form at the time of this Predesign publication. The following narrative demonstrates how this project is in alignment with the draft mission, goals, objectives, and desired outcomes identified.

The Lucy Covington Leadership House and Lucy Covington Initiative are part of EWU's strategic plan to increase graduation rates of underrepresented students (including American Indians).

The Lucy Covington Leadership House will support this endeavor through programs and events within the facility intended to boost enrollment and retention of American Indian students.

The Lucy Covington Leadership House aligns with EWU's mission to foster an inclusive, equitable, and transformative learning environment. American Indian students at EWU have significant barriers to accessing higher education, have a higher risk of dropping out, and lower retention rates compared to other groups. American Indian students have barriers common to first-generation, low-income, and other structurally marginalized students. EWU strives to integrate the principles of justice, equity, diversity and inclusion into all University operations to foster an environment that nurtures a sense of belonging among all members of the community.

### SENSE OF BELONGING

EWU strives to foster a profound sense of belonging, actively promote and sustain equity, dismantle systemic barriers, and embrace the unique perspectives of all individuals. As a desired outcome of this goal, the Lucy Covington Leadership House will create an important space to nurture this sense of belonging for American Indian students who often commute great distances from their reservations to be at Eastern Washington University.

### STUDENT SUCCESS AND STUDENT EXPERIENCE

Another important goal is to promote student success and close structural equity gaps through a holistic, decolonial, people-centered, value-driven approach that prioritizes student well-being in multiple dimensions and supports students' self-exploration and self-understanding of their values, identities, cultural heritages and career paths.

As a facility dedicated to empowering and supporting American Indian students, the Lucy Covington House will be a home for American Indian students' academic advising and student services, and will help them break through the systemic barriers noted above.

- > Build a virtual archive of historic documents pertaining to the work of Lucy Covington as a part of the continued research and education regarding the importance of protecting sovereignty and self-determination.

## D. WHAT IS NEEDED TO SOLVE THE PROBLEM

The Lucy Covington Leadership House is part of the broader Lucy Covington Initiative at EWU. The initiative seeks to support future leaders by honoring her legacy, educate the next generation of Native American leaders, create confluence of cultures and causes through community scholars and tribal leaders, and develop an archival project documenting the efforts of Lucy Covington and those who fought with her to protect sovereignty and self-determination.

The Lucy Covington Leadership House will address the identified problems in its project goals:

- > Create visibility and a sense of belonging for American Indian students with a dedicated facility that supports self-exploration and self-understanding of their values, identities, cultural heritage, and career paths.
- > Improve access and retention of American Indian students by serving as a center for American Indian students to support their growth and development at EWU. It will be a center where these students can have a sense of belonging.
- > Bring together national speakers, scholars, academics, traditional practitioners, and Native leaders to share their experiences, wisdom, research, and indigenous knowledge.
- > Develop programming that promotes understanding across cultures and political boundaries to address challenges and opportunities.

## E. RELEVANT PROJECT HISTORY

There have been no previous predesign studies or capital funding requests for the Lucy Covington Leadership House.

[This page intentionally left blank for the purpose of double-sided printing.]

Section 03

# ANALYSIS OF ALTERNATIVES

A. Description of Alternatives

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 03

# ANALYSIS OF ALTERNATIVES

## A. DESCRIPTION OF ALTERNATIVES

The predesign team considered a range of alternatives to meet the needs identified in Section 02. Alternatives that were evaluated include:

- > Preferred Alternative: Lucy Covington Leadership House (~15,000 GSF)
- > Alternative 1: Full Buildout, Preferred Alternative + Future Expansion (~28,000 GSF)
- > Alternative 2: No Action

Alternatives were evaluated in terms of advantages, disadvantages, cost, and schedule. Each alternative is summarized below and on the following pages.

### PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)

The conceptual program for the Preferred Alternative allocates approximately 10,000 net assignable square feet (NASF) for a total of approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering and event space, student support and collaboration areas, and an exhibit gallery and performance space.

The proposed building concept provides a speaking hall that accommodates up to 300 people for community and cultural events, a learning commons for studying and student collaboration, and an exhibit space featuring the life and legacy of Lucy Covington and American Indian Art and Culture.

The Preferred Alternative achieves many of the project's goals and addresses the identified problem.

### ALTERNATIVE 1: FULL BUILDOUT, PREFERRED ALTERNATIVE + FUTURE EXPANSION (~28,000 GSF)

The full buildout alternative expands the program by approximately 8,000 NASF for a total of approximately 13,000 additional GSF. The full buildout proposes building the 15,000 GSF Preferred Alternative along with a 13,000 GSF expansion for a total buildout of 28,000 GSF.

In addition to providing cultural/community gathering and event spaces, student collaboration and support spaces, and exhibit gallery and performance spaces, the full buildout will have instructional program spaces that expand the American Indian Studies program and introduce new programs such as a Tribal Government program and dedicated Salish Language teaching space. There will be additional classrooms and faculty offices associated with this expansion.

**IMAGE:**  
Isle Hall

Alternative 1 achieves and expands upon the project's goals and addresses the problems identified. Although Alternative 1 more fully achieves the project goals, it was not chosen due to the following challenges:

- > Requires additional capital funding and therefore would result in a larger capital project funding request.
- > Operational funding to expand academic programs as described above has not yet been procured.

### **ALTERNATIVE 2: NO ACTION**

The No Action Alternative would perpetuate the substandard quality of experience and poor retention rates for American Indian students at EWU. American Indian students would continue to have limited representation on campus and limited space dedicated to their support. They would need to continue to use the one inadequate room available in the existing American Indian Education Center building, which houses the American Indian Studies program, for meetings, studying, and socializing.

Additionally, Alternative 2 - No Action, does not fulfill EWU's strategic mission in the following ways:

- > It does not create a presence on campus for American Indian students and American Indian culture, even though there are at least four major Tribal nations in the vicinity of Eastern Washington University.
- > It does not fulfill one of the primary purposes of the Memoranda of Understandings between EWU and three Tribal Nations: to construct a longhouse-style facility that enhances recruitment and success of American Indian students.

### **ADDITIONAL STUDY: ISLE HALL SITE LOCATION**

Site locations for the project were reviewed as part of the Predesign process, and included engagement with the Project Steering Committee, American Indian EWU students, and EWU American Indian Studies faculty.

Although not selected, the Isle Hall site was considered as a potential location due to its visibility and gateway location on campus. However, constituents voiced concerns about the level of vehicular traffic and related noise, as well as the cost impact of demolishing the existing building if it could not be retrofitted into an appropriate American Indian cultural space. The site is also limited in size and therefore would likely not accommodate both the proposed building and the significant outdoor space needed for this program, without constructing a new multi-story facility.

The Isle Hall building site still presents a promising opportunity for the project. Utilizing the Isle site could lead to significant improvements in

Campus Energy Use Intensity (EUI) and provide a pathway towards compliance with the Clean Building Performance Standard and HB1390. This aligns with EWU's commitment to sustainability, carbon reduction, and energy efficiency. The forthcoming campus decarbonization and master plan will provide guidance regarding siting optimization.

Once the project is funded, further evaluation of this site should be incorporated into the design phase.

## **A.2 ADVANTAGES & DISADVANTAGES OF EACH ALTERNATIVE**

A summary of the advantages and disadvantages of each alternative is included in the table on the following page.

**TABLE:**  
**Comparative Summary of Alternatives**

|                      | <b>Preferred Alternative:</b><br><b>Lucy Covington Leadership House</b><br>(~15,000 GSF)   | <b>Alternative 1:</b><br><b>Full Buildout, Preferred Alternative +</b><br><b>Future Expansion</b><br>(~28,000 GSF)   | <b>Alternative 2:</b><br><b>No Action</b>   |
|----------------------|--|--|---|
| <b>Est. Cost</b>     | <b>\$20,739,000</b>  | <b>\$39,177,000</b>  | No capital funding request.   |
| <b>Advantages</b>    | <p>Provides 15,000 GSF of assembly, student support and exhibit space.</p> <p>Addresses the problems defined in Section 02 and achieves the project goals.</p>   | <p>Provides 28,000 GSF of assembly, student support and exhibit space along with instructional and faculty office space.</p> <p>Addresses the problems defined in Section 02 and achieves the project goals. It expands upon these goals by expanding the instructional programs currently under American Indian Studies and adds space for a Tribal Government program, an essential program affiliated with the Lucy Covington Initiative.</p> | Lower first cost.   |
| <b>Disadvantages</b> | <p>Requires nearly \$21 million of capital funding from the Washington State legislature.</p> <p>Does not include instructional space for expanding American Indian Studies or create dedicated space for a Tribal Government Program.</p> | <p>Requires approximately \$39 million of capital funding from the Washington State legislature.</p> <p>Additional academic costs are also required to expand the American Indian Studies program along with academic cost to support a new Tribal Government Program. These costs have not yet been factored in by EWU. Further development is needed before programs may be expanded upon or introduced.</p>                                   | <p>Currently, the American Indian Education Center contains space dedicated to American Indian Studies program. It also offers a study area with available computers, space for meetings, activities, and socializing. It does not meet all the needs of current students.</p> <p>&gt;The limited space does not offer enough space to accommodate the number of current American Indian students who are seeking a space to connect with other American Indian students.</p> <p>&gt;Building location is not centrally located on campus, further emphasizing lack of visibility for American Indian students.</p> <p>&gt;The American Indian Studies building is not reflective of indigenous culture- neither in special organization, nor materiality, as it was originally designed as a church.</p> <p>&gt;Due to its age, the building offers very limited accessibility. The main accessible entry is on the back side of the building offering unequitable experience to students, faculty or visitors with mobility impairments.</p> <p>&gt;The quality of interior spaces is hindered by the lack of natural light, impacting student wellbeing.</p> |

**TABLES:**  
**Cost Estimate of Preferred Alternative and Alternative 1 (Top and Center)**  
**Life Cycle Cost Summary Table (Bottom)**

## A.3 COST ESTIMATES

### PROJECT COST

Cost estimate summary information for the Preferred Alternative and Alternative 1 – Full Buildout is shown at right.

There is no imminent project associated with Alternative 2 – No Action, and therefore no project cost estimate is provided.

A detailed cost model for the Preferred Alternative is included in Appendix B.

### LIFE CYCLE COST MODEL

Each alternative was analyzed using the Life Cycle Cost Model (LCCM) tool provided by the Office of Financial Management. A summary is shown at lower right for the Preferred Alternative and a lease option.

Additional LCCM information for the Preferred Alternative is included in Appendix B.

| Probable Cost Estimate Summary: Preferred Alternative |                     |             |
|---|---------------------|-------------|
| Construction Cost                                     | \$16,110,800        | 77.7%       |
| Consultant Services                                   | \$2,765,000         | 13.3%       |
| Equipment   | \$643,100           | 3.1%        |
| Artwork   | \$103,200           | 0.5%        |
| Project Administration                                | \$1,117,200         | 5.4%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                             | <b>\$20,739,000</b> | <b>100%</b> |

| Probable Cost Estimate Summary: Alternative 1 Full Buildout |                     |             |
|---|---------------------|-------------|
| Construction Cost   | \$30,194,600        | 77.1%       |
| Consultant Services   | \$5,349,700         | 13.7%       |
| Equipment   | \$1,286,200         | 3.3%        |
| Artwork   | \$194,900           | 0.5%        |
| Project Administration                                      | \$2,151,800         | 5.5%        |
| Other Costs   | \$0                 | 0.0%        |
| <b>Total Project Cost</b>                                   | <b>\$39,177,000</b> | <b>100%</b> |

| Life Cycle Cost Model Summary: Preferred Alternative Ownership Option |                 |
|---|-----------------|
| Total Gross Square Feet   | 15,000          |
| Total Rentable Square Feet  | 9,690           |
| Occupancy Date  | November 1,2028 |
| Initial Project Costs   | \$15,756,338    |
| Est. Construction TPC (\$/GSF)  | \$1,170         |
| RSF/Person Calculated   | 14              |
| 30 year Net Present Value   | \$15,781,209    |
| 50 year Net Present Value   | \$33,471,153    |

| Life Cycle Cost Model Summary: Lease Option         |                 |
|---|-----------------|
| Total Rentable Square Feet                          | 15,000          |
| Annual Lease Cost (Initial Term of Lease)           | \$469,950       |
| New Lease Operating Cost/SF (Initial Term of Lease) | \$11.61         |
| Occupancy Date                                      | November 1,2028 |
| Project Initial Costs                               | \$1,257,423     |
| RSF/Person Calculated                               | 17              |
| 30 year Net Present Value                           | \$27,695,053    |
| 50 year Net Present Value                           | \$34,764,668    |

**TABLES:**  
**Estimated Project Schedule**

## A.4 ESTIMATED SCHEDULES

A summary of the anticipated schedule for the Preferred Alternative and Alternative 1 – Full Buildout is shown at right, including anticipated start, midpoint, and completion dates.

There is no imminent project associated with Alternative 2 – No Action, and therefore no estimated project schedule is provided.

### **PREFERRED ALTERNATIVE: LUCY COVINGTON LEADERSHIP HOUSE (15,000 GSF)**

The anticipated project schedule for the Preferred Alternative assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

### **ALTERNATIVE 1: FULL BUILDOUT, PREFERRED ALTERNATIVE + FUTURE EXPANSION (~28,000 GSF)**

The Alternative 1 – Full Buildout schedule also assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget. The anticipated schedule is the same as for the Preferred Alternative.

| Project Schedule: Preferred Alternative + Alternative 1 Full Buildout |          |               |               |
|---|----------|---------------|---------------|
| PHASE   | DURATION | START DATE    | END DATE      |
| Design / Construction Funding   |          | July 2025     |               |
| Design  | 12 mos.  | November 2026 | November 2027 |
| Construction  | 12 mos.  | November 2027 | November 2028 |
| Move-In / FF&E  | 3 mos.   | November 2028 | February 2029 |
| Occupancy   |          | February 2029 |               |

## SECTION 04

# DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

## A. SCOPE & PROJECT DESCRIPTION

The conceptual program for the Preferred Alternative allocates 15,000 GSF into a new one-story Lucy Covington Leadership House that supports the project goals described in Section 02, Problem Statement. The building program focuses on three key areas that support the goals of the Lucy Covington Initiative: Community Gathering, Student Support, and Celebrating Lucy Covington's Life and Legacy.

### Community Gathering

Lucy Covington Leadership House is well-suited to provide a culturally responsive center for collaboration between students, faculty, and tribal nations. With a vision of the Tribal Government Leadership program, the core element of Lucy Covington's Legacy, being established in the future, a large Speaking Hall will provide a unique American Indian multipurpose space to host speakers, performances, and community gatherings.

### Student Support

Research indicates that student services are critical to the development and success of students. The Lucy Covington Leadership House is primarily envisioned to support the success of American Indian students attending EWU.

The American Indian Student Center in the new facility will provide a "home away from home" and create a sense of community for these students, allowing for an easier transition from reservation to university. The building will have student support spaces such as a study lounge, makerspace, and collaboration areas, along with flexible meeting space that be used for drop-in counseling and advising.

### Celebrating Lucy Covington's Life and Legacy

Lucy Covington's life and legacy can be represented through the following key themes: her warm and welcoming personality, storytelling, and sense of responsibility.

Predesign engagement sessions and research indicated that Lucy Covington's story would be best commemorated by conveying her warmth and welcoming presence immediately upon entry into the building. Display and exhibition pieces will showcase Lucy's achievements alongside the achievements of other American Indian artists and regional and national leaders, emphasizing storytelling, interactivity, and self-reflection. A space for storytelling will be created through the intersection of interactive exhibits of Indigenous art, music, and performance.

The facility will honor Lucy's life by passing on her teachings and leadership legacy and imparting a sense of responsibility to young American Indians to be connected to their roots while succeeding and becoming leaders in the contemporary world.

**IMAGE:**

**Native American Student Association (NASA)  
Visioning Session with Design Team**

**PROJECT GOALS**

In alignment with EWU's Lucy Covington Initiative, the Lucy Covington Leadership House will help equip and encourage generations of American Indian youth to protect and enhance the welfare of their tribes and tackle the most pressing issues facing humanity. American Indian students are facing many challenges as they are transitioning from their reservation to navigating through higher education. Among them, the lack of visibility and representation is a significant barrier and reason for low success rates in higher education.

A primary goal of this longhouse-inspired facility is to recruit and retain American Indian students, set them up for success, and prepare them for leadership roles within their tribal communities and the wider region. In addition, the building will host opportunities for American Indian students to model leadership driven by indigenous values and follow Lucy Covington's leadership legacy, providing a steppingstone for the future leaders of tribal governments standing for tribal sovereignty.

The Lucy Covington Leadership House will serve as a foundation for building interdisciplinary partnerships, but most importantly it will center indigenous knowledge and work against the erasure of the indigenous histories. In the long term, the building will also help attract and retain leading indigenous scholars, practitioners, and leaders to share experiences, wisdom, and research through teaching and mentoring at EWU.

The Lucy Covington Leadership House will facilitate learning from history, healing, and the restoration of culture and identity of American Indians. It will be a teaching tool to support the University's Climate Action Plan and Prairie Restoration project, serving as a bridge between tradition and the future. In the long term, the facility will support the need for sustainability and climate change education.

**STUDENT INPUT TOWARDS  
PROJECT VISION**

Student engagement with EWU's Native American Student Association during the predesign process garnered input about the American Indian Student Center. The discussion fell into three key themes for students: empowerment, stewardship and University support, and reclamation.

**Empowerment:** Providing a home for American Indian students at EWU will provide the opportunity for these students to feel safe, recognized, and acknowledged on campus. It will be a place for them to connect with their heritage.

**Stewardship & University Support:** Students believe that the Center will be a great resource for all people to understand and connect with American Indian culture. As a facility that provides support for American Indian students, the project may be a catalyst toward improving access, inclusion, and retention for all students, particularly students of color and disenfranchised populations.

**Reclamation:** Students want the opportunity for more visibility on campus. The building should serve as a beacon of American Indian culture, pride and indigenous reclamation.

**SUSTAINABLE ECOLOGIES**

Buildings are responsible for some 40 percent of total annual global greenhouse emissions. To impact climate change, they must be designed sustainably from the start. Although building design is often driven by first costs, sustainable design must move beyond this approach and address the triple bottom line: economy, ecology, and equity.

True sustainability is a balance between responsible use of public resources, preservation of ecological systems, and support of societal needs. Eastern Washington University understands these imperatives and has made sustainability a central tenet of their identity and mission, which will be reflected in the Lucy Covington Leadership House.

**CHARTS:**  
**Area Allocation by Space Type**  
**Area Allocation by Program**

## A.1 NATURE OF SPACE

Lucy Covington Leadership House’s net assignable program areas have three primary functions, or space types: community gathering, exhibition, and student support.

Of the assignable building area, 53 percent is allocated for Community Gathering Areas, comprised of a Speaking Hall and its support areas, 37 percent is allocated for the American Indian Student Center, including a Learning Commons, Dining Area, and Flexible Meeting Space, and 10 percent is allocated for Exhibition Areas, including the Lucy Covington Life and Legacy Gallery.

### COMMUNITY GATHERING AREAS

#### Speaking Hall

The Speaking Hall will serve a variety of different gathering and performance functions, but its primary intent is to bring American Indians together from around the region. It will serve to hold events where indigenous knowledge is shared, and it will encourage collaboration between indigenous practitioners, scholars, and leaders from the region, nation, and international community.

The space will accommodate approximately 300 lecture-style tiered seats. The building’s spatial organization and finishes will draw inspiration from indigenous architecture, resembling a longhouse-style space. Additional Speaking Hall support areas include an audio-visual room, a green room, and designated furniture storage.

#### AMERICAN INDIAN STUDENT CENTER

##### Learning Commons

The Learning Commons provides a variety of collaborative spaces to create a welcoming environment for students, mentors, staff, and visitors to engage in multiple ways. Areas include a study lounge, small group collaboration spaces, and a makerspace / open work

area. The study lounge will provide a centralized, collaboration space for American Indian students to feel at home and interact on a daily basis. The lounge will provide flexible space for approximately 40 students in soft seating and table seating areas. Small group collaboration spaces will provide places for groups to meet, study, and build community.

The makerspace/ open work area is dedicated for American Indian students’ use and provides a home for their ongoing projects. This space, sized for up to 16 students, opens out to an exterior patio to accommodate larger projects and promote visibility of American Indian culture and traditions on campus. The makerspace will support guest artists and craftsmen passing down indigenous craft and

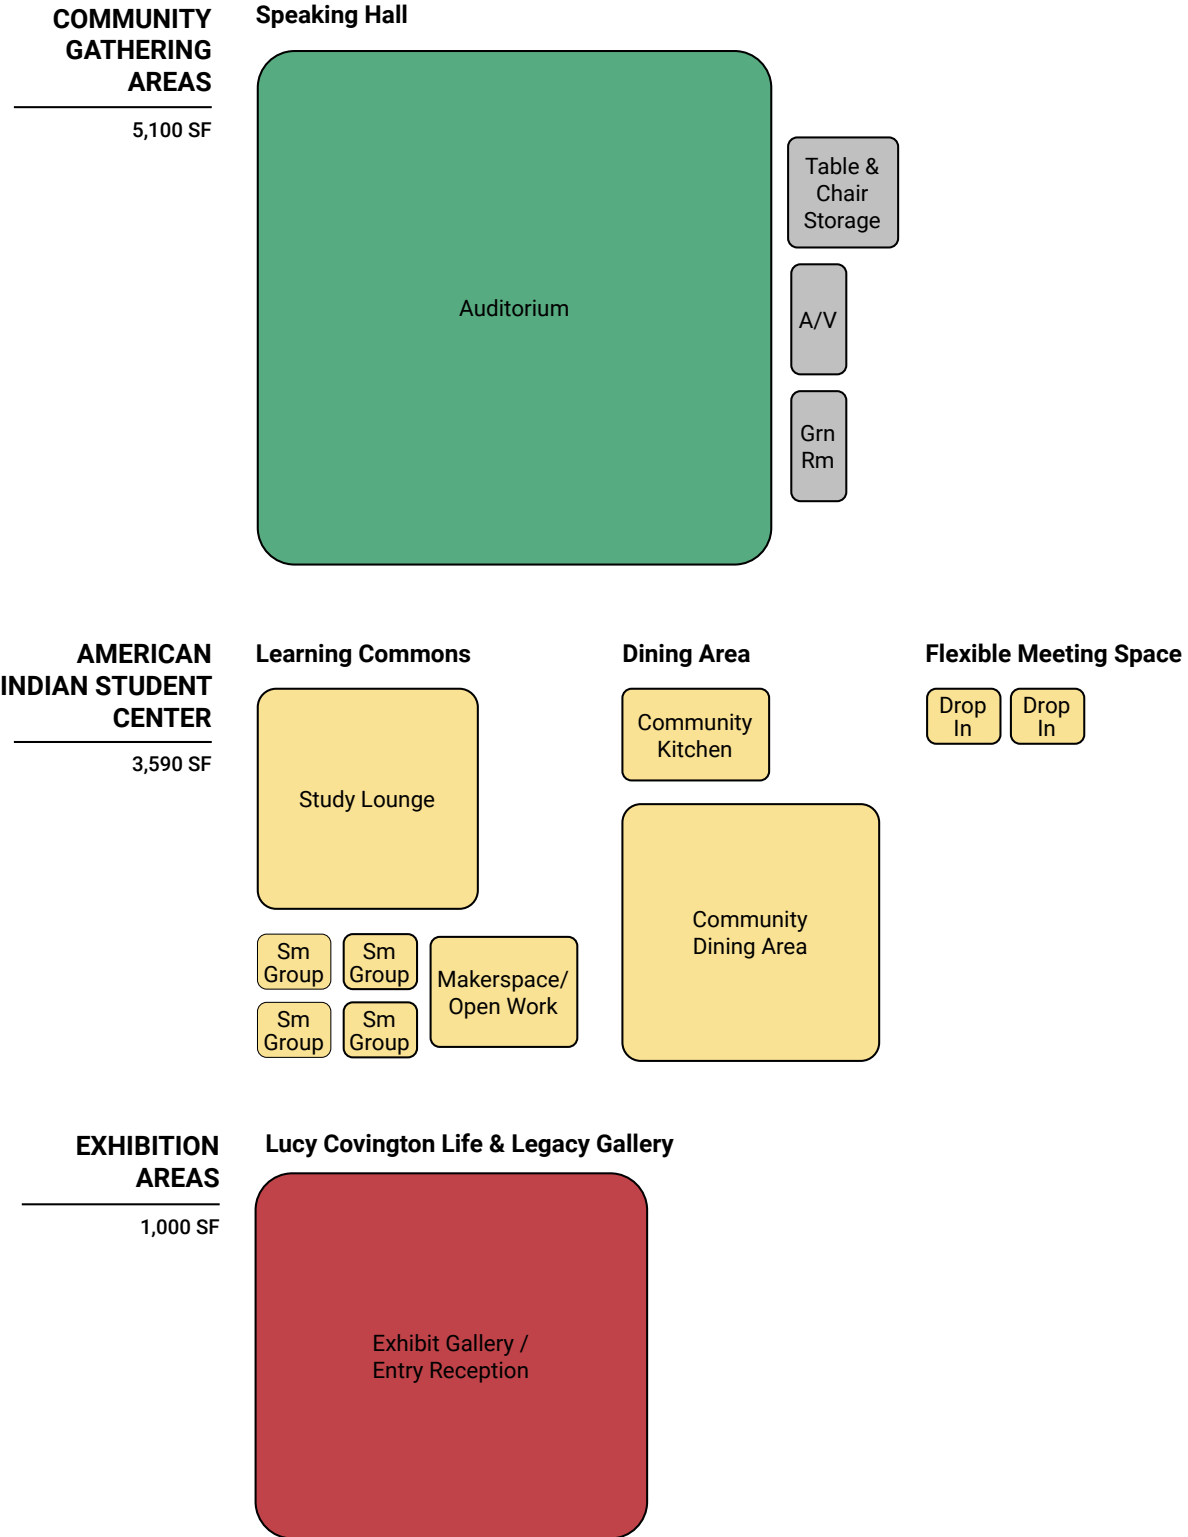

knowledge to younger generations of American Indians. A portion of the makerspace area will integrate a flexible computer lab to support and accommodate digital projects and general homework needs.

#### Community Kitchen and Dining

The Community Kitchen and Community Dining areas will serve as a focal point of the building. The kitchen will be available for use by students that are in the facility, as well as serving as a catering kitchen for functions in the building and a teaching kitchen for traditional cooking.

The dining area will accommodate up to 50 people in a variety of table seating configurations. Adjacency between these areas and the Speaking Hall will allow them to open and be used simultaneously for large functions. These

DIAGRAM:  
Program Areas

**TABLE:**  
**Building Occupancy Summary by Function**

spaces will also open to an outdoor courtyard designed to provide visual privacy.

### Flexible Meeting Space

Two flexible meeting rooms will accommodate student functions including private and group study, drop-in counseling, and Temporary Assistance for Needy Families (TANF) counseling.

## EXHIBITION AREAS

### Lucy Covington Life and Legacy Gallery

Part of Lucy Covington's essence was her warmth and welcoming persona, which will be conveyed in the exhibit gallery / entry lobby, providing an opportunity to tell the story of her achievements and capture her warmth for everyone who enters the building. The Lucy Covington Life and Legacy Gallery will empower American Indians visiting and using the building and educate non-Native students and visitors about the history and importance of Lucy Covington's work and the history of regional tribes. This program area sets the tone for the building as a teaching tool.

Displays of local and regional tribal leaders can also be dispersed throughout the building, showcasing the diversity of tribal histories and styles. Various displays should be curated to teach through storytelling, such as using stills in combination with narration, analog displays open to visitors' comments, interactive storytelling.

Design and displays should consider the use of natural earth elements- circles, feathers, water, animals, geometric shapes, pictographs, earth tones etc. An iconic/symbolic element such as the Eagle Feather could be an interactive feature that accommodates self-reflection and personal storytelling. Losing Eagle Feather represents losing land, which embodies the essence of Lucy Covington's political fight and work.

| SPACE TYPE                                      | NSF           | Total OCC            | FEPG Category |
|---|---------------|----------------------|---------------|
| <b>COMMUNITY GATHERING AREAS</b>                |               |                      |               |

| <b>Subtotal: Exhibition Areas</b>               | <b>1,000</b>  | <b>40</b>            |               |
| <b>Total Assignable Areas</b>                   | <b>9,690</b>  |                      |               |
| <b>Total Unassignable Areas</b>                 | <b>5,310</b>  |                      | 700           |
| <b>Total Building Area</b>                      | <b>15,000</b> | <b>541 occupants</b> |               |

## A.2 OCCUPANCY

The Preferred Alternative provides space for 541 total occupants in the building, including 347 occupants in community gathering areas and 194 occupants in the American Indian Student Center.

The table above identifies occupancy counts for each space type and building area.

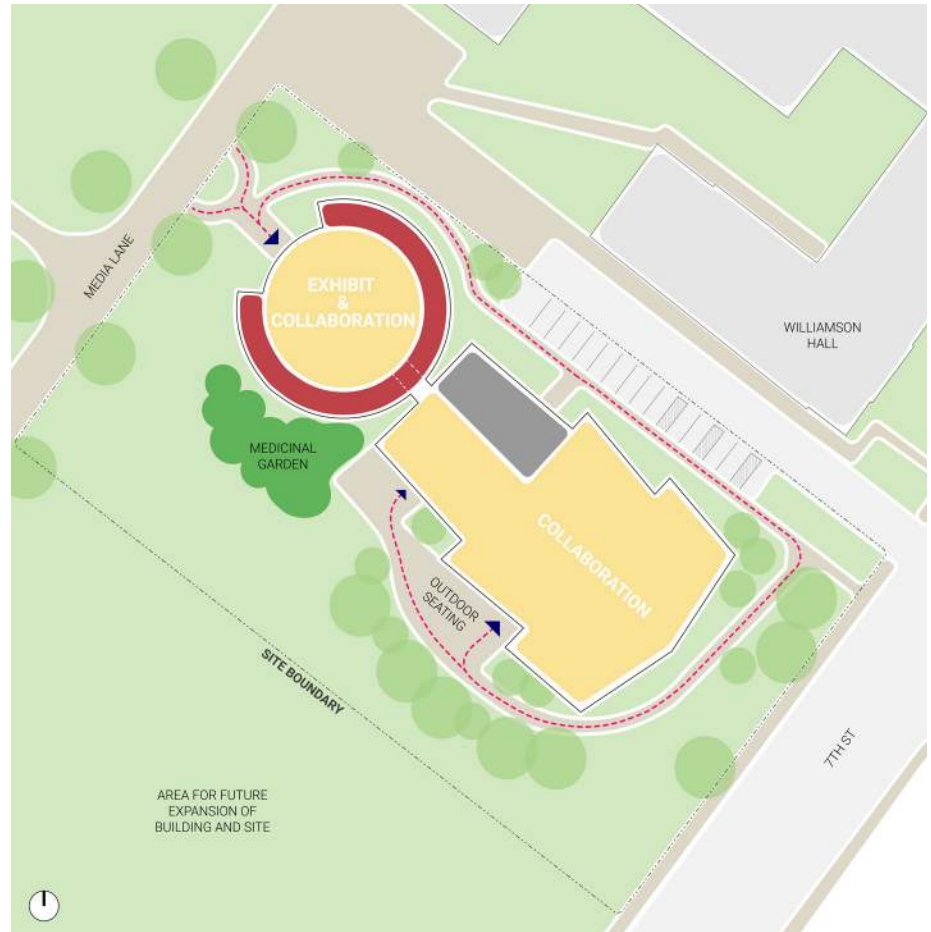

### CONCEPTUAL PLAN DIAGRAM: Preferred Alternative

## A.3 CONCEPTUAL BUILDING CONFIGURATION

The following description summarizes the conceptual thinking regarding building design and configuration but does not represent a final design for the building. This information is used as the basis of the predesign cost estimate and to highlight potential opportunities and challenges of the project. It is anticipated that the design team will develop the final building design in alignment with project goals, program, and budget once funding is approved.

The building form is intended to be a tribute to the tradition and culture of the Indigenous people inhabiting the Plateau. The cultural influence on the design concept in this Predesign study was a Seasonal Rounds. In practice, the weather pattern changes are significant in the Plateau Region and are indicators of the natural resources and activities change throughout the year. It is envisioned that the activities, performances and exhibits that will be held within the gallery space will reinforce this concept of seasonal change. The soft radius of this Seasonal Rounds inspired shape also defines a unique building entry on campus. The adjacent volume to the round drew inspiration from a longhouse and be configured to host community and cultural gatherings.

The Lucy Covington Leadership house is envisioned to provide a home away from home to American Indian students, who often must commute great distances from their reservations to attend EWU. It would be home for American Indian students to feel safe for their self-exploration and self-understanding of their values, identities, cultural heritages.

### BUILDING CONFIGURATION

The Preferred Alternative concept for the Lucy Covington Leadership House is a 15,000-square-foot, one-story building. The main building entry is located off the major pedestrian thoroughfare.

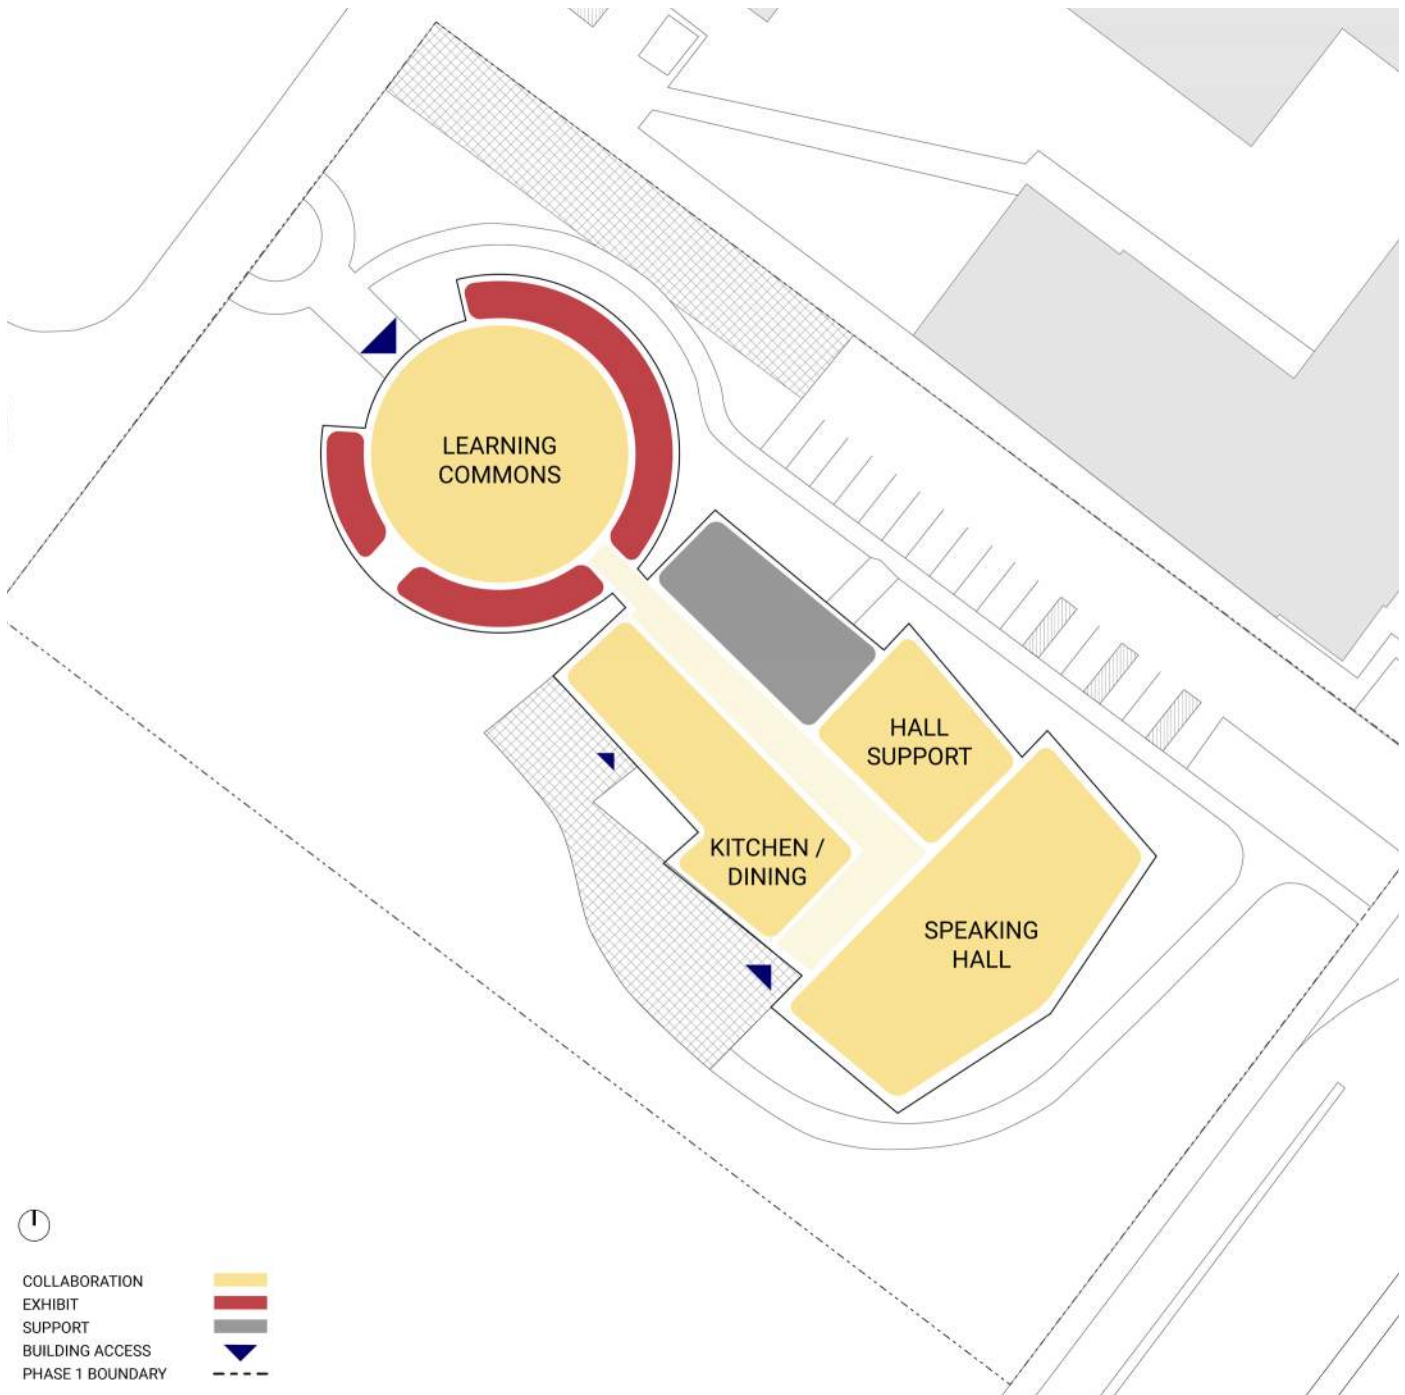

Through the vestibule, students will be welcomed into the Learning Commons, a circular lounge and student support area. This area is designed for group gatherings and collaborative activities, but also includes contemplative spots that provide areas for focused study and respite. It is surrounded by an exhibit area that will showcase Lucy Covington's life and tribal cultures.

The Learning Commons' double-height volume will integrate a skylight that will not only enhance natural light, but also provide a visual link between the sky, the occupants, and the earth,

connecting building users to the natural environment.

From here, a longhouse-inspired volume can be accessed, which will be used for more formal gathering. This area contains the Speaker Hall at the south end, as well as centrally-located community kitchen and dining areas, a makerspace, and the main service core, including restrooms and building system areas.

The longhouse is situated between the more public access road, facing Martin and Williamson Hall, and the private courtyard area. The south and southwest edges of the site will use land sculpting to create earthen berms. These will provide screening and casual places to sit during events, as the dining area and Speaking Hall will open onto these areas and create a more seamless indoor/outdoor experience.

The layering of types and sizes of exterior gathering areas is intentional so that the building's most private space is an area set aside for a self-constructed traditional sweat lodge.

**PROGRAM CONFIGURATION**

The floor plan of the building is anticipated to contain a vibrant mix of

program areas. Spaces are organized from most public to those serving more private functions. Starting from exhibit and study lounge areas, followed by meeting and maker spaces, to communal dining and speaking hall.

The circular exhibit space will not only be utilized for exhibition, but also for sharing indigenous culture through storytelling,

performance art, and film. The nature of circular space diminishes the hierarchy and lends itself to communal activity and building strong connections. The informal seating and gathering areas, along with the dedicated meeting rooms, are encouraged to be visible from the main campus thoroughfare, while also activating the interior of the building.

**IMAGE:**  
Existing American Indian Education Center,  
EWU Campus

## A.4 SPACE NEEDS ASSESSMENT

### PROGRAM DEVELOPMENT PROCESS

The Steering Committee provided a preliminary guideline program that was used as a starting point for predesign. Further program development was derived from an analysis of building users' needs, overlaid with the preliminary program. Information was gathered through visioning sessions with the Steering Committee, American Indian Studies program faculty, and Native American Student Association (NASA).

The design team also utilized historic program information from similar projects to establish physical facility square footage requirements. An initial "ideal" numeric program evolved from this process, outlining the desired spaces. This initial program was refined to align with the allowable program size accommodated by the allocated budget, through efficient use of space and implementation of shared usage wherever possible, while still providing necessary program functions.

Program reduction strategies included combining meeting areas, incorporating computer stations within the makerspace rather than in a separate room, and a general increase in the efficiency of the building. Desired instructional programs were not included in the Preferred Alternative program, due to lack of staffing for these programs. These instructional programs were included as part of a future expansion of the building.

The resulting building program, at 15,000 GSF, aligns with a lower budget and achieves project goals.

### IDENTIFIED NEEDS ADDRESSED IN THE PREFERRED ALTERNATIVE

Existing campus facilities do not provide the space that is needed to support the Lucy Covington Initiative and address underrepresentation and declining enrollment of American Indian students in higher education.

EWU's American Indian Education Center, shown above, houses instructional space dedicated to the American Indian Studies program and includes one room that is currently used as a student study area. While this building is significant to EWU alumni of American Indian heritage, it does not meet current student needs, support the goals of the Lucy Covington Initiative, or address underrepresentation and declining enrollment of American Indian students in higher education as follows:

- > The limited amount of space does not accommodate the current number of American Indian students or provide needed functions.
- > The existing building is not centrally located on campus, further emphasizing the lack of visibility for American Indian students.
- > The building is not reflective of indigenous culture, in its configuration or materials, as it was originally designed as a church.

- > The building has very limited accessibility. The main accessible entry is on the back side of the building, creating an inequitable experience to students, faculty, or visitors with mobility impairments.
- > The interior space students currently use the most is located in the basement and lacks natural light, impacting student wellbeing.

There is no existing space dedicated to celebrations of indigenous cultures and traditions on campus. EWU's annual Spirit of Eagle Powwow is currently held in the campus fieldhouse, which limits food preparation and is not representative of American Indian identity and culture.

The new Lucy Covington Leadership House will provide intentional and dedicated areas directly supporting the Lucy Covington Initiative and addressing the issues of underrepresentation and declining enrollment. Program areas that will support functions not currently provided on campus include:

- > Speaking Hall
- > Learning Commons
- > Dining area with community kitchen
- > Makerspace / open work area
- > Flexible meeting space
- > Lucy Covington life & legacy gallery

**TABLES:**  
**Numeric Space Program Summary (Top)**  
**Program Comparison to Guidelines (Bottom)**

**NUMERIC SPACE PROGRAM**

The proposed program for Lucy Covington Leadership House, summarized above, allocates 15,000 GSF for the building. This accommodates 9,690 square feet of assignable area, including Community Gathering Areas, Exhibition Areas, and an American Indian Student Center.

The program has a 65 percent efficiency ratio, indicating that 65 percent of the total building area is allocated for assignable program functions and 35 percent is allocated for building services, building systems, circulation, and walls.

A detailed numeric space program for Lucy Covington Leadership House is included in Appendix D.

**PROGRAM COMPARISON TO GUIDELINES**

Proposed program areas for the Lucy Covington Leadership House align with, or are more efficient than the State guidelines, as shown in the bottom table.

Other required facilities in the State Facilities Workplace Strategies and Space Use Guidelines provided in the proposed program include a Wellness room, required for facilities over 5,000 GSF.

**PREFERRED ALTERNATIVE**

| PROGRAM AREA                               | NSF             | % of NSF      |
|--|-----------------|---------------|
| <b>COMMUNITY GATHERING AREAS</b>           |                 |               |
| Speaking Hall                              | 5,100           | 52.6%         |
| <b>AMERICAN INDIAN STUDENT CENTER</b>      |                 |               |
| Learning Commons                           | 1,800           | 18.6%         |
| Dining Area                                | 1,550           | 16.0%         |
| Flexible Meeting Space                     | 240             | 2.5%          |
| <b>EXHIBITION AREAS</b>                    |                 |               |
| Lucy Covington Life & Legacy Gallery       | 1,000           | 10.3%         |
| <b>Total Assignable Square Feet (NASF)</b> | <b>9,690</b>    |               |
| <b>UNASSIGNABLE AREAS</b>                  |                 |               |
|  | <b>% of GSF</b> |               |

| Building Systems                           | 8.0%            | 1,200         |
| Circulation / Walls                        | 21.3%           | 3,200         |
| <b>Subtotal - Unassignable Areas</b>       | <b>35.4%</b>    | <b>5,310</b>  |
| <b>Total Building Area</b>                 |                 | <b>15,000</b> |
| <b>Building Efficiency</b>                 |                 | <b>65%</b>    |

| Program Area        | FEPG Guidelines  | Space Use Guidelines | Project Program |
|---------------------|------------------|----------------------|-----------------|
| Offices             | 120-175 SF each  | 100-150 SF each      | 120-150 SF each |
| Instructional Areas | 16-20 SF/station | n/a                  | 30 SF/person    |
| Conference Rooms    | 20 SF/person     | 15 SF/person         | 20 SF/person    |
| Collaboration Space | 25-35 SF/person  | 20 SF/person         | 20 SF/person    |
| Assembly Space      | 15-16 SF/person  | n/a                  | 15 SF/person    |

**IMAGE:**

**Aerial View of Project Site and Surrounding Area, EWU Campus**

## B. SITE ANALYSIS

### B.1 SITE STUDIES THAT ARE COMPLETED OR UNDERWAY

Eastern Washington University will be updating its Campus Master Plan in the Fall of 2024 and targeting its completion in the Fall of 2025. As EWU moves forward with updating their Campus Master Plan, future projects such as the Lucy Covington Leadership House will need to align with the revised vision and objectives outlined in that plan.

### B.2 PROJECT SITE INFORMATION

#### LOCATION

The site selected for this Pre-design study is located at the southeast edge of the EWU campus in Cheney, Washington. It is the former site of Robert Reid Lab school, which has been demolished and the site cleared in 2015. The site abuts a residential neighborhood on the other side of 7th Street.

To the northwest the site is bounded by Media Lane, a major pedestrian thoroughfare parallel to 7th Street. The large deciduous trees lining Media Lane will contribute to a project's biophilic design, provide shade in the warmer months, and allow for additional visual connectivity to the campus core during fall and winter months. On the northeast edge of the site, the Lucy Covington Leadership House building will sit parallel to Martin and Williamson Hall.

### FOOTPRINT, ADJACENCIES, & SITE FEATURES

The proposed building will be a one-story freestanding structure with a footprint of approximately 15,000 square feet. The building will occupy 25 percent of the total site area of 60,000 square feet. The site is relatively flat and covered with sparse grass. The new building will share a new access road with Martin and Williamson Hall, which will be included in the scope of the renovation of that building. Parking on the site is proposed to accommodate about sixteen stalls, including electric charging stalls and accessible parking stalls. It will also provide delivery access to the building.

#### Circulation

The major pedestrian pathway is along Media Lane, which diagonally connects the campus gateway by Isle Hall and the Art and Computer and Engineering Buildings located at the south end of campus.

Commuters arriving by bus will most commonly enter the campus via Mall Lane from Eagle Station on Elm Street. Many students, faculty, and staff arrive at EWU campus by personal vehicle. In this case, the most common entry point to campus is from Washington Street, but also off 7th Street, or via Study Lane or Quad Lane (which turns into Media Lane, bypassing our site).

Fire and service access are provided along 7th Street, Media Lane, and the new access lane shared with Martin and Williamson Hall.

### **PREFERRED ALTERNATIVE SITE CONCEPT**

During the stakeholder engagement process, this site was deemed as preferred location by the members of the Native American Student Association (NASA) over other considered site locations. The abundant outdoor space would give the building room to breathe and accommodate the many possible outdoor programs and connections that the new Center would offer. Outdoor events and gatherings should be taken into consideration for future development and by the Campus Master Plan. Choosing this prominent location on campus was of a crucial importance for elevating the visibility, presence, and importance of American Indian students and faculty members at EWU.

Based on circulation patterns, the chosen site is optimally located. The building is envisioned not only as a destination but also as a connector between the Art building and the campus core. It is also a short walking distance from the EWU's Visitor Center, Arevalo Campus Mall, and Pence Union Building.

### **WATER RIGHTS & WATER AVAILABILITY**

Eastern Washington University (EWU) provides drinking water from two drilled wells, both of which draw from a groundwater aquifer. Well 1R is located in the Plant Utilities building and can pump up to 450 gallons per minute at a depth of 834 feet. Well 2R produces 900 gallons per minute at a depth of 1145 feet.

Chlorination of the campus water supply began in 2010. Since 2016, water from both wells has been routed through a new chlorine building for treatment before being distributed throughout campus via the tower. To ensure the safety of the tap water, backflow assemblies are installed through the campus to protect the water system. Two Cross Connection Control Specialists and three Backflow Assembly Testers, employed by the university, conduct tests on all assemblies annually and perform any necessary repairs or replacements. A report is submitted to the Department of Health each year.

The water supply meets or exceeds all standards set for quality and safety, and EWU is committed to providing safe, high-quality water. EWU's annual drinking water report can be found at <https://inside.ewu.edu/facilities/water/>.

### **STORMWATER REQUIREMENTS**

The proposed facility will follow the Stormwater Management Manual for Eastern Washington to meet the requirements for conveyance, flow control, and water quality treatment. It is anticipated that all stormwater will infiltrate on site but rainwater harvesting may be used towards additional LEED points. A small amount of pollution-generating impervious area, a small parking lot with an access road that will be shared with the adjacent Martin and Williamson Hall site, will be conveyed to a bio infiltration swale for water quality treatment. The bio infiltration swale will also be used for collecting the roof runoff from the building. Catch basins and piping will collect the runoff from the building and hard surface and be routed to the bio-infiltration swales.

### **OWNERSHIP OF THE SITE**

The Lucy Covington Leadership House will be located on the EWU campus, on land that is owned by Eastern Washington University. There are no acquisition issues related to this project.

### **PROPERTY SETBACK & EASEMENT REQUIREMENTS**

The project site is located in in Public (P) Zone which is applicable to the entire EWU campus. It is totally within the existing campus, with frontage on 7th Street to the southeast. The project will adhere to the setbacks specified by the City of Cheney and the building separation requirements of the current building code.

### **NEIGHBORHOOD ISSUES**

Establishing and maintaining effective communication with the campus neighbors, beginning in design, and continuing through construction, will be important given the proximity of the proposed project location adjacent to the campus boundary. As part of its construction best practices, EWU will implement communications plans and protocols to inform neighbors of construction activities and manage any communications, concerns, or complaints that may arise during construction.

### **UTILITY EXTENSION OR RELOCATION ISSUES**

The existing site currently has water and sewer service stubbed to the site as there was an existing building in the northeast corner of the lot that has been removed. The old water and sewer lines that went to an existing building will need to be removed / abandoned. There are existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building.

It is assumed the building will have fire sprinklers and will need a fire service line as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design. There also is an existing utility tunnel under the existing concrete sidewalk as well as abandoned cable lines near the site.

Existing onsite power: The proposed project site is currently serviced by Avista through underground electrical. The campus Electrical Distribution Upgrades Ph. 2, Termination Pt. #11A above grade, brings a high voltage switch location directly to the proposed Lucy Covington Leadership House site. A new feeder from the existing electrical distribution upgrade Ph. 2 at termination Pt. #11A will be installed to serve the new building. Transformer location to be coordinated during the design phase.

The utility will coordinate burial of remaining electrical overhead services and/or relocation of underground electrical. Avista and Eastern Washington Campus Officials will verify acceptable design.

### POTENTIAL ENVIRONMENTAL IMPACTS

There are no known existing environmental issues on the preferred site that need to be mitigated.

### PARKING AND ACCESS ISSUES

The campus is well served by an existing vehicular circulation network. No significant roadway or signalization improvements are anticipated on- or off-campus, given no increase in FTE capacity generated by the Lucy Covington Leadership House. Parking quantities are managed on a campus-wide basis based on periodic analysis of parking demand and use patterns.

Approximately sixteen visitors, delivery, and accessible parking stalls will be accommodated within the access road the building will share with Martin and Williamson Hall.

### CONSTRUCTION IMPACT

Eastern Washington University has demonstrated success at managing complex construction projects in its campus core and mitigating diverse impacts to surrounding areas with

multiple construction projects. Establishing adequate laydown areas, coordinating deliveries, traffic control, and contractor parking, and managing construction noise impacts, all with an emphasis on ensuring the safety of the campus community and construction workers, as well as surrounding neighbors are proven keys to success.

The following surrounding uses will be impacted during construction:

- > Adjacent area between the site and Arts Building will be used as lay-down area during construction
- > Utility installation/relocation along Media Lane and site lighting updates will have an impact on pedestrian use of Media Lane.
- > Mature trees along Media Lane will need to be protected during construction.
- > A new access road from 7th Street which will edge the project and Martin and Williamson Hall will be impacted, but fire access to JFK Library will be planned for.
- > The Drop-off area along 7th Street will be utilized by construction vehicles.

## C. CONSISTENCY WITH APPLICABLE LONG-TERM PLANS

Eastern Washington University will be updating its Comprehensive Campus Master Plan (CCMP) in the Fall of 2024 and targeting completion in the Fall of 2025. As EWU moves forward with updating its CCMP, future projects such as the Lucy Covington Leadership House will need to align with the revised vision and objectives outlined in that plan.

## D. CONSISTENCY WITH OTHER LAWS & REGULATIONS

### D.1 HIGH-PERFORMANCE PUBLIC BUILDINGS (CHAPTER 39.35D RCW)

EWU implements environmental stewardship and sustainability principles in the development and management of their buildings and capital projects. Sustainable design includes efficient management of energy and water resources, management of materials and waste, protection of health and indoor environmental quality, protection of the environment and reinforcement of natural systems, and an integrated design approach. Sustainability encompasses design, construction, operations, and demolition practices, as well as environmental, economic, and social impact.

State-funded higher education projects will be designed, constructed, and certified to at least the Leadership in Energy and Environmental Design (LEED) Silver standard under the v4.1 New Construction pathway. Lucy Covington Leadership House will achieve at least LEED Silver certification but has the goal of achieving LEED Gold. By designing to the LEED Silver or Gold standard, the College will reduce lifecycle costs (as required by OFM), thereby increasing both environmental and financial sustainability.

In addition to lowering operating costs, high-performance buildings as described in RCW 39.35D should also make occupants more productive, reduce worker absenteeism, and bolster well-being. The use of decoupled ventilation and conditioning strategies with a dedicated outside air system (DOAS), also known as energy recovery ventilators (ERV), can create healthier buildings while reducing energy use.

These systems operate with the core intent of ensuring a well-ventilated environment for student learning success. Studies have demonstrated that good ventilation is key for occupants' ability to focus and maintain concentration, while also reducing air borne pathogens to keep spaces hygienic and healthy. Both MERV 15 and carbon filtration should be employed to ensure high indoor air quality, even during forest fire seasons.

A detailed summary of the sustainability charrette that included the predesign team and EWU and outlined major sustainability strategies is included in the section 07 Supplemental Appendices.

## D.2 STATE EFFICIENCY & ENVIRONMENTAL PERFORMANCE REQUIREMENTS (EXECUTIVE ORDER 20-01)

Washington State's Executive Order 20-01 states that all newly constructed state-owned (including lease-purchase) buildings shall be designed to be zero energy or zero energy capable and include consideration of net-embodied carbon.

EWU has expressed strong interest in net zero renewable energy. Enhanced goals to achieve net zero are to be further assessed during the design phase, taking into account cost effectiveness, space constraints and environmental impact. Cost effective is defined as a simple payback of less than five years or a life cycle cost less than the baseline. A life cycle cost analysis (first cost, energy, operations, maintenance, replacement, productivity), is not necessary for measures with simple paybacks less than five years.

Electrification of the building is a key strategy to achieving net zero energy and operational carbon emissions. As the electrical grid adopts greater percentages of renewable energy sources (wind, solar, hydro, etc.), a path to decarbonize the built environment is electrification. The 2021 Washington

Energy Code will require electrification for buildings of this size and occupancy for HVAC systems and partial electrification of building domestic hot water. This will be accomplished for this project through heat pump technology via a centrally located ground source.

New buildings larger than 10,000 square feet of gross conditioned floor area, will include a renewable energy generation system consisting of not less than 0.5 W/ft<sup>2</sup> or 1.7 Btu/ft<sup>2</sup> multiplied by the sum of the gross conditioned floor area. Washington State Energy Code 2021 edition, 51-11c WAC section C411.

Based on a 15,000 GSF footprint, the solar design will need to generate 7.5kW of renewable energy. It can be anticipated to be a minimum of \$93,000.00

## D.3 STATE ENERGY PERFORMANCE STANDARDS FOR CLEAN BUILDINGS (RCW 19.27A.210)

The Lucy Covington Leadership House building project comprises less than 50,000 gross square feet of construction and is thus not a 'Covered Commercial Building' nor bound by the requirements of RCW 19.27A.210.

## D.4 ELECTRIC VEHICLE INFRASTRUCTURE (RCW 12.27.540)

Parking quantities, including number and location of electric vehicle charging stations, are managed on a campus-wide basis based on periodic analysis of parking demand and use patterns.

No additional parking will be required as part of the Lucy Covington Leadership House project, however both traffic and parking impacts will be confirmed during design process including an assessment of compliance with RCW 19.27.540.

Per RCW 19.28, where new parking is provided at the building, electric vehicle charging stations and infrastructure shall be provided in compliance with WAC 51-50-0429. The electric vehicle charging stations and infrastructure shall meet Level 2 charging capacity requirements with each charger rated for 40 amps at 208V, 1PH. Charger locations will be coordinated to not conflict with campus snow removal operations.

## D.5 GREENHOUSE GAS EMISSIONS REDUCTION POLICY (RCW 70.235.070)

EWU will reduce greenhouse gas emissions to meet and exceed the goals passed by the Washington State Legislature in April of 2009, requiring Washington State agencies reduce emissions 15 percent below 2005 levels by 2020, and 36 percent below 2005 levels by 2035. Based on their Climate Action Plan, EWU is targeting 45 percent reduction by 2030, 70 percent reduction by 2040 and 90 percent reduction by 2050. In addition, EWU is currently under contract with an engineering consulting firm to conduct a 15-year decarbonization plan that will provide a pathway(s) to transition the campus away from the use of fossil fuels for building heating, compliance with the Clean Buildings Performance Standard, and guide the new campus masterplan to prioritize sustainability in the built environment.

To achieve the GHG targets, EWU must accelerate increases in energy efficiency and reductions in GHG emissions. The nearer-term 2030 reduction target is likely achievable through available technologies and practices. Strategies for the 2030 target include:

- > Invest in infrastructure improvements to reduce energy use and GHG emissions
- > Support facilities personnel in the sustainable management and maintenance of campus
- > Use existing space efficiently

- > Avoid increasing total campus square footage
- > Carbon sequestration through the Prairie Restoration Project and management of the campus landscape
- > Install electric vehicle infrastructure for both university operations and public use
- > Electrify vehicle fleet and maintenance equipment
- > Establish a University Sustainability Committee to build stakeholder engagement and help guide EWU towards sustainable practices

As EWU looks to 2040 and 2050, the reduction targets become more challenging to plan for strategically. To achieve a 70 percent reduction in GHG, and ultimately carbon neutrality, EWU may need to utilize technologies that are not yet available at appropriate scales. These technologies may be those that are currently cost prohibitive, unproven at scale, or still in the early stages of development.

EWU can begin to anticipate potential solutions and review opportunities, but have not set a specific pathway. Therefore, current planning for 2040 and 2050 is to assess and evaluate all carbon reduction options and find sustainable solutions. Strategies for these longer-range targets include:

- > Work with EWU staff, faculty, and students to propose, research, and evaluate GHG reduction strategies
- > Collaborate with industry experts to identify opportunities to transition EWU off of natural gas
- > Investigate the role of carbon capture/sequestration from point source GHG emissions
- > Electrify where possible
- > Track and review emerging technologies/practices to reduce GHG emissions.
- > Remain open to the dynamic and evolving changes in sustainable practices and technologies to achieve the long-term carbon reduction goals

EWU's Greenhouse Gas Emission Reduction Plan incorporates multiple strategies for reducing the campus's carbon footprint. Lucy Covington Leadership House will be designed in accordance with this plan's principles and will incorporate at least eleven of the best practices to reduce greenhouse gas emissions.

When considering greenhouse gas emissions, it is also important to look at the whole life cycle carbon of buildings. This includes not only operational energy, but also refrigerant emissions, emissions from material production, and end-of-life impacts. Reducing overall emissions means minimizing operational energy use while also finding carbon sinks for projects, such as biogenic carbon from sustainably harvested wood, site landscaping, biochar, or other materials.

The use of mass timber products, such as cross-laminated timber (CLT), sequesters large amounts of carbon. Extensive research into mass timber has demonstrated that this construction type can not only reduce embodied carbon emissions by some 80 percent compared to other construction types, but it is also fast to build, fire resistive, supports local economies, and creates a healthy interior environment.

## D.6 DAHP AND TRIBAL NOTIFICATION LETTERS

As required by Executive Order 05-05, the University requested review of this project by the Department of Archaeology and Historic Preservation (DAHP) and local tribes.

The tribes that Eastern Washington University contacted fall within the federally recognized tribes of Washington and Idaho, as well as the Washington State Tribal Reservations and Draft Treaty Ceded Areas. Three tribes were contacted: the Confederated Tribes of the Colville Reservation, Spokane Tribe of Indians, and the Coeur d'Alene Tribe. Correspondence and status of communications with DAHP and local tribes are included in Appendix C.

The University will comply with requirements of the Governor's Executive Order and consult with DAHP to review the project as required for state-funded projects.

The Lucy Covington Leadership House is not anticipated to affect cultural or historic resources; however, EWU will continue to coordinate with DAHP through design to avoid or mitigate potential effects.

## D.7 AMERICANS WITH DISABILITIES ACT IMPLEMENTATION (EXECUTIVE ORDER 96-04)

The proposed project will comply with International Code Council (ICC) ANSI A117.1-2009 with Washington State Amendments - WAC 51-50. In addition to the ADA accessibility codes, the proposed facility will comply with the Revised Code of Washington (RCW) and Washington administrative code (WAC) requirements for barrier-free facilities, and the accessibility provisions of the Washington State amendments to the International Building Code.

## D.8 GROWTH MANAGEMENT ACT COMPLIANCE (RCW 36.70A)

The Growth Strategies legislation of 1990 requires state agencies to comply with local land use regulations adopted pursuant to the Growth Management Act, which EWU acknowledges through the development of 2014 Campus Master Plan (due to be updated in 2024-2025). Environmental regulations, including the Growth Management Act and local, state, and federal laws and regulations (such as shoreline and wetlands), will be met. The project will comply with all planning regulations as required by RCW Chapter 36.70A.

## D.9 INFORMATION REQUIRED BY RCW 43.88.0301(1)

The Lucy Covington Leadership House project is consistent with the EWU Campus Master Plan. No changes are proposed to the Campus Master Plan as a result of this project. This plan is consistent with City of Cheney zoning and Growth Management Act regulations.

## D.10 OTHER CODES OR REGULATIONS

All construction will comply with the applicable version of the International Building Code that is adopted by the State of Washington and the City of Cheney at the time of permit intake, as well as its reference documentation:

- > International Building Code (IBC) and Amendments – Chapter 51-50 WAC
- > International Mechanical Code (MBC) and Amendments – Chapter 51-52 WAC
- > International Fire Code (IFC) and Amendments – Chapter 51-54 WAC
- > Uniform Plumbing Code (UPC) and Amendments – Chapters 51-56, 51-57 WAC
- > Washington State Energy Code (WSEC)
- > National Electric Code (NEC)
- > Washington State Electrical - Chapter 296-46B WAC
- > Energy Codes

The 2021 Washington Energy Code or subsequently adopted version will govern the design of the new Lucy Covington Leadership House Building. RCW 39.35 requires a life cycle cost analysis of energy costs be conducted when designing a facility of this size, including analysis of building envelope, HVAC, power, and lighting.

## E. PROBLEMS THAT REQUIRE FURTHER STUDY

There are no known problems that require further study.

## F. COMPONENTS THAT EXCEED EXISTING CODE

There are no known proposed components that exceed existing code.

## G. PLANNED TECHNOLOGY INFRASTRUCTURE INVESTMENTS

The Eastern Washington University is exploring a New Geothermal Heating Plant, in addition to existing Physical Chilled Water Plant. EWU has invested heavily in this chilled water plant over the years, and it has the available capacity to serve this new Lucy Covington Leadership House building. In addition, there are pipe mains extremely close to the proposed building footprint. The project team will make use of this available source. In addition, the goal is to explore utilizing approximate 120 degree heating water for the new geothermal heating plant to reduce carbon footprint and reduce fossil fuel load of current campus steam system. New direct bury piping or tunnel construction will be required from central geothermal plant to proposed mechanical room location.

## H. PLANNED SECURITY MEASURES

The Preferred Alternative includes the following planned security measures:

- > Door hardware shall have access controls with remote lockdown capabilities.
- > A blue phone is recommended in the near vicinity of the building. Blue

phones on campus are used for mass notification and include infrastructure for video surveillance.

- > The Fire Alarm system will also have a mass notification system.

Building access and security will be managed in a similar manner as existing adjacent academic buildings

## I. COMMISSIONING

Systems commissioning, per Washington State requirements and EWU standards, will be incorporated into the project for all applicable systems. Enhanced Commissioning, requiring establishment of commissioning requirements early in the design phase, is recommended to ensure increased effectiveness of the process, and would earn LEED credit. Refer to Appendix D Electrical scope for more detailed information on Commissioning.

## J. FUTURE PHASES OR FACILITIES

Section 03A has a detailed review of the future expansion alternative. This expansion would add approximately 13,000 gross square feet to the proposed design. It would include additional office and instructional program, allowing potential expansion and/ or relocation of the American Indian Studies program.

**TABLE:**  
**Proposed Project Schedule**

## K. PROJECT MANAGEMENT & DELIVERY METHODS

### K.1 PROJECT DELIVERY METHODS CONSIDERED

Eastern Washington University intends to employ the traditional Design/Bid/Build approach for this project. Previous major capital projects at EWU have been successfully executed within or under the allocated budget using this method. Its cost-effectiveness aligns well with the regional context and the construction administration capabilities available to EWU. Currently, there is no compelling reason for EWU to seek approval for an alternative delivery method under RCW 39.10.

### K.2 PROJECT MANAGEMENT WITHIN THE AGENCY

Eastern Washington University's Construction and Planning Division will manage all aspects of the project from programming and initial budgeting of the proposed project to the initial selection of the project architect/engineer(A/E) consultant design team and throughout the subsequent design, bidding, construction, commissioning, and warranty phases.

The Construction and Planning Division will oversee the required contractual administration for the project A/E consultants and public works contractors. The Construction and Planning team is responsible for working closely with the university's administration, the design team, and the contractors to ensure the project is delivered on time and within budget.

| Project Schedule: Preferred Alternative |          |               |               |
|---|----------|---------------|---------------|
| PHASE                                   | DURATION | START DATE    | END DATE      |
| Design / Construction Funding           |          | July 2025     |               |
| Design                                  | 12 mos.  | November 2026 | November 2027 |
| Construction                            | 12 mos.  | November 2027 | November 2028 |
| Move-In / FF&E                          | 3 mos.   | November 2028 | February 2029 |
| Occupancy                               |          | February 2029 |               |

## L. PROJECT SCHEDULE

### L.1 HIGH-LEVEL MILESTONE PROJECT SCHEDULE

The anticipated project schedule for the Preferred Alternative is shown above, and assumes design funding is awarded in the 2025-27 Capital Budget and construction funding is awarded in the 2027-29 Capital Budget.

Design is slated to start in November 2026, with construction beginning in November 2027 and reaching substantial completion by November 2028. Building occupancy is anticipated in February 2029.

### L.2 VALUE ENGINEERING & CONSTRUCTABILITY REVIEW

Value engineering analysis and constructability review will be integrated into the design process. Time for this effort has been factored into the proposed project schedule.

### L.3 SCHEDULE RISK FACTORS

There are no known unusual or extraordinary factors anticipated to pose a risk to the project schedule. During the design and construction phases, the project team will need to manage typical factors and processes that have the potential to impact schedule, such as entitlements and jurisdictional review time.

### L.4 PERMITTING, ORDINANCE, OR NEIGHBORHOOD ISSUES

Buildings on EWU's campus are subject to the governing codes of the City of Cheney. During the design process, the University and design team will meet with City officials as required to ensure the project conforms with all City requirements.

### L.5 JURISDICTIONAL PROCESS & COMMUNITY INVOLVEMENT

Regular engagement with the City of Cheney, to understand permitting requirements and identify any other ordinances that could impact schedule, will be arranged. The involvement of the stakeholders, such as a Steering Committee, American Indian Studies program faculty members, and Native American Student Association (NASA) members will continue throughout the design.

## SECTION 05

# PROJECT BUDGET ANALYSIS FOR PREFERRED ALTERNATIVE

## A. COST ESTIMATE

A construction cost estimate based on the Maximum Allowable Construction Cost (MACC) cost estimate was prepared by the consultant. The State of Washington's C-100 (2024) cost estimating model was used as the basis for this estimate, applying consultant and project management fees, contingencies, and escalation.

The Preferred Alternative project budget is \$20,739,000, escalated based on the proposed project schedule. A construction cost summary is included on the following pages.

The State of Washington Form C-100 summary, which includes project and construction costs, is included later in this section. Additional cost detail is included in Appendix B, Detailed Cost Model.

## A.1 MAJOR ASSUMPTIONS

The following assumptions were used as the basis for the construction cost estimate indicated below.

- > Design, Bid, Build delivery method is assumed.
- > Assumes a Q4, 2027 start and a 12-month schedule for the Preferred Alternative.
- > Estimate excludes soft costs such as design fees, permits, testing / inspections, construction change order contingencies, loose fixtures / furnishings and sales tax.

**TABLE:**  
**Construction Cost Estimate:**  
**New Construction**

## A.2 COST ESTIMATE SUMMARY

A summary of the construction cost estimate for the Preferred Alternative is shown below and on the following page. A detailed cost estimate is included in Appendix B.

### ESTIMATED COSTS SUMMARY

June 4, 2024

| Item   | Description                           | QTY    | UOM  | \$ / UOM      | Cost                 |
|--|---------------------------------------|--------|------|---------------|----------------------|
| 1  | BUILDING - PREFERRED OPTION           | 15,000 | BGSF | \$ 649.89     | \$ 9,748,406         |
| 2  | SITWORK                               | 60,000 | SGA  | \$ 29.77      | \$ 1,786,495         |
| 3  | General Conditions & Support Services | 12     | MO   | \$ 75,000     | \$ 900,000           |
| <b>Total Estimated Construction Cost (Today's Dollars)</b> |                                       |        |      |               | <b>\$ 12,434,902</b> |
| 4  | Escalation to Midpoint (Q2, 2028)     | 16.00% | on   | \$ 12,434,902 | \$ 1,989,584         |
| <b>Total Construction Cost (Escalated)</b>                 |                                       |        |      |               | <b>\$ 14,424,486</b> |

| ESTIMATE SUMMARY  |                             | Quantity      | Unit of Measure | Unit Cost       | Total Estimated Cost |

## C. OPERATIONS & MAINTENANCE REQUIREMENTS

### C.1 OPERATING BUDGET IMPACT

The projected annual operating budget for the first year of operation in FY2029 is \$234,900. The budget will cover utilities, groundskeeping, pest control and other site maintenance, along with general building maintenance that includes security and telecommunications support.

Other costs include building operation permits for the building and components, such as elevator and pressure vessels, and specialized maintenance service contracts, such as elevators and fire sprinkler testing. The budget will also include general management of the facility, moving costs for the first year, and subsequent moving expenses throughout the life of the building.

### C.2 CAPITAL & OPERATING COSTS

The first biennium at building occupancy is FY29-31. The operating and maintenance cost, including building preservation and replacement based on funding, is \$234,900 for FY29. Escalation from that point is assumed at 3.00 percent per year.

Total capital and operating costs for the five biennia amount to approximately \$2.7 million.

### C.3 MAINTENANCE & OPERATIONS AGENCY

The Lucy Covington Leadership House will receive EWU's current campus level of custodial services and building utilities maintenance. Current and future operations and maintenance costs will be funded from EWU's normal operations and maintenance funding.

Current campus operations and maintenance costs for FY24 are shown in Table 1 above. For the Lucy Covington Leadership House, the projected operations and maintenance costs for the first full year of occupancy (FY2029) are \$234,900. Table 2 shows projected costs for FY29 through FY38.

## D. FURNITURE, FIXTURES & EQUIPMENT

Estimated funds for furniture, fixtures, and equipment are included in the project budget.

# APPENDICES

- A. Predesign Checklist
- B. Cost Analysis
- C. DAHP & Tribal  
Correspondence
- D. Project Detail

[This page intentionally left blank for the purpose of double-sided printing.]

## SECTION 06 APPENDICES

### A. PREDESIGN CHECKLIST

#### B. COST ANALYSIS

- B.1 Form C-100
- B.2 OFM Life Cycle Cost Model
- B.3 Detailed Cost Model

#### C. DAHP & TRIBAL CORRESPONDENCE

- C.1 Status of Tribal Liaison
- C.2 DAHP Correspondence
- C.3 Tribal Correspondence

### D. PROJECT DETAIL

- D.1 Detailed Space Program
- D.2 Architectural Basis of Design Narrative
- D.3 Civil Basis of Design Narrative
- D.4 Landscape Basis of Design Narrative
- D.5 Structural Basis of Design Narrative
- D.6 Mechanical and Plumbing Basis of Design Narrative
- D.7 Electrical, Telecom & Security Basis of Design Narrative

## SECTION 06

## APPENDIX A: PREDESIGN CHECKLIST

## EXECUTIVE SUMMARY

## PROBLEM STATEMENT, OPPORTUNITY, OR PROGRAM REQUIREMENT

- Identify the problem, opportunity or program requirement that the project addresses and how it will be accomplished.
- Identify and explain the statutory or other requirements that drive the project's operational programs and how these affect the need for space, location or physical accommodations. Include anticipated caseload projections (growth or decline) and assumptions, if applicable.
- Explain the connection between the agency's mission, goals and objectives; statutory requirements; and the problem, opportunity or program requirements.
- Describe in general terms what is needed to solve the problem.
- Include any relevant history of the project, including previous predesigns or budget funding requests that did not go forward to design or construction.

## ANALYSIS OF ALTERNATIVES (INCLUDING THE PREFERRED ALTERNATIVE)

- Describe all alternatives that were considered, including the preferred alternative. Include:
  - A no action alternative.
  - Advantages and disadvantages of each alternative. Please include a high-level summary table with your analysis that compares the alternatives, including the anticipated cost for each alternative.
  - Cost estimates for each alternative:
    - Provide enough information so decision makers have a general understanding of the costs.
    - Complete OFM's Life Cycle Cost Model (RCW 39.35B.050).
  - Schedule estimates for each alternative. Estimate the start, midpoint and completion dates.

## DETAILED ANALYSIS OF PREFERRED ALTERNATIVE

- Nature Of Space
  - Community Gathering Areas
  - American Indian Student Center
- Occupancy
- Basic configuration of the building, including square footage and the number of floors.
- Space needs assessment. Identify the guidelines used.
- Site Analysis
  - Identify site studies that are completed or under way and summarize their results.
  - Location.
  - Building footprint and its relationship to adjacent facilities and site features. Provide aerial view, sketches of the building site and basic floor plans.
  - Water rights and water availability.
  - Stormwater requirements.
  - Ownership of the site, easements, and any acquisition issues.
  - Property setback requirements.
  - Potential issues with the surrounding neighborhood, during construction and ongoing.
  - Utility extension or relocation issues.
  - Potential environmental impacts.
  - Parking and access issues, including improvements required by local ordinances, local road impacts and parking demand.
  - Impact on surroundings and existing development with construction lay-down areas and construction phasing.
- Consistency With Applicable Long-Term Plans
- Consistency with other laws and regulations:
  - High-performance public buildings (Chapter 39.35D RCW).

- State efficiency and environmental performance, if applicable (Executive Order 20-01).
- State energy standards for clean buildings (RCW 19.27A.210).
- Compliance with required vehicle charging capability for new buildings that provide on-site parking (RCW 19.27.540).
- Greenhouse gas emissions reduction policy (RCW 70.235.070).
- Archaeological and cultural resources (Executive Order 05-05 and Section 106 of the National Historic Preservation Act of 1966).
- Americans with Disabilities Act (ADA) implementation (Executive Order 96-04).
- Compliance with planning under Chapter 36.70A RCW, as required by RCW 43.88.0301.
- Information required by RCW 43.88.0301(1).
- Other codes or regulations.
- Identify problems that require further study. Evaluate identified problems to establish probable costs and risk.
- Identify significant or distinguishable components, including major equipment and ADA requirements in excess of existing code.
- Identify planned technology infrastructure and other related IT investments that affect the building plans.
- Identify any site-related and/or physical security measures for the project.
- Describe planned commissioning to ensure systems function as designed.
- Describe any future phases or other facilities that will affect this project.
- Provide a comparative discussion of the pros and cons of the project delivery methods considered for this project and offer a recommendation of proposed procurement method for the preferred alternative.
- Describe how the project will be managed within the agency.
- Schedule.
  - Provide a high-level milestone schedule for the project, including key dates for budget approval, design, bid, acquisition, construction, equipment installation, testing, occupancy and full operation.
  - Incorporate value-engineering analysis and constructability review into the project schedule, as required by RCW 43.88.110(5)(c).
  - Describe factors that may delay the project schedule.
  - Describe the permitting or local government ordinances or neighborhood issues (such as location or parking compatibility) that could affect the schedule.
  - Identify when the local jurisdiction will be contacted and whether community stakeholder meetings are a part of the process.

#### **PROJECT BUDGET ANALYSIS FOR THE PREFERRED ALTERNATIVE**

- Cost estimate.
  - Major assumptions used in preparing the cost estimate.
  - Summary table of Uniformat Level II cost estimates.
  - The C-100.
- Proposed funding.
  - Identify the fund sources and expected receipt of the funds.
- N/A If alternatively financed, such as through a COP, provide the projected debt service and fund source. Include the assumptions used for calculating finance terms and interest rates.
- Facility operations and maintenance requirements.
  - Define the anticipated impact of the proposed project on the operating budget for the agency or institution. Include maintenance and operating assumptions (including FTEs) and moving costs.
  - Show five biennia of capital and operating costs from the time of occupancy, including an estimate of building repair, replacement and maintenance.
  - Identify the agency responsible for ongoing maintenance and operations, if not maintained by the owner.
- Clarify whether furniture, fixtures and equipment are included in the project budget. If not included, explain why.

#### **PREDESIGN APPENDICES**

- A. Predesign Checklist.
- B. Completed Life Cycle Cost Model.
- C. DAHP Letter.
- N/A Title report for projects including proposed acquisition.

SECTION 06

# APPENDIX C: DAHP & TRIBAL CORRESPONDENCE

## C.1 STATUS OF TRIBAL LIAISON

Eastern Washington coordinated with the Department of Archaeology and Historic Preservation (DAHP) to verify and confirm tribes to contact regarding the Lucy Covington Leadership House.

The tribes that EWU was required to contact fall within the Federally Recognized Tribes of Washington State and the Washington State Tribal Reservations and Draft Treaty Ceded Areas.

The following tribes were contacted:

- > Confederated Tribes of the Colville Reservation
- > Coeur d'Alene Tribe
- > Spokane Tribe of Indians

## C.2 DAHP CORRESPONDENCE

Correspondence from DAHP regarding the Lucy Covington Leadership House Predesign is included on the following page.

## C.3 TRIBAL CORRESPONDENCE

Correspondence regarding the Lucy Covington Leadership House Predesign was sent to the tribal representatives listed below. Letters to each tribe are included on the following pages.

### > **Confederated Tribes of the Colville Reservation**

Guy Moura,  
Tribal Historic Preservation Officer

### > **Coeur d'Alene Tribe**

Jill Maria Wagner, PHD,  
Tribal Historic Preservation Officer

### > **Spokane Tribe of Indians**

Randy Abrahamson,  
Tribal Historic Preservation Officer

Allyson Brooks Ph.D., Director  
State Historic Preservation Officer

June 13, 2024

Troy Bester  
Senior Project Manager  
Construction and Planning Services, EWU

In future correspondence please refer to:  
Project Tracking Code: 2024-06-04182  
Property: Lucy Covington Leadership House - EWU Cheney Campus  
Re: No Historic Resources Impacted

Dear Troy:

Thank you for contacting the Washington State Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. This action has been reviewed on behalf of the State Historic Preservation Officer (SHPO) under provisions of Governor's Executive Order 21-02. Our review is based upon documentation provided in your submittal. Please note this review is for the predesign phase of the project only.

It is our opinion that no historic resources will be impacted by the current project as proposed.

As a result of our opinion, further contact with DAHP on this proposal is not necessary. However, if new information about affected resources becomes available and/or the project scope of work changes significantly, please resume consultation as our assessment may be revised. Also, if any archaeological resources are uncovered during construction, please halt work immediately in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Maddie Levesque, M.A  
Architectural Historian

RE: Propose Project at Eastern Washington University  
Lucy Covington Leadership House  
EWU Project No. CP1112

Mr. Moura,

This letter is to notify you of a proposed project, Lucy Covington Leadership Center, on the Eastern Washington University campus. In alignment with the requirements of the Office of Financial Management, the university will be submitting a predesign report for state review/approval of the project on June 30, 2024.

The building is proposed as a single-story structure totaling approximately 15,000 gross square feet. The Lucy Covington Leadership House will be a center to support the success of Native American students at the university and beyond. It will provide a location focused on creating a sense of community for these students allowing for an easier transition from their home to the university setting. The facility brings together cultural/community gathering & event spaces, student collaboration & support spaces, and exhibit gallery & performance spaces.

The initial site proposed for construction will be located entirely on the previously disturbed ground of the demolished Reid Laboratory School. Reid School was demolished in 2016. Sitework on the project will be minimal and focused on provision of utilities from a proposed geothermal plant nearby, paving parking and landscaping. A site diagram illustrating this area of work is attached.

Project specifications will include requirements for an Inadvertent Discover Plan (IDP) should any artifacts or remains be discovered during excavation.

We look forward to any comments or information you may have about any archaeological, historic, or cultural resources that may affect this project.

Sincerely,

Troy Bester  
Senior Project Manager

**TABLE:**  
Minimum R-Values & U-Values for Exterior Component Type

## D.2 ARCHITECTURAL BASIS OF DESIGN NARRATIVE

### PROJECT DESCRIPTION

Construction of a new 1 story community gathering, student center and exhibit hall building at Eastern Washington University. The selected site for the Predesign analysis was the Reid Hall site immediately south of Martin Williamson Hall.

### JURISDICTION

Anticipated Applicable Codes:

- > Building: 2021 International Building Code, with Washington State Amendments, Chapter 51-50 WAC.
- > Mechanical: 2021 International Mechanical Code, Chapter 51-52 WAC.
- > Plumbing: 2018 Uniform Plumbing Code, Chapter 51-56 and 51-57 WAC.
- > Electrical: 2020 National Electric Code (NFPA 70), Chapter 296-46B WAC.
- > Fire: 2018 Washington State Fire Code, with Washington State Amendments
- > Energy Code: 2021 International Energy Conservation Code (IECC) and Amendments, Chapters 51-11C and 51-11R WAC.
- > Accessibility: ICC A117.1-2017 Standard for Accessible and Usable Buildings and Facilities.
- > Building height and other planning regulations are governed by City of Cheney Municipal Code and Title 21 Zoning.

The project is required to submit for the State Environmental Policy Act (SEPA).

The roughly 15,000 sf building will be mixed occupancy of Assembly Group A3 as defined by the International Building Code (IBC). The building will be fully NFPA 13 sprinklered.

**Construction Type:** V-B

**Allowable Building Height based on Construction Type:** 60'

| Component        | 2021 WSEC       |
|------------------|-----------------|
| Foundation       | R-10 for 2 ft   |
| Basement Wall    | R-13 batt + R10 |
| Exterior Walls   | R-13 batt + R10 |
| Exterior Soffits | R-38 batt + R10 |
| Roof             | R-38 ci         |
| Glazing          | U-0.34          |
| Glazing %        | 30% max         |
| Doors            | U-0.34 (glazed) |
| HVAC             | Calculated      |

**Allowable number of Stories above Grade:** 2

**Allowable area per floor (A-3 occupancy):** 24,000 (S1-single story), 18,000 (multi-story) 38,000 (S1-single story)

Fire-resistance rated construction is largely not anticipated. The exception will be shafts and egress stairs.

### GREEN BUILDING STANDARD

**LEEDv4 Certified Silver BD+C minimum, Certified Gold BD+C preferred:**

- > Website: <https://www.usgbc.org/resources/leed-v4-building-design-and-construction-current-version>

**Washington State Clean Buildings Act alignment:**

- > Website: <https://www.commerce.wa.gov/growing-the-economy/energy/buildings>

### BUILDING SYSTEMS AND COMPONENTS

#### BUILDING ENVELOPE

A continuous self-adhered air and weather resistive barrier will cover the entire exterior sheathing. Thermal bridges are to be minimized and all penetrations of the exterior air barrier will be fully sealed. The exterior enclosure will be constructed to achieve a maximum air-leakage rating of 0.17 cfm/ft at 0.3 inches water gauge. The building will be blower door tested to demonstrate conformance.

#### Exterior Walls:

Exterior walls will be of non-bearing light gauge steel stud or may be wood studs for Type V-B. have R-24 fiberglass batt insulation filling the cavities between studs. In addition, there will be a minimum of 2 inches of continuous exterior mineral board insulation.

- > Clear Cedar

At select locations, the use of wood siding and particularly cedar will be used. This is recommended to be under covered areas or protected from exposure. Where exposed, it shall have a durable exterior clear or semi transparent sealer with wood products dipped and coated on all sides with the sealer.

- > Metal Panels

At select locations, Composite wall panels with concealed clips and/or fasteners over a thermally broken fiberglass clip or rail system to attach the building cladding back to the exterior wall structure

#### Exterior Windows:

Aluminum Storefront System

- > Basis of Design: Aluminum framed, Kawneer Trifab 451UT thermally broken.
- > Glazing: 1-inch double-pane Solarban 70 glazing with low-e coating on 2 surfaces, argon filled, or similar; code compliant.
- > Finish: High-performance Kynar coating, Dark Bronze.
- > Flashing: Prefinished aluminum to match.

**TABLE:**  
**Proposed Interior Finishes for Basis of Design**

| Program Area Types   | Floors                        | Walls                                       | Ceilings   |
|--|-------------------------------|---|--|
| Speaking Hall  | Wood Gymnasium grade flooring | Level 4 GWB<br>50% Acoustical Treatment     | Open to structure (CLT).<br>50% Acoustical treatment |
| Learning Commons   | Carpet                        | Level 4 GWB<br>30% Acoustical Treatment     | Open to structure (CLT).<br>50% Acoustical treatment |
| Dining Area  | Polished Concrete             | Level 4 GWB<br>50% Acoustical Treatment     | Open to structure (CLT).<br>50% Acoustical treatment |
| Exhibit Areas  | Wood Gymnasium grade flooring | Level 4 GWB<br>30% Acoustical Treatment     | Open to structure (CLT).<br>50% Acoustical treatment |
| Building Support incl:<br>Storage, Receiving ,<br>Custodial, MEP | Sealed Concrete               | Level 3 GWB                                 | Open to structure.                                   |
| Circulation - Hallways   | Polished Concrete             | Level 4 GWB                                 | Open to structure (CLT).                             |
| Restrooms  | Floor Tile                    | Wall Tile up to 7' on all wall<br>surfaces. | GWB  |

**Exterior Openings:**

Exterior doors will be thermally broken, aluminum framed. Exterior doors at main entries will be fully accessible and have bollard mounted ADA push button paddles to operate motorized door openers.

Exterior louvers will be located as high off the ground as possible for security purposes. Their construction should be fully tamper-resistant and capable of preventing ingress. Louvers will be prefinished, or field painted to match adjacent finishes, factory fabricated and complete with frame, mullions and insect screens.

**Roofing:**

Low sloped roofs will be insulated to an average value of R-49 with continuous exterior board insulation located above the roof deck. Insulation will be mechanically fastened over a self-adhered vapor barrier over protection board and roof sheathing. Fleece-backed TPO (thermoplastic polyolefin) will be used as the roof membrane and be a minimum 80-mil thickness. Water will be directed to a series of roof scuppers, conductor heads and downspouts for drainage and potential on-site water storage facility.

- > Sloped roof will be at a 3:12 slope and clad with Metal Roof Panels:
- > Profile: 24 Gauge Standing Seam with minimum 1" seam height and concealed fastener system.
- > Texture & Finish: Smooth, Fluoropolymer Coil Coating System.
- > Snowguard: Continuous Fence type snow guard attached to standing seams with aluminum clamps.

Fall protection system will be a roof tie down system with Roof Anchors.

**INTERIORS**

**Casework:**

Casework throughout the project will conform to the North American Architectural Woodwork Standards (NAAWS), custom grade. Medium Density Fiberboard (MDF) with no added formaldehyde (NAF) will be used as the primary substrate for HPDL finished elements or solid wood. In wet areas, such as countertops, moisture resistant MDF is to be used. Casework is to be constructed using a frameless, flush overlay style with concealed European-style hinges. Forest Stewardship Council (FSC) Certified wood and composite wood for casework shall be required.

**Wall Finishes:**

Speaking Hall areas and Exhibit Areas will have a higher level of finish, furniture, display, and technology components. Assume use of wood veneer paneling, acoustic wall paneling and a more aesthetic acoustic ceiling system at these areas as identified in the table above.

**Restrooms:**

All shared restroom facilities will have full height partitions with locking doors and exhaust air ducting for each space. Toilet compartments and handwashing areas to have ceramic floor tile and ceramic wall tile up to an 7-foot height. There will be one accessible drinking fountain with a bottle filler.

## D.3 CIVIL BASIS OF DESIGN NARRATIVE

### SITE ANALYSIS

The proposed building will be in the northeast portion of the site with a paved access way that connects 7th Street to the building and will serve as a loading area and as a location for required ADA stalls. The access roadway will have enough space for loading and for a garbage truck to drive, turn around, and leave the facility. Concrete sidewalks will connect the main entrance of the building to the existing campus walkway system, as well as walkways to the south. Since this building serves as a building for Eastern Washington University students, most students will walk to this facility and not drive. There is an existing 60-stall parking lot at the south corner of the site that will remain.

The site is generally flat and based on NRCS Web Soil Survey the soils do not appear to present any challenges for foundation design and stormwater management. Stormwater runoff from the building and pavement will be routed to swales with drywells. The stormwater drainage will be treated for water quality and infiltrated in bio-infiltration swales. The approximate size for these swales is 4,400 square feet. The roof drains will connect to the drywells or incorporate into landscape design features. Typical sizes for storm drain piping are 6" to 8" diameter PVC pipes.

During the construction activities for this project there should be minimal impact to surrounding neighborhoods and their daily uses. Most construction activities and equipment/material storage should remain on the site. There may be minimal traffic control when connecting the access road to 7th Street and if large equipment is mobilized. All existing trees and vegetation will be protected during construction. The site will be seeded and irrigated after construction is completed. All necessary erosion control methods will be utilized during construction.

### STORMWATER REQUIREMENTS

The proposed facility will follow the Stormwater Management Manual for Eastern Washington to meet the requirements for conveyance, flow control, and water quality treatment. It is anticipated that all stormwater will infiltrate on site but rainwater harvesting may be used to gain some LEED points. There will be a small amount of pollution generating impervious area, a small parking lot with an access road, that will be conveyed to a bio infiltration swale for water quality treatment. The bio infiltration swale will also be used for collecting the roof runoff from the building. Catch basins and piping will collect the runoff from the building and hard surface and be routed to the bio infiltration swales.

### UTILITY EXTENSION / RELOCATION ISSUES

The existing site currently has water and sewer stubbed to the site as there was an existing building in the northeast corner of the lot that has been removed. The old water and sewer lines that went to an existing building will need to be removed / abandoned. There are existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building. It is assumed the building will have fire sprinklers and will need a fire service line as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design. There also is an existing utility tunnel under the existing concrete sidewalk as well as abandoned cable lines near the site.

### EASEMENTS

There are no known easements located on the site.

## D.4 LANDSCAPE BASIS OF DESIGN NARRATIVE

### EXISTING SITE LANDSCAPE

The existing site is generally flat and has some minimal landscaping. There are irrigated turf and trees around the edges near pedestrian walkways and buildings. There is a large portion of the site covered in sparse turf areas with no irrigation.

### LANDSCAPE DESIGN GUIDANCE

The exterior landscape design will be guided by several resources. It will be guided by the principles outlined EWU Climate Resiliency Landscape Masterplan, the Climate Action Plan, and the Prairie Restoration Project. It will also include input from project stakeholders and any other applicable requirements.

### LEED CREDIT

The Lucy Covington Leadership Center Project is projected to receive a LEED Silver rating. Within LEED there are several areas where there is potential to gain points as they relate to the landscape design of this project.

- > Protect and Restore credits can be gained with 25 percent of the site being planted with native and adapted plant materials.
- > Open Space credit can be obtained by providing 30 percent or more of open space for the total site.
- > Rainwater Management credit can be gained by providing rain gardens with native and adapted plants, use of permeable paving, and providing permanent stormwater infiltration systems that collect 100 percent using features vegetated swales, rain gardens, or water cistern.
- > Heat Island Reduction credit can be gained by providing plant materials to shade paved areas and by providing paving materials that have an initial solar reflectance of at least 0.33.

- > Outdoor Water Reduction credit can also be gained by use of no irrigation or reduced irrigation by reducing outdoor water consumption by 50 percent from the calculated from the sites peak watering month as calculated by the Environmental Protection Agency (EPA) Water Sense Budgeting tool.

### OTHER RESOURCES

Other resources that will be utilized in the project will include the Washington Native Plant Society, native plant nurseries, and other resources with knowledge of native plants historically used by American Indians in the Eastern Washington areas. Information from local extension offices may also be utilized as a resource.

### LUCY COVINGTON LEADERSHIP CENTER LANDSCAPE DESIGN

With the existing site being flat with little landscaping, landscape design features will be added to define spaces, provide interest, and provide educational opportunities. Predominately native and adapted plants will be used.

Foundation plantings will be provided around the building, along with a location for a medicinal plant garden incorporating plants that have historically been used by American Indians.

Shade trees will be provided throughout the site. Berms and rock features will also be used to define spaces and provide interest to the project.

A water conserving irrigation system will be designed to irrigate plants and reduce exterior water usage. Landscape plantings and features will be integrated into the site's stormwater system to reduce stormwater runoff and piping.

Other features incorporated into the exterior landscape will include pedestrian walkways, benches for seating, a cook shed, sweat lodge location, outdoor gathering space, outdoor classroom/event space, and an outdoor seating/dining area. In addition, there is potential to restore small areas to their original historical prairie condition, as is being planned in EWU Prairie Restoration Project.

**TABLE:**  
**Concrete Requirements**

## D.5 STRUCTURAL BASIS OF DESIGN NARRATIVE

The following design narrative provides a general overview of the structural design including design loads, performance criteria, framing and lateral system descriptions, and material specifications.

### DESIGN CRITERIA

#### 2021 International Building Code

**Roof Dead Load** (includes solar panel load): 25 PSF

**Snow Load:** 32 PSF

- > Ground Snow: 40 PSF
- > Drifting and unbalanced snow loading in accordance with ASCE 7.
- > Importance Factor = 1.10 (based on Occupancy Category III rating)

**Roof Total Load Deflection Limit:** L/240

**Roof Live Load Deflection Limit:** L/360

#### Wind Design

- > Basic Wind Speed (3-second gust): 109 MPH
- > Exposure C
- > Risk Category III

#### Seismic Design

- > Site Class(Per code minimum) D
- > Spectral Response Coefficient (Short Period) SDS: 32.7%g
- > Spectral Response Coefficient (1-Second Period) SD1: 18.0%g
- > Seismic Design Category C
- > Importance Factor 1.25

### BUILDING FRAMING RECOMMENDATIONS

Preliminary plans are for a single story structure with a space for assembly with a high ceiling. Framing options for gravity loads include:

- > Conventional framing of wood studs with plywood sheathing for lateral design with press plate wood trusses for roof framing.

|                             | Minimum 28 Day Compressive Strength | Air Entrainment (+/- 1.5%) | Maximum Size Aggregate | Maximum Water/cement Ratio |
|-----------------------------|-------------------------------------|----------------------------|------------------------|----------------------------|
| All Structural Conc, U.N.O. | 3000 PSI                            | None                       | 3/4"                   | 0.50                       |
| Interior Slabs on Grade     | 3000 PSI                            | None                       | 3/4"                   | 0.42*                      |
| Exterior Slabs on Grade     | 4000 PSI                            | 6%                         | 3/4"                   | 0.45                       |
| Topping Slabs               | 3000 PSI                            | None                       | 3/8"                   | 0.42*                      |
| Footings                    | 3000 PSI                            | None                       | 1"                     | 0.50                       |
| Foundation Stem Walls       | 3000 PSI                            | 5%                         | 3/4"                   | 0.45                       |
| Exterior C.I.P. Walls       | 3000 PSI                            | 5%                         | 3/4"                   | 0.45                       |
| Structural Slabs & Columns  | 4000 PSI                            | None                       | 3/4"                   | 0.50                       |

\* Water/Cement ratio variance not allowed.

All reinforcing bars to be Grade 60 (Fy = 60,000 psi)

- > Mass-Timber framing with Cross-Laminated Timber members and glu-laminated beams.
- > The tall assembly space may require structural steel braced frames or moment frames depending on the openness of the space of the final design.

Foundations will consist of conventional, reinforced, continuous spread footings. Columns will be supported on reinforced, isolated concrete footings. Footing sizes will be designed to meet the allowable soil bearing pressure. The floor will be a 4 inch thick slab on grade, reinforced with #4 rebar at 24" on center, each way. Slab joint spacing will be approximately 12'-0" on center in each direction. Sub-grade preparation for the slab on grade will be completed per the geotechnical report.

The roof framing over the two wings of the structure and the assembly space will be proprietary wood members such as RedBuilt Joists or Glu-Lam beams with SIPS panels for the decking.

Wind and earthquake forces will be resisted by a likely combination of the following options:

- > Plywood-sheathed shear walls
- > Steel-braced frames/moment frames
- > CLT wall panels

### MATERIAL SPECIFICATIONS

**Concrete Requirements:** As shown in Table above.

#### Steel Framing Requirements

- > Connection material, embedded items: ASTM A36
- > Structural Tubes: ASTM A500, Grade B
- > Structural framing bolts (steel connections): ASTM A325N
- > Anchor Rods: ASTM A36
- > Threaded Rods: ASTM A36
- > Welding Electrodes: E70XX

#### Glu-Laminated Timber Beams

Per AITC 117 "Design Standard Specifications for Structural Glued Laminated Timber of Softwood Species"

Simple span beams: 24F-V4

Continuous or cantilever beams: 24F-V8

#### Cross-Laminated Timber Panels

CLT members to comply with ANSI/APA PRG 320 "Standard for Performance-Rated Cross-Laminated Timber"

#### Proprietary Wood Products

Premanufactured wood I-joists, open-web joists, beams, and trusses to have ICC acceptance. Possible manufacturers include but are not limited to:

- > RedBuilt
- > Trus Joist by Weyerhaeuser

## D.6 MECHANICAL BASIS OF DESIGN NARRATIVE

### GENERAL MECHANICAL REQUIREMENTS

All mechanical systems, equipment and components will be designed, selected and installed in accordance with all applicable codes and standards including:

- > International Building Code (IBC), Standards and Amendments.
- > International Mechanical Code (IMC), Standards and Amendments.
- > International Fire Code (IFC), Standards and Amendments.
- > Uniform Plumbing Code (UPC) Standards and Amendments.
- > International Fuel Gas Code (IFGC).
- > National Fire Protection Association (NFPA).
- > National Electrical Code, (NEC); NFPA 70.
- > 2021 Washington State Energy Code and all applicable State and local codes, laws and ordinances.
- > LEED Silver Criteria
- > Eastern Washington University Climate Action Plan 2022-2025
- > 2021-23Pre-design Manual for Capital Projects
- > Industry Standards
  - American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)
  - Air Conditioning and Refrigeration Institute (ARI) Standards
  - NFPA 90A - Installation of Air Conditioning and Ventilating Systems

### ENERGY

#### Project Sustainability Goals

##### Electrification

- > As the electrical grid adopts greater percentages of renewable energy sources (wind, solar, hydro, etc.), a path to decarbonize the built environment is electrification. The 2021 Washington Energy Code will require electrification for buildings of this size & occupancy for HVAC systems and partial electrification of building domestic hot water. This will be accomplished for this project through heat pump technology via a centrally located ground source.

##### LEED Certification

- > Project is targeting LEED Silver certification minimum under the v4.1 New Construction pathway.

##### Resiliency

- > Project should consider the effects of climate change on projected weather patterns when sizing and planning for operation of HVAC systems.

##### High Performance Public Buildings per 39.35D RCW

- > Project to achieve LEED Silver minimum

##### Net Zero Energy per Executive Order 20-01

- > Building to be designed to zero energy or zero energy-capable
- > Team to evaluate building expected EUI and required PV array size along with for net zero ready, to be located on or off site as allowed by AHJ

##### Clean Buildings Act per RCW 19.27A.210

- > Compliance with operating EUI targets beginning in 2028

##### GHG Emissions Reduction Policy

- > Building to comply with statewide GHG emissions reporting requirements.
- > Follow EWU Climate Action Plan objectives.

#### 2021 WSEC Compliance

Project will be subject to the 2021 Washington building codes, including the 2021 Washington State Energy Code.

#### Envelope

- > Project is anticipated to comply prescriptively with envelope provisions via the R-value, U-value, or Component Performance alternative approach.

#### C406 Additional Energy Efficiency Credit Measures

- > Project shall comply with the minimum number of new building energy efficiency credits and new building load management credits per Table C406.1 and Table C406.2.
- > Suggested efficiency credit strategies to explore include but are not limited to:

Improved heating efficiency

High-performance DOAS

Reduced lighting power

Renewable energy

Heat pump domestic hot water heating

Reduced air infiltration

- > Suggested load management credit strategies to explore include but are not limited to:

Lighting load management

HVAC load management

Building thermal mass

Renewable Energy

- > Project shall either provide an on-site solar PV array sized per section C411 or shall comply with one of the available exceptions. Preliminary size calculated at approximately 15 kW installed capacity.

- > Project shall comply with solar readiness requirements to provide a solar zone for future PV and per section C411.

## MECHANICAL SYSTEMS

The following narrative describes the mechanical systems intended for the new Lucy Covington Building which is to be constructed in a two phase approach.

### Project Mechanical Goals

Utilize the EWU Physical Chilled Water Plant & New Geothermal Heating Plant proposed.

- > EWU has invested heavily in this chilled water plant over the years, and it has the available capacity to serve this new Lucy Covington building. In addition, there are pipe mains extremely close to the proposed building footprint. The project team will make use of this available source.
- > Utilize approximate 120 degree heating water for the new geothermal heating plant to reduce carbon footprint and reduce fossil fuel load of current campus steam system. New direct bury piping or tunnel construction will be required from central geothermal plant to proposed mechanical room location in phase 1.

### Healthy Buildings

- > Utilize decoupled ventilation & conditioning strategies using dedicated outside air systems (DOAS) or also known as energy recovery ventilators (ERV). These systems operate with the core intent to ensure buildings are well ventilated for students to learn success and improve energy efficiency. Provide both MERV 15 & carbon filtration to ensure high indoor air quality, even during forest fire seasons. Consider design impacts of future pandemic resiliency direction.

### Building Load Estimates

Cooling: ~70 tons (120 gpm) Total

~46.6 tons (80 gpm) for phase 1

~23.4 tons (40 gpm) for phase 2

Heating: ~975 MBH Total

~640 MBH (60 gpm) for phase 1

~335 MBH (30 gpm) for phase 2

Ventilation: ~9,600cfm

### Design Temperatures

- > Cooling air supply temperature: 55°F-60°F
- > Heating air supply temperature: 85°F-90°F
- > Chilled water supply/return: 44°F/56°F (from campus central chiller plant)
- > Heating water supply/return: 115-120°F/95-100°F (from new geothermal plant)

### Electrified Source Energy System Concept

#### Heating System

- > Hot water provided by the new campus low temperature heating water system that can supply 115-120°F water for heating use in building hot water coils.

#### Pumping configuration – primary/secondary

- > (2) primary inline pumps operating constant volume integral to equipment.
- > (2) secondary vertical inline pumps operating variable volume will serve building coils as required.
  - Pressure independent control valves to be used at all coils.
  - Control per local and remote DP sensors.
- > Located in the main mechanical room of phase 1.
- > Piping to be sized to accommodate phase 2 of project but capped at phase 1 for continuation.

#### Backup boiler plant hot water connection.

- > Sized to support the hot water supply via steam to hot water heat exchanger from EWU steam plant on campus via utility tunnels close to the Lucy Covington site & also build in system resiliency.

Other hydronic components include but are not limited to:

- > Coalescing air separator sized for nominal main pipe size.
- > Expansion tank.
- > Makeup water assembly.
- > Locate all hydronic equipment in the main mechanical room of phase 1.

### Cooling System

- > Pumping configuration – Primary, Secondary, Tertiary
- > The primary and secondary pumps exist and are located at EWU's physical plant. Provide (2) tertiary vertical inline pumps operating variable volume to serve building coils. Tap off campus chilled water distribution utility tunnel northwest of building footprint and provide isolation valves exterior to the building in a small vault and immediately inside building.
- > Pressure independent control valves to be used at all coils
- > Control per local and remote DP sensors
- > For system options I, provide (2) dedicated inline pumps to serve the terminal coil with lower temperature water (dehumidification ability). The tertiary pumping assembly described above will tap off the return line to the building, mix to 55-57°F and serve all building sensible only coils in the chilled beam system.
- > Locate in main mechanical room in phase 1

### Vibration & Sound Isolation

Mechanical equipment will be provided with vibration isolation mounts and hangers to meet criteria for maximum vibration levels.

HVAC systems will be designed to a maximum sound level of 45 dBA on the "A" weighted scale. More sensitive areas will be dealt with on a case-by-case basis depending on the space's specific requirements.

**IMAGE:**  
Dedicated Outside Air System (DOAS)

### Mechanical Insulation

Refrigerant piping will be insulated per manufacturers recommendations and IMC requirements.

Ductwork will be insulated with either external, flexible glass fiber blankets or internal, acoustical glass fiber duct liner.

### Exhaust Systems

Toilet rooms, and general room exhaust will be provided with either individual exhaust fans or can be integrated to the DOAS system exhaust so the energy can be recovered from the conditioned air that would otherwise be wasted.

### Air Distribution

Supply and return air will be distributed to each zone from the chilled beams(s) and fan coil(s) to the associated zone(s). Duct will be constructed per SMACNA standards and lining will be used to attenuate sound as needed to maintain acceptable sound levels for spaces served.

### Ductless Split System

A ductless mini split system, in its most basic form, includes one outdoor unit and one indoor unit, connected by refrigerant tubing and electrical wiring. The indoor unit is often wall-mounted and delivers heated or cooled air directly into the space – no ductwork needed. Ductless split systems will be utilized for rooms such as IT and electrical which require year-round dedicated cooling.

### Kitchen Exhaust and Make-up Air System

A type I hood system will be required for the commercial kitchen space. The indoor hood will be selected to meet the needs and equipment of the cooking space. A dedicated makeup air unit with evaporative cooling and natural gas heat will be located near the kitchen and ducted to the hood plenum. Demand controlled ventilation will be used to limit the amount of outside air needed from the makeup air unit and exhaust fan when systems under the hood are only in partial use.

### Dedicated Outside Air System (DOAS)

All systems mentioned in HVAC system options will be coupled with an energy recovery DOAS system to provide ventilation to each space throughout the facility. This system uses a centralized dedicated outside air fan system to filter and temper the outside air that is required to maintain an acceptable level of indoor air quality with a modern office building. The tempered air (55 F to 65 F) is distributed to multiple fan coil units that provide individual zone control to different parts of the building.

The DOAS draws air into the building through a set of MERV 13 minimum filters to remove the majority of particulate matter from the air. After the filters, the air is passed through an energy recovery heat reclaim coil that preheats the air with waste heat from the building exhaust system. Next the air is passed through heating and cooling coils which operate depending upon the ambient conditions. A supply fan is then used to distribute the tempered outside air through the building to the system chosen for building conditioning.

### Control Systems

This facility will utilize a Direct Digital Control system (DDC) for the control of the HVAC systems.

System features will include but not the following:

- > Optimum start/stop
- > Demand limiting
- > Monitoring of supply air, outside air and mixed air temperatures
- > Alarms
- > Trend logging

The control system will have a direct interface with the electric utility meter for energy monitoring purposes. All air handling units will be equipped with airflow measuring stations in the outside air ductwork to ensure adequate and efficient ventilation. All air handling units and fan coil units will be equipped with economizer capability.

### HVAC OPERATING STRATEGIES TO MAXIMIZE ENERGY SAVINGS

Varying air handler fan speeds:

- > Fan speeds may be adjusted not only in response to heating or cooling needs, but also to limit peak electrical demand. Most buildings exhibit thermal inertia, meaning that the mass of the structure and its contents tend to stabilize temperature changes even when heating and cooling systems work to alter them.

**IMAGE:**  
Chilled Beam System with DOAS

- > Some facility maintenance engineers have taken advantage of this stabilizing effect by reducing air handler fan speeds and the cooling or heating inherent in circulating air for brief periods (for example, 10 minutes out of an hour) when power cost is most costly. By sequentially shifting this reduction among all air handlers, no one space feels the reduction long enough to result in a significant change to occupant comfort.

Cooling and heating coil water supply temperatures:

- > An outdoor air sensor may be used with appropriate programming to raise heating water temperature as outdoor temperatures drop and lower it on moderate days.

Supply water temperatures also may be reset based on return water or return air temperature where they reflect the need for conditioning specific zones or on a time schedule to reflect occupancy. When no one is in space, its temperature may be allowed to vary widely.

Carbon dioxide sensors:

- > Carbon dioxide sensors can be used to control outside air intake. As with temperature control, sound HVAC design provides sufficient fresh air to deal with the worst-case scenario, including full occupancy in a zone such as meeting rooms or cafeterias. Most of the time, however, these spaces are only partially filled, so that far more outside air is brought in than required by code or comfort under this condition. Conditioning of outside air, at times, can account for nearly half the load on an HVAC system.
- > By measuring carbon dioxide in return air, a reasonable estimate of the number of occupants may be made, allowing for a reduction in outside air.

Chilled and heating water pump speed:

- > Pump speed can be reduced through the use of variable speed drives. When zone coil water control valves throttle back in response to a reduced load in the space, a pressure sensor located within the piping system can sense the change in pressure and reduce the flow through the system accordingly.

### HVAC SYSTEM OPTIONS

#### Chilled Beam System with DOAS (Preferred Alternative)

Active chilled beams use a circulating hot and chilled water loop that is routed to each heat pump unit. The heating and cooling source of this loop will come from either new the central geothermal campus plant and can be backed up via current campus central plant steam system.

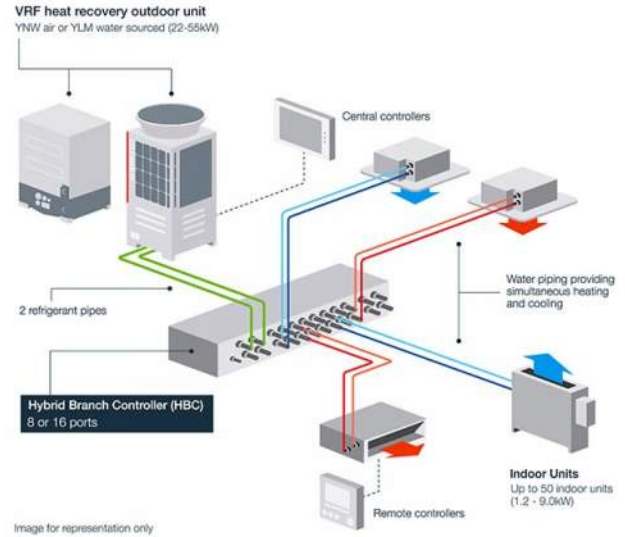

Each chilled beam unit has a chilled and heated water connection to provide heating and cooling with the use of ventilation air from an energy recovery ventilator (DOAS). The temperature differential between the supplied and room air provides 3-4 times the amount of airflow increase through induction from what is provided to each chilled beam unit which greatly reduces overall system fan energy.

This mechanical system can vary widely in cost depending on geothermal plant capability. For pricing of this system, it is assumed to be heated water from the new geothermal heating plant with backup heat from campus steam system along with chilled water from the current chilled water plant and is estimated at approximately \$50/SF.

Advantages:

- > It's very flexible. The system can be subdivided or expanded into new zones to fit building remodeling or additions easily and inexpensively.
- > If a unit fails, the entire system doesn't shut down.
- > This type of system can easily be designed to facilitate partial occupancy of the building while the remaining portions are unoccupied.
- > No moving parts or filters on terminal units so maintenance is extremely low.
- > Its high efficiency reduces annual energy costs and reduces greenhouse gas/CO2 emissions due to no terminal fan use for distribution of air.
- > Newer technology allows for the variation of the nozzles airflow to accommodate demand control ventilation while not losing induction ratios.

**IMAGE:**  
**Four Pipe Fan Coil System with DOAS (Left)**  
**Variable Refrigerant Flow (VRF) with DOAS (Right)**

**Disadvantages:**

- > Temperature swings can be hard for the chilled beam to keep up with that can cause comfortability issues for some in the extreme hot or cold.
- > Pumps, Heat Pumps and/or chillers will require periodic maintenance.

**Four Pipe Fan Coil System with DOAS**

Four-pipe systems utilize two independent coils, one for heating and one for cooling, modulating cooling and heating valves for controlling coil capacities allow this type of system to only deliver the quantity of heating or cooling required by the space load. This makes the system very comfortable. For example, if 62F air is required to condition the space, then the coil valves will modulate water flow to the coils to deliver air at this temperature.

This system requires a central chiller and a boiler to provide the heating and cooling water to each respective loop. The water is circulated to the fan coils located in various mechanical rooms within the facility or could come from the campus network.

The estimated first cost for this system is around \$45/SF installed.

**Advantages:**

- > Unoccupied areas of the building may be isolated and shut down.
- > Zones can be individually controlled.
- > Familiar system across campus.

**Disadvantages:**

- > This system requires multiple building envelope penetrations to accommodate individual outside air and relief hoods/louvers.
- > Water loops need to be chemically treated periodically to prevent corrosion.
- > Failure of the many valves and components it is circulated through.

**Variable Refrigerant Flow (VRF) with DOAS**

Variable refrigerant flow systems with heat recovery (VRF-HR) capability can operate simultaneously in heating and/or cooling mode, enabling heat to be used rather than rejected as it would be in traditional heat pump systems. VRF-HR systems are equipped with enhanced features like inverter drives, pulse modulating electronic expansion valves and distributed controls that allow the system to operate in net heating or net cooling mode, as demanded by the space.

The system we would propose would use a combination of concealed ducted ceiling mounted units to condition smaller

individual spaces. Fan coil style units would also be used in larger meeting and conference rooms to provide adequate zoning. Additional refrigeration piping and capacity will be added based on anticipated needs by the owner. The outdoor condensing units will be mounted on the ground near the building since we will likely have a pitched roof. If mounting the unit on the roof is unacceptable, a well space at roof level or a ventilated mechanical space at the perimeter of the building are also acceptable locations for the units. Efforts will be made to locate the units in a central location considering the refrigeration line length limitation of the systems.

The estimated first cost for this system is around \$42/SF installed.

**Advantages:**

- > It's very flexible. The system can be subdivided or expanded into new zones to fit building remodeling or additions easily and inexpensively when extra branches are provided and capped.
- > If a unit fails, the entire system doesn't shut down.
- > This type of system can easily be designed to facilitate partial occupancy of the building while the remaining portions are unoccupied.
- > Its high efficiency reduces annual energy costs and reduces greenhouse gas/CO2 emissions.

**TABLE:**  
**Analysis of Mechanical Systems**

Disadvantages:

- > Refrigerant leaks can be troublesome to track down when they occur.
- > The sound of outdoor condensing units can be loud.
- > Control integrations between proprietary controls and DDC can be problematic for precise control.

## D.7 PLUMBING BASIS OF DESIGN NARRATIVE

Domestic hot water will be generated from water-to-water heat exchangers connected to the new low temperature heating water system, serviced by the newly proposed geothermal heating water system. Domestic hot water will be generated between 115-120°F from a water to water heat exchanger located in the mechanical room of phase 1. If water temperatures in excess of 120°F are needed within the building, an electric booster heater should be provided (style of booster heater to be determined based upon discussions with EWU). Point of use mixing valves will be used at all lavatories and hand washing sinks to limit water to 105°F. Each system will have a circulation pump, which will operate only in the building occupied hours, or as programmed by the Energy Management System.

Plumbing fixtures, water heaters, domestic water piping, sanitary waste and vent piping, and storm drainage (rainwater) piping will be designed and installed in accordance with the Uniform Plumbing Code, Washington State Amendments to UBC Chapter 11 Accessibility and the Rules and Regulations of the Washington State Board of Health.

Site Utilities for sewer and water service will come from existing sanitary sewer lines that run along the northern and eastern portion of the site as well as a water line along the eastern portion, which will be used as the connection point for the proposed building. It is assumed the building will have fire sprinklers and will need a fire service line

| SYSTEM                                | COST ESTIMATE:  | PRO   | CONS   |
|---------------------------------------|---|---|--|
|                                       | <ul style="list-style-type: none"> <li>- FIRST COST</li> <li>- ANNUAL MAINTENANCE COST</li> <li>- ANNUAL ENERGY COST</li> </ul> |   |  |
| Chilled Beams (Preferred Alternative) | \$1,200,000<br><br>\$4,464<br><br>\$41,240  | <ul style="list-style-type: none"> <li>• Lowest energy system</li> <li>• Possible Integration of Campus Utilities</li> <li>• Very Little Maintenance for Terminal Units</li> <li>• Individual Room Control</li> </ul> | <ul style="list-style-type: none"> <li>• High First Cost</li> <li>• Relies on Geothermal Central Plant for Maximizing Efficiency</li> </ul>  |
| 4-Pipe Fan Coil                       | \$1,080,000<br><br>\$6,460<br><br>\$54,200  | <ul style="list-style-type: none"> <li>• Possible Integration of Campus Utilities</li> <li>• Ease of Controllability</li> <li>• Familiar System on EWU Campus</li> </ul>  | <ul style="list-style-type: none"> <li>• No Individual Room Control for Smaller Spaces</li> <li>• Not as Efficient as Other Systems</li> <li>• Chiller/Boiler Maintenance</li> </ul>   |
| Variable Refrigerant Flow             | \$1,008,000<br><br>\$3,752<br><br>\$40,385  | <ul style="list-style-type: none"> <li>• Lowest First Cost</li> <li>• Energy Efficient</li> <li>• Flexible Installation</li> <li>• Individual Room Control</li> </ul>   | <ul style="list-style-type: none"> <li>• No use of Campus Utilities</li> <li>• Lots of refrigerant piping and leak potential</li> <li>• Shorter Equipment Lifespan</li> <li>• Specialized Technician Required for Maintenance</li> </ul> |

as well as the domestic water service line. An irrigation system will be connected to the same water line. Locations for backflow preventers, water meters and fire hydrants will be determined during building and site design.

It is estimated that the new facility will require a 2-1/2 inch domestic water service and a 6-inch wastewater connection. Survey information will determine if a new tap is required for either service mentioned.

Kitchen faucets will be limited to 2.2 gallons per minute (gpm) flow except for those used for filling operation. Toilet rooms will have wall hung water closets (1.28 gallons per flush) and urinals (0.125 gallon per flush) with battery-powered, sensor-operated flush valves. Lavatories will be low flow (.5 gpm), battery-powered, sensor-operated faucets.

LEED requirements may affect the values stated above if points for Indoor Water Use Reduction are implemented.

## CONCLUSION

In conclusion, we believe the active chilled beam system will be the best system fit for the proposed building and use. Blending high efficiency and versatility while respectfully using the land as a heat sync provides one of the lowest carbon footprints available and will assist in LEED certification of the new facility. While this system is not the least expensive upfront cost option it will attain project goals of sustainability and renewability which are extremely important to the meaning and mission of the Lucy Covington Building stakeholders. This system also gives excellent zone control and equipment longevity which is easily modified for future building reconfiguration in the future. The table below is a summary of estimated costing and benefit analysis.

## D.8 ELECTRICAL, TELE-COMMUNICATIONS, AND SECURITY BASIS OF DESIGN NARRATIVE

### PROJECT ELECTRICAL ANALYSIS

#### General

The conceptual program for the Preferred Alternative allocates approximately 15,000 gross square feet (GSF), into a single-story facility that supports the project goals described in Section 02, Problem Statement. The proposed Lucy Covington Leadership House brings together cultural/community gathering & event spaces, student collaboration & support spaces, and exhibit gallery & performance spaces. The proposed building concept incorporates a speaking hall that accommodates 300 people, a student commons for studying and collaboration, and exhibit space featuring the life and legacy of Lucy Covington.

Located on the southeast corner of 7th Street. And G Street, in the City of Spokane, Washington. The project includes minimal additional parking in accordance with City of Spokane ordinances and provisions, given there is existing parking in proximity. The new building will adhere to the 2021-23 OFM Biennium Pre-design Manual & the 2020 NEC (National Electrical Code). Design will provide power and infrastructure for solar readiness to allotted space designated by architect to comply with 2021 Washington State Energy Code.

#### Applicable Codes And Standards

The completed installation will conform to the latest adopted version of all federal, state, and local codes with amendments and additions, regulations, including industry standards, such as:

- > IEEE: Institute of Electrical and Electronic Engineers
- > NEMA: National Electrical Manufacturers Association
- > NFPA: 110

- > NFPA: National Fire Protection Association
- > NEC: National Electrical Code
- > IBC: International Building Code
- > IFC: International Fire Code
- > TIA/ETA: All Applicable Telecommunications Industry Assoc./ Electrical Industries Alliance. Applicable State and local codes, laws, and ordinances.

All Necessary permits and inspection required by the governing authorities having jurisdiction over this work are to be obtained by the Contractor. Compliance with state and local codes is the responsibility of the Contractor.

#### Existing Site Utilities

Existing onsite power. The proposed project site is currently serviced by Avista through underground electrical distribution system. The campus Electrical Distribution Upgrades Ph. 2, Termination Pt. #11A above grade, brings a high voltage switch to the proposed Lucy Covington Leadership House site. A new underground feeder from the existing termination Pt. #11A will be installed to serve the new building. Transformer location to be coordinated during design phase

Utility to coordinate burial of remaining electrical overhead services and/or relocation of underground electrical. Avista and Eastern Washington Campus Officials to verify acceptable design.

#### New Electrical Power Distribution

The proposed project site is currently serviced by underground electrical and would require use of the above ground service and meter locations to be coordinated with Architect. Estimated utility service will be 2000 AMPS at 208V, 3 PHASE, with estimated loads as follows:

- > Lighting 18.7 Kw
- > Air Conditioning 100 Kw
- > Heating 28.3 Kw
- > Water Heating 15.4 Kw

- > Cooking 13.7 Kw
  - > Refrigeration 3.66 Kw
  - > Receptacles 137.3 Kw
  - > Miscellaneous 4.6 Kw
  - > Elevators 20 Kw
  - > Other Motors 92.7 Kw
- Total Connected Load 434.4 Kw  
+25% Spare Capacity 543 Kw

543 kW at 80% Power Factor 679kVA  
(1885 amps)

#### Power Density

Standard power density (W/ft<sup>2</sup>) for typical educational space will be provided.

#### Redundancy And Emergency Power

A generator will be provided for the addition as an alternate electrical source of power for use during an interruption of the normal electric supply if the existing emergency generator systems prove to be loaded to the recommended maximum capacity. Generator back-up and emergency power will be provided in accordance with the NEC, and NEMA 110.

Eastern Washington University Campus requirement specify emergency and standby power generation will be provided by means of a weatherproof sound attenuating engine driven natural gas fueled generator set. The generator will be sized to supply the emergency and standby loads served. Emergency power will be monitored to report most normal failures such as low starting batteries, overload, etc.

The generator(s) will be mounted at appropriate height to allow for maintenance access to oil drain low point. Provided with an automatic transfer switch to automatically switch loads between the normal EWU campus power and generator backed power.

The emergency electrical distribution system will supply power to all life safety systems within the building such as egress lighting, exit lighting and the fire alarm system. Standby power system

is to provide generator backed power to non-life safety loads within the new building as necessary, such as computer servers, telecommunications rooms and its associated cooling along with any other equipment determined critical.

### Lighting Design

Lighting controls will be in accordance with applicable energy codes. Lighting levels will be provided in designated spaces per 2021 Washington State Energy Code. We will use the Illuminating Engineering Society (IES) standards for all areas not covered by the Architect/Engineer Design Guide. High efficiency LED luminaires will be provided with energy-saving control and switching scenarios. Light fixture types, layout and switching configurations/locations, utilizing antimicrobial finishes where required will be closely coordinated in accordance with EWU standards and design intent. In addition, site/parking LED lighting standards will also be added and integrated into the existing campus site-controlled lighting infrastructure. Lighting CCT will range from 3500 K - 4000 K promoting focus and alertness in an education facility. Interior Lighting Power Allowances – Building Area Method will meet the 0.70 LPD (w/ ft<sup>2</sup>) per WAC 51-11C-405053. Exterior building grounds lighting will have an efficacy of 100 lumens per watt per WAC 51-11C-4705061.

### Lighting Levels

Lucy Covington Leadership house required lighting levels are as follows: (For spaces not listed, the current IESNA light level recommendations will be followed).

- > Offices: 45 FC with dual level switching and occupancy sensor.
- > Lobbies: 20 FC
- > Corridors and means of egress: 15 FC.
- > Conference rooms: 30 FC to 50 FC with dimming controls as required.
- > Restrooms: 20 FC
- > Equipment rooms: 30 FC

- > Computer Rooms/Data Center: 50FC with dual level switching.
- > Laboratories (general): 750 to 100FC.
- > Exterior lighting at building entrances, walkways, streets, and parking lots: Not more than 2 FC.

Enhanced Circadian Lighting Design that promotes higher productivity, improved memory and cognitive function including improved mood and metabolic health will be considered to combat the systemic relationship that Indigenous students have with education facilities.

### Lighting Controls

Manual switches to turn on, occupancy sensors to turn on or off, scheduled lighting controls and lighting sweeps and daylight dimming will be designed in accordance with applicable state and federal energy codes in addition to meet and/or exceed project LEED Silver certification requirement. Predesign lighting control intent is as follows:

- > Open office: manual switch on, occupancy sensor off.
- > Closed office, storage and copy rooms: manual switch on, occupancy sensor off.
- > Corridors and other service spaces: time clock schedule.
- > Perimeter office (open and closed), lobbies and corridors: same as above, but also include daylight dimming.
- > Conference rooms: manual switch on, occupancy sensor off.
- > Parking garage: Not Applicable.
- > Exterior: photocell and time clock.

### Receptacles

Receptacles will be duplex-grounded receptacles and no more than 6 duplex receptacles on a single circuit. Electrical receptacle cover plates will be distinctively colored or marked for identification.

Electrical receptacle cover plates or electrical supplied from the emergency system will be distinctively colored or marked for identification. Ground fault

interrupters will comply with NFPA 70. Receptacles will comply with the Architect/Engineer Design Guide.

### Conduit

Conduits will be rigid metal type when used in damp or exposed locations, or when specifically required by the NEC. PVC conduit will be used where routed underground. PVC Schedule 40 conduit will be used for concrete encased circuits. PVC Schedule 80 conduits will be used for direct buried branch circuits. Electrical metallic tubing will be used in dry concealed locations and in furred, ceiling spaces. Flexible conduits will be used for final connections to be recessed luminaires, motor driven equipment and vibrating equipment. Conduit will not be used as a ground path; all electrical circuits will contain an equipment ground wire. Minimum conduit size will be ¾" trade size for homeruns, ½" to receptacles, switches, and luminaires.

### Conductors

Conductors will be copper with 600-volt insulation. Conductors No. 8 and larger will be stranded, type THWN. Smaller conductors will be a solid type THHN/THWN. Aluminum conductors will not be permitted. Conductors for use in high temperature locations will be insulated as required by the NEC. The minimum size of power conductors will be No. 12 AWG.

### Fire Alarm System

The Fire Alarm System will be provided in compliance with NFPA 101 and NFPA 72 as well as the Architect/Engineer Design Guide. The system will be integrated into the existing campus facilities fire alarm system. Contractor will provide a complete fire alarm system design to meet all requirements of the AHJ (Authority Having Jurisdiction).

No specific type or manufacturer is required during predesign, EWU campus preferred manufacturer and type will be coordinated during design phase. A fully addressable system is required to be code compliant.

### Security System

Coordination with Owner's preferred vendor for rough-in and raceway only to device locations to be fully integrated per EWU standards.

### Data And Communication Systems

The data and communications system scope of work at this time includes horizontal cabling for condominium units (phone and CATV), backbone cabling to each office level and each of two major retail tenant spaces, and house cabling needs. This includes copper, cable TV and fiber optic for backbone, and copper UTP and CATV for horizontal cabling. Lucy Covington Leadership House data and cabling will be designed with Phase 2 taken into consideration.

Networking equipment such as servers, ethernet switches, routers, software, and computers will be owner provided.

Telecommunication Rooms: MDF room will be a dedicated space located on the first floor of the building, to be designed for the termination of horizontal station cabling, backbone cabling and campus distribution cabling.

### Security And Access Control

Coordination with Owner's preferred vendor for rough-in and raceway only to device locations. Security concerns for the building include controlling access to the office during the day to meet campus expectations and after hours. No specific type or manufacturer is being specified during predesign. Desired security system features (e.g., card reader, fingerprint, length of image storage capacity, remote access capabilities and backup features, user programmability, reporting functions, battery backup duration, etc.) will be coordinated with EWU campus security.

### Audio Visual Systems

To be room specific, coordination with Owner's preferred vendor for rough-in and raceway only to device locations. Distribution of audio and video signaling within each classroom and conference room in accordance with EWU standards.

The system will consist of AV input plate(s), ceiling mounted speakers, amplifier/video switcher, control panel, mounting hardware, wireless microphones, assistive listening output, and cabling. Audio visual equipment, such as video projectors, flat panel displays, etc. and will be furnished by the owner.

## SUSTAINABILITY

### General

Project baseline goal is LEED Silver with mandated Energy and Atmosphere requirements as follows:

- > Fundamental Commissioning and Verification
- > Minimum Energy Performance
- > Building-Level Energy Metering
- > Fundamental Refrigerant Management

Stretch goal for project entailing LEED Platinum to be addressed during design phase. EWU has expressed strong interest in Net Zero Renewable Energy. Enhanced goals to achieve Net Zero to be further assessed during design phase taking into account cost effectiveness, space constraints and environmental impact. Cost effective is defined as a simple payback of less than 5 years or a life cycle cost less than the baseline. A life cycle cost analysis (first cost, energy, operations, maintenance, replacement, productivity), is not necessary for measures with simple paybacks less than 5 years.

### Solar Design

On-site renewable energy. New buildings larger than 10,000 square feet of gross conditioned floor area, will include a renewable energy generation system consisting of not less than 0.5 W/ft<sup>2</sup> or 1.7 Btu/ft<sup>2</sup> multiplied by the sum of the gross conditioned floor area. Washington State Energy Code 2021 Edition, 51-11C WAC Section C411.

Based on a 15,000 SF footprint the solar design will need to generate 7-8kW of renewable energy. It can be anticipated

to be a minimum of \$93,000.00 Solar Energy Electrical Power Generation System including, solar panels, inverter(s), mounting, accessories.

### System Specifications:

- > MAXIMUM POWER DC (WP): 8,000 watts DC; 8.0 kW
- > MAXIMUM POWER AC (WP): 7,305 watts AC CEC
- > ESTIMATED POWER GENERATED: 967 kWh AC monthly average
- > MAXIMUM POWER VOLTAGE VMP (V): 240 Volts
- > MAXIMUM SYSTEM OUTPUT CURRENT IMP (A): 29 Amps
- > MINIMUM REQUIRED OCPD CIRCUIT BREAKER RATING (A): 40 Amps
- > ARRAY DIMENSIONS: 430 square feet
- > ARRAY WEIGHT: 1,120 lbs.
- > DISTRIBUTED LOAD: 2.6 lbs. psf.

### Sustainability Goals And Strategies Summary

Eastern Washington University commitment to sustainability (EWU Climate Action Plan) and decarbonization offers several opportunities for LCLH to integrate enhanced energy efficiency design directives to include but not limited enhanced lighting control, color rendering, established equipment benchmark (e.g., plug load v. total energy consumption), controlled receptacles, light pollution reduction and renewable onsite energy.

Challenges towards building wide sustainability include space constraints limiting onsite renewable photovoltaic energy production. Photovoltaic battery storage and efficacy losses also pose a concern for a net zero design. Photovoltaic battery storage needs, an approximate lifespan of 20 years and cost effectiveness concerns pose ongoing challenges and future concerns. Electrical Utility power grid requirements will not reduce total Avista power plant capacity design and needs for the building.

## COMMISSIONING

### Scope

Current commissioning scope with campus management includes lighting controls, fire alarm interface, emergency power.

Electrical equipment (switchboards, panel boards, transformers), vertical transport, special systems (security, data and communications, intercom, CCTV, fire, life safety, fire alarm) are not under commissioning authority but will still have quality control and assurance requirements performed by design team, campus operations staff and the contractor.

### Commissioning Plan

An Ongoing Commissioning Plan is a required document for LEED, Fundamental Commissioning of the Building Energy and Atmosphere Systems.

### Rigor

Project predesign commissioning scope is for above average rigor of building systems.

### Design Reviews

Design Reviews are characterized by a thorough independent design review of the commissioned systems and assemblies by qualified engineers focusing on commissioning, performance, and O&M issues.

### Specifications

Commissioning specifications will be thorough and fully describe all requirements of the Contractor, including specific testing requirements for each type of equipment.

### Roles

The roles of all parties and the sequence of the commissioning process will be clearly and completely described.

### Installation Verification

Installation Verification during early and mid-construction the level of rigor is characterized by field observation by the Commissioning Authority or team, as necessary, to observe component and system installations for general progress and issues affecting performance and testing. Contractors are responsible for the installation, set up and startup of their equipment and filling out Commissioning Authority provided, and all manufacturer provided checklists.

### Performance Verification

Performance Verification/Testing will be accomplished through review of control code programming, documented field testing of each sequence of operation for all equipment and through monitoring performance over time with trend logs from the building automation system. Testing will be conducted from detailed, step-by-step, repeatable test scripts specifically applicable to this project approved by the Commissioning Authority. Testing will include testing each sequence in the sequence of operations, and other significant modes, sequences and control strategies not mentioned in the written sequences; including, but not limited to startup, shutdown, unoccupied and manual modes, modulation up and down the unit's range of capacity, power failure, alarms, component staging and backup upon failure, interlocks with other equipment, and sensor and actuator calibrations.

All larger, more complex, or life-safety equipment will be individually tested. Testing only a sample of some equipment may be allowed where such equipment is small in physical size or importance, is numerous and is not complex or critical for life-safety. Tests for a given system or assembly will not be conducted until they are fully operational under normal and reliable control with construction checklists, control calibrations, programming and control system graphics complete.

All testing documentation for complex equipment will be directed and overseen by the Commissioning Authority or by another independent party, such as the fire marshal or a certified independent testing company (e.g., electrical equipment testing). Documented testing for less complex equipment and repetitive equipment (of large quantities, e.g., air terminal units) may be directed by the Contractor alone, as approved by the Commissioning Authority, with spot retests and test report review by the Commissioning Authority.

### Commissioning Objectivity

Project predesign commissioning scope is for typical level of objectivity. Commissioning Authority will have direct access to independently discuss issues with any party of the project team and by all issues identified by the commissioning team from initial identification being concurrently distributed directly to the Owner, Architect and Contractor.

### Issue Management

Issue Management. Issues are legitimate for identification and distribution when, 1) Any requirements as delineated in the contract documents are not being met, or 2) When significant elements of the EWU's Project Requirements are not being met). Issues will be reported regardless of potential cost impacts to any party or potential impacts to the project schedule.

## SECTION 06

## APPENDIX E: MEMORANDA OF UNDERSTANDING

## E. MEMORANDA OF UNDERSTANDING

The Lucy Covington Leadership House will further the goals of Eastern Washington University's commitment to the Memoranda of Understanding (MOUs) with three regional Tribes: Coeur d'Alene (July 26, 2019), Kalispel (February 12, 2018), and Spokane (April 15, 2019).

The primary purpose of the MOUs is to sustain and advance relationships between EWU and these Tribes. The purpose identified in the MOUs are summarized as follows:

- > Establish an Annual Tribal Leadership Summit.
- > Establish an American Indian Advisory Board where each Tribe has the authority to appoint one individual.
- > Recruit, retain, and successfully graduate more American Indian students.
- > Recruit, retain, and promote qualified American Indian faculty and staff to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
- > Strengthen partnerships between tribal communities and EWU academic and student support areas.
- > Plan and construct a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's Tribes, and serves as a place for cultural learning and exchange for the entire community.

Through the MOUs, the preceding priorities will receive sustained attention from EWU and the Tribes to maintain communication and address shared objectives.

The MOUs are guided in spirit by the Centennial Accord between the Federally Recognized Indian Tribes in Washington State and the State of Washington of 1989. The accord affirms the sovereignty of Washington's federally recognized tribes and calls for clearer communication and better collaboration between tribal and state governments.

#### **Lucy Covington Center Repository Research Agreement**

Through an ongoing partnership with the Colville Confederated Tribes that Eastern Washington University formalized in the 'Lucy Covington Center Repository Research Agreement,' EWU intends to honor Lucy Covington's legacy. Within the Lucy Covington Initiative, emphasis areas have been identified: supporting future leaders; creating a confluence of culture and causes; and developing a Lucy Covington Archive.

The MOUs are included in this Appendix. A full copy of the Lucy Covington Center Repository Agreement (14 pages) is also available upon request.

**Re: Memorandum of Understanding Between the Spokane Tribe of Indians and Eastern Washington University**

Dear Ms. Jones,

Enclosed please find two original copies of the Memorandum of Understanding Between the Spokane Tribe of Indians and Eastern Washington University (“MOU”) and the Spokane Tribe of Indians regarding, among other things, establishing an Annual Tribal Leadership Summit and a Native American Advisory Board.

The Spokane Tribal Business Council (“Tribal Council”) has approved the MOU and Chairwoman Carol Evans has signed on behalf of the Tribe. Please countersign both original copies, keep one original for your records, and return the other to the Tribe via the enclosed self-addressed return envelope. The Tribe looks forward to working with EWU to strengthen the relationship and enhance EWU’s educational research and service partnerships and programs.

Respectfully,

A handwritten signature in black ink, appearing to read 'Jessica Flett', with a long, sweeping flourish extending to the right.

Jessica Flett  
Legal Counsel

## Memorandum of Understanding Between The Spokane Tribe of Indians and Eastern Washington University

This Memorandum of Understanding (“MOU”) is entered into by Eastern Washington University (“EWU”) and the Spokane Tribe and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.’

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Spokane Tribe of Indians and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Spokane Tribe.

EWU and the Spokane Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU’s educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

### 1. Purpose.

- 1.1 Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Spokane Tribe:
  - 1.1.1 Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.
  - 1.1.2 Establishing a Native American Advisory Board (“Advisory Board”) composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.
  - 1.1.3 The Tribal Business Council of the Spokane Tribe of Indians shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.
  - 1.1.4 Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.
  - 1.1.5 Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
  - 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.

- 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
  - 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Spokane Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided by the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).
- 3. Implementation of MOU**
- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.
  - 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
  - 3.3 This MOU may be amended by mutual written agreement of the parties at any time.

3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

**MEMORANDUM OF UNDERSTANDING**  
**BETWEEN**  
**THE COEUR D'ALENE TRIBE AND EASTERN WASHINGTON**  
**UNIVERSITY**

This Memorandum of Understanding ("MOU") is made between Coeur d'Alene Tribe ("the Tribe"), P.O. Box 408, Plummer, Idaho 83851, and the Eastern Washington University ("EWU"), 214 Showalter Hall, Cheney WA 99004, and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Tribe and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Tribe.

EWU and the Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU's educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

**1. Purpose.**

**1.1** Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Coeur d'Alene Tribe:

**1.1.1** Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.

**1.1.2** Establishing a Native American Advisory Board ("Advisory Board") composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.

**1.1.3** The Tribal Council of the Coeur d'Alene Tribe shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.

**1.1.4** Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.

- 1.1.5 Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.
  - 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.
  - 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
  - 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Coeur d'Alene Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws. Nothing in this MOU shall be construed as a waiver of the Tribe's inherent sovereign immunity.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided in the spirit of the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in

Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).

**3. Implementation of MOU**

- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.
- 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
- 3.3 This MOU may be amended by mutual written agreement of the parties at any time.
- 3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

## Memorandum of Understanding Between The Kalispel Tribe of Indians and Eastern Washington University

This Memorandum of Understanding (“MOU”) is entered into by Eastern Washington University (“EWU”) and the Kalispel Tribe and signed below, with reference to the following:

EWU recognizes and affirms established Federal policies under which Native American tribal governments are treated as distinct legal and political entities, with their own powers of self-government and self-determination.’

This MOU is being enacted for the purpose of enhancing and sustaining the government-to-government relationship between the Kalispel Tribe of Indians and EWU, a state agency, within the protocol outlined in the Washington State Centennial Accord and the Kalispel Tribe.

EWU and the Kalispel Tribe wish to formalize and sustain a structure that strengthens and advances the relationships between them and enhances EWU’s educational research and service partnerships and programs involving tribes, American Indian students, and the broader American Indian community.

### **1. Purpose.**

- 1.1** Based on this MOU, the following will occur to sustain and advance relationships between EWU and the Kalispel Tribe:
  - 1.1.1** Establishing an Annual Tribal Leadership Summit. At this government-to-government meeting attended by elected tribal leaders and the EWU president, priority initiatives will be identified, discussed, and advanced.
  - 1.1.2** Establishing a Native American Advisory Board (“Advisory Board”) composed of tribal representatives, the EWU Vice President for Diversity and Inclusion, as well as appropriate EWU students, alumni, staff, and faculty. This group will address priorities and issues identified at the EWU Tribal Leadership Summit.
  - 1.1.3** The Tribal Business Council of the Kalispel Tribe of Indians shall have the authority to appoint one (1) individual of their choosing to serve on the Advisory Board.
  - 1.1.4** Enhancing efforts, particularly through early outreach to middle schools and high schools, to recruit, retain and successfully graduate more American Indian students with university degrees.
  - 1.1.5** Recruiting, retaining, and promoting qualified American Indian faculty and staff at the University in academic and administrative departments to aid EWU in its mission and delivery of services to tribal communities and American Indian students.

2/1/18

- 1.1.6 Strengthening partnership between tribal communities and EWU academic and student support areas.
  - 1.1.7 Planning and constructing a longhouse-style facility on campus that enhances the recruitment and success of American Indian students, acknowledges and honors the region's tribes, and serves as a place for cultural learning and exchange for the entire community.
  - 1.2 Through this MOU, the preceding priorities will receive sustained attention from EWU and the Kalispel Tribe to maintain communication and address shared objectives.
  - 1.3 This MOU will institutionalize, formalize and sustain these important relationships, ensuring that changes in leadership will not diminish the university's commitment to working with the tribe or the tribe's commitment to working with the university.
- 2. Terms and Working Principles**
- 2.1 The parties entering into this Memorandum of Understanding agree to the following terms and working principles detailed in this section below, which will aid in creating mutual understanding and productive relationships.
  - 2.2 **Unique Legal Status of the Tribe:** The unique legal status of tribes, rights reserved through treaties, agreements, historic and cultural interests, creates a unique relationship between tribes and state agencies, including EWU. Tribes maintain sovereign rights that predate the formation of the United States and the State of Washington and are guaranteed under treaties and federal laws.
  - 2.3 **Government-to-Government:** Federally Recognized Indian Tribes have a special government-to-government relationship with the United States government. Government-to-government is also used to describe the relationship and protocols between tribes and other governments such as states. State agencies and tribes work directly with each other in a government-to-government fashion, rather than as subdivisions of other governments.
  - 2.4 **1989 Centennial Accord:** This Memorandum of Understanding is guided in the spirit of the *Centennial Accord Between the Federally Recognized Indian Tribes in Washington State and the State of Washington* of 1989. The Centennial Accord is published on the internet by the Governor's Office of Indian Affairs at [www.goia.wa.gov/Government-to-Government/CentennialAgreement.html](http://www.goia.wa.gov/Government-to-Government/CentennialAgreement.html). A corresponding accord between the out-of-state tribes with treaty reserved rights in Washington State can be found at [www.goia.wa.gov/Relations/OutOfStateAccord.pdf](http://www.goia.wa.gov/Relations/OutOfStateAccord.pdf).
- 3. Implementation of MOU**
- 3.1 This Memorandum of Understanding will become effective upon the signatures of the parties.

2/1/18

- 3.2 The parties shall meet and review progress under this agreement on an annual basis, in the format outlined within this memorandum.
- 3.3 This MOU may be amended by mutual written agreement of the parties at any time.
- 3.4 Any party may withdraw from this MOU by providing the other parties 30 days' written notice of its intent to withdraw.

The following represents the architect's understanding of discussions held and decisions reached in the meeting. Anyone with amendments to these minutes should notify the author within five (5) days of the minutes date in order to amend as appropriate.

---

### ACTION ITEMS

> None

mahlum

| ITEM | DISCUSSION  | ACTION BY |
|------|---|-----------|
| 1.1  | Introductions   |           |
| 1.2  | <p>EWU Climate Action Plan &amp; Certification Paths:<br/>The team broadly reviewed EWU's 2022-2025 Climate Action Plan, following by discussion of different sustainability certification paths.</p> <p>LEED Certification</p> <ul style="list-style-type: none"> <li>&gt; Project will be required to meet LEED Silver level certification. Other campus projects were able to achieve Gold level certification, and that can be a target for Lucy Covington Leadership House project.</li> </ul> <p>International Living Future Certifications</p> <p>The team broadly reviewed different levels of ILFI Certification systems</p> <ul style="list-style-type: none"> <li>&gt; EWU noted CORE Green Building Certification may be worthwhile to consider if requirements appear to be in strong alignment with the project</li> <li>&gt; Further review is needed to better understand how this certification compares with LEED Gold level; to understand the level of effort and differences in certifications.</li> <li>&gt; Exploring a certification program alternative to LEED may be of interest to keep up with or surpass other rival universities that are pursuing alternative sustainability certifications.</li> </ul> |           |
| 1.3  | <p>Sustainability Considerations</p> <p>SITE</p> <p>The team discussed ways to reconnect and relate to the natural environment and the surrounding context through baseline and stretch goal lenses.</p> <ul style="list-style-type: none"> <li>&gt; Baseline: open space, bioretention swales and rain gardens, reduction of het island effect on the project site</li> <li>&gt; Creation of ethnobotanical garden- pilot credit. Medicinal garden has been identified as a desired component of the project.</li> <li>&gt; Stretch goals: permeable paving may be a consideration, but a green roof is not desired as it is not as successful considering the climate.</li> </ul> <p>WATER</p> <p>The team discussed ways to rethink how we use water, respect it as a natural resource, and work in harmony with natural water flows.</p> <ul style="list-style-type: none"> <li>&gt; Baseline use of low flow fixtures and ultra-low flow fixtures acceptable. Waterless urinals have been problematic in the past and should be avoided.</li> <li>&gt; Baseline heat pump water heating systems can be implemented along with hot water assist form water source heat pump units</li> </ul>  |           |

mahlum

combined with hot water recirculation to provide building domestic hot water. This will be explored and

- > Stretch goal: Rainwater harvesting, and grey water reuse requires complex systems and space that would be better used in upgraded efficiencies and energy use systems. These will not be pursued unless needed.
- > Stretch goal: Advanced water metering of systems to identify possible water saving strategies and solutions to implement was an option to explore.

## ENERGY

The team discussed ways to reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

- > Baseline will use high performance HVAC equipment in conjunction with Micro District Ground Source System in combination with decoupled high efficiency DOAS system which will achieve EUI of low 20's.
- > Passive cooling via operable windows is seen as problematic due to security and outdoor air conditions that present themselves in the area throughout the year. This would also be problematic with louvered openings and wind sails as well.
- > Passive style envelope to help energy usage systems perform at the highest level possible is encouraged.
- > Interface between water source heat pumps and domestic water systems to help drop energy usage across systems will help overall system efficiency.
- > Stretch goal: Enhanced commissioning can be used to ensure systems are being properly utilized to maximize efficiency. This was a possibility to investigate the project.
- > Possible credits for renewable energy power agreements that may already be used on campus. Research will be done to see if this is viable.
- > PV panels are desirable, but the team discussed the challenge of power storing to get the project towards net zero, due to both first cost and efficiency loss.

## CARBON

Team discussed ways to reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

- > Project would pursue CLT and sustainably sourced lumber to reduce project's embodied carbon impacts.
- > Low carbon concrete mix will be another way to reduce overall carbon footprint of the building.

mahlum

- > Team concluded that purchasing carbon offsets is not of interest due to lack of transparency and measurable outcomes.

#### HEALTH

The team discussed impacts and the relationship of the quality of materials, air and environment on human health.

- > Some baseline identified goals are design to Universal Design Principles, incorporating biophilia and access to daylight, but also specifying materials with Declare label.
- > Advanced filtration was also brought up using higher efficient filters on DOAS systems as well as the possibility of contaminant mitigation strategies such as ionization, electrostatic filters, UV light or HEPA filtration. This would be on a case-by-case basis and will be coordinated through design and implemented if desired.
- > Health can also be increased ventilation to spaces throughout the building while attaining credits. This was not commented on but will be investigated if desired.
- > Decreased acoustical reverberation can lead to a better overall environment and will be accounted for in design using duct lining, duct silencers, equipment selection and material systems chosen. This reduces the building "shock" factor when entering space.
- > Thermal comfort will be guaranteed through proper zoning and control of HVAC system such that each occupant will have optimized productivity and wellbeing. This was encouraged.

**END OF MEETING MINUTES**

# Lucy Covington Leadership House Project Update March 20, 2024

## Meeting Agenda

- Introductions (1 min)
- EWU Climate Action Plan & Certification Paths (9 min)
- Sustainability Goals & Strategies (60 min)
- Next Steps (5 min)

## Lucy Covington Leadership House EWU Climate Action Plan

### GREENHOUSE GAS REDUCTION STRATEGIES

BUILDING  
EFFICIENCY

TRANSITIONING  
CENTRAL PLANT  
TO RENEWABLE  
SOURCES

LAND  
RESTORATION

TRANSPORTATION  
"GREENIFICATION"

## Lucy Covington Leadership House Sustainability can look different

**SITE**

Reconnect and relate to the natural environment and the surrounding context.

**WATER**

Rethink how we use water, respect it as a natural resource, and work in harmony with natural water flows.

**ENERGY**

Reduce our reliance on carbon intensive energy by designing efficient, low-energy systems and relying on renewable forms of energy.

**HEALTH**

Human health and potential is strongly impacted by the relationship to and quality of materials, air and environment.

**CARBON**

Carbon emissions into the atmosphere are a primary driver of global warming and climate change.

# ILFI Certification systems

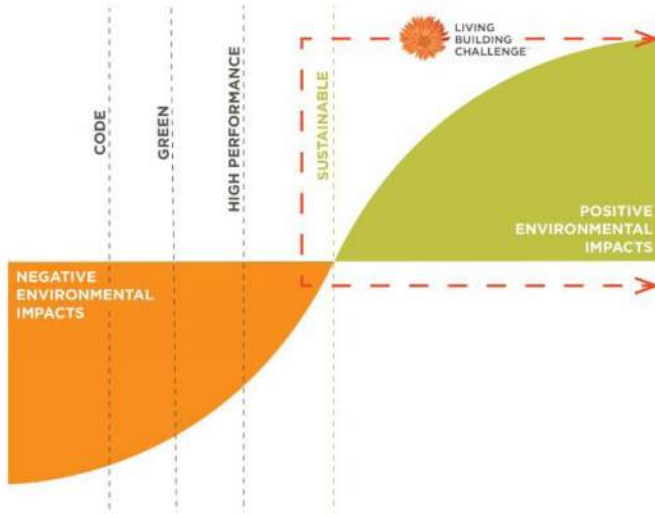

**CERTIFICATIONS**  
Stepping up to a Living Future

# ILFI Certification systems

## SETTING THE IDEAL AS THE INDICATOR OF SUCCESS

THE LIVING BUILDING CHALLENGE IS A PHILOSOPHY, CERTIFICATION, AND ADVOCACY TOOL FOR PROJECTS TO MOVE BEYOND MERELY BEING LESS BAD AND TO BECOME TRULY REGENERATIVE.

INSTEAD OF A WORLD THAT IS MERELY A LESS BAD VERSION OF THE ONE WE CURRENTLY HAVE- WE ASK A SIMPLE AND PROFOUND QUESTION- WHAT DOES GOOD LOOK LIKE?

12 | Living Building Challenge™ 4.0

| Site   |  |                                |  | OPPORTUNITIES  |  |   |
|--|--|--------------------------------|--|--|--|---|
| <p><b>Open Space</b><br/>LEED Credit can be obtained by providing 30% or more of open space for the entire site.</p> | <p><b>Bioretention Swales / Rain Gardens</b><br/>These areas to utilize native plants, provide water quality treatment and flow control.</p> | <p><b>Permeable Paving</b></p> |  | <p>Plenty of open space to utilize green space.</p>    | <p>Reduce heat island with green roof, permeable paving and shade trees.</p> | <p>Opportunity to restore the open space area with native and adapted plants.</p> |
| <p><b>Large Shade Trees</b><br/>LEED Heat Island Reduction Credit to shade paved areas</p>                           | <p><b>Ethnobotanical Garden</b><br/>Focus on local tribe's native edible plants and their other cultural uses.</p>                           | <p><b>Green Roof</b></p>       |  | <p>Utilize all stormwater runoff for rain gardens.</p> | <p>Reduce amount of water used or impervious.</p>                            | <p>Land restoration &amp; site preservation.</p>                                  |

|  |  |                                |  |  |  |   |

## Water

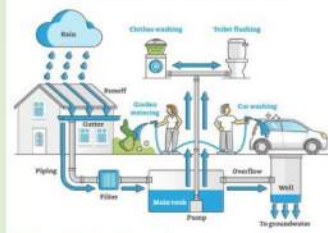

**Efficient Plumbing Fixtures**  
Reduce water demand by selecting low-flow or ultra low flow fixtures

**Efficient Hot Water Heating & Recirculation**  
Reduce hot water consumption by installing high efficient water heaters and circulation pumps

### RAINWATER HARVESTING

**RAINWATER HARVESTING**  
Display rain water catchment systems for educational purposes

**Drought Tolerant / Native Plantings**  
Select plants that will thrive in the PNW climate all year long

**Cherry Climate Graph - Washington Climate Chart**

**Advance Water Metering**  
Identify opportunities for improvement through fixture metering

**Greywater**  
Used water from sinks, showers, etc. without harsh chemicals

### OPPORTUNITIES

|   |  |  |
|---|--|--|
| Rainfall during school year to offset supply fixtures - toilet flush              | Capture HVAC condensate water for plants - reduce water  | Provide energy dashboard to display building performance |
| Conservation as encouragement to see world as more interconnected, interdependent | Identify passive savings paths through smart water for irrigation, pumping, hours & business for use | Water Independence                                       |
|   |  |  |
|   |  |  |

### CHALLENGES

|   |  |   |
|---|--|---|
| Up front costs and maintenance for water reuse  | Storm water capture is not efficient for irrigation in PNW (drought during time of need) | Storage room required for grey water system |
| Offering cost for rainwater collection installation versus budget in lower rain environment | Increased piping throughout building to accomplish rain to reuse water                   |   |
|   |  |   |
|   |  |   |

**BASELINE**
**STRETCH GOALS**
**DISCUSSION**

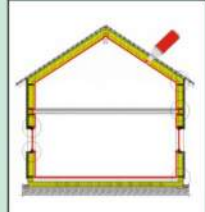

## Energy

**Luminaire Level Lighting Controls**  
Reduced power + student engagement

**Net Zero Energy (EUI 17-20)**  
The building produces as much or more energy than it uses. Maximize on-site solar PV & High performance HVAC system.

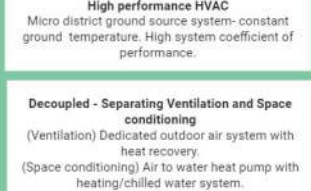

**Passive House Level Envelope**  
High levels of insulation and high-quality windows. Building airtightness, and minimized thermal bridging.

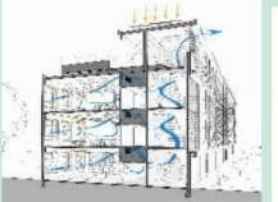

**Washington State Energy Code**  
Hi-performance envelope  
Reduced plug loads + plug load control  
Highly efficient HVAC systems with heat recovery  
Highly efficient LED lighting systems with automatic reduction controls

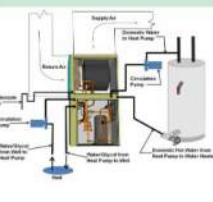

**High performance HVAC**  
Micro district ground source system-constant ground temperature. High system coefficient of performance.

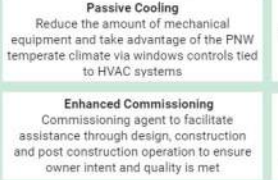

**Decoupled - Separating Ventilation and Space conditioning**  
(Ventilation) Dedicated outdoor air system with heat recovery.  
(Space conditioning) Air to water heat pump with heating/chilled water system.

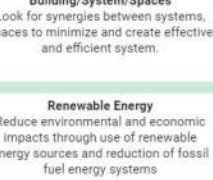

**Passive Cooling**  
Reduce the amount of mechanical equipment and take advantage of the PNW temperate climate via windows controls tied to HVAC systems

**Building/System/Spaces**  
Look for synergies between systems, spaces to minimize and create effective and efficient system.

**Enhanced Commissioning**  
Commissioning agent to facilitate assistance through design, construction and post construction operation to ensure owner intent and quality is met

**Renewable Energy**  
Reduce environmental and economic impacts through use of renewable energy sources and reduction of fossil fuel energy systems

### OPPORTUNITIES

|  |  |  |
|--|--|--|
| Generating systems that support learning for the EIU students and faculty        | Incorporate visible systems (PV, meter capacity, & usage) Educational/ Conservation  | Creating a building that gives back as much as it needs to be built and operate.           |
| Use hybrid systems to maximize energy use potential - water heat assist from WHP | Increased efficiency DOAS to reduce overall building load for cooling and heating    | Future proofing - good right envelope to resist future environmental change. Also leave... |
| Energy Independence  | Enhanced Lighting Control, Color Rendering, Glare Control, Circadian Lighting Design | Equipment Benchmarking: Plug loads + total energy consumption.                             |
| Controlled Receptacles: WSC requires 50%   | Lighting Design will meet LEED v.4 Material Ingredient Reporting                     | Light Pollution Reduction: Minimize consequences of development on wildlife.               |

### CHALLENGES

|   |   |   |
|---|---|---|
| Potential air quality issues for passive cooling / ventilation due to allergens and fire season air quality | Existing soil conditions for ground source + not fully known                                  | Creating balance between project costs and sustainability (high performance).                               |
| Spatial Daylight Autonomy: Possible challenges to building design   | Net Zero Solar: Grid-tie Constraints: Possible impact of manufacturing & Disasters of Panels. | Electrical Utility: Power Grid must still provide power to all loads (may not reduce power plant capacity). |
| PV Battery Storage System: Efficiency Losses  | PV Battery Storage: Access, Size, Lifespan  | Possible Limitation of 10% Solar Design Offset based on space constraints: Need for RSC's.                  |

| Code                 | Washington State Energy Code |      |           | Seattle Energy Code |      |           |

## Carbon

**Building Sector CO<sub>2</sub> Emissions**  
New Construction: 2015-2050

90% Building Materials  
10% Building Operations

**Carbon Offsets**  
purchase carbon offsets to zero out or reduce construction and building operation emissions.

**OPPORTUNITIES**

|  |  |  |
|  |  |  |
|  |  |  |

**Mass Timber**  
The use of CLT and heavy timber is advantageous for both the low carbon impact and biophilic design properties.

**Low Carbon Concrete**  
There are enough lower carbon mixes available now that amount to a 30% carbon reduction for little or no additional cost.

**Embodied Carbon - Lucy Covington Leadership House**  
Potential carbon reductions of 16-26% as compared to other construction types.

## Health

**Acoustical Performance**  
Promote occupant well-being, productivity and communications through acoustic design

**Local Materials**  
Within 500 miles or in WA State

**Certified Wood**  
50% FSC in structure, blocking, & finishes

**Major Causes of Sick Building Syndrome (SBS)**

**Maximize Indoor Air Quality**  
Provide strategies to eliminate SBS factors such as more efficient filtration, walk off mats, operable windows, CO2 monitoring and increased outside air ventilation

**Design for EQUITY**  
meet ADA requirements and Universal Design Principles

**Thermal Comfort**  
Promote occupant productivity and well-being through efficient thermal comfort design

**Specify Certified:**  
Red List Free, Living or Petal Certified products & materials (amount per LBC)

**Declare.**

**Specify responsible and transparent**  
Set targets and prefer products and manufacturers that:

- provide transparency (EPD, Declare, HPD, C2C)
- demonstrate equitable labor practices

**Circadian Lighting Design**

- Higher Productivity
- Improved memory & cognitive function
- Better metabolic health
- Improved Mood

**Just.**

**Prefer JUST**  
Just Diversity certified team members certified workforce / MWBE

**Access to daylight & fresh air for all regularly occupied spaces**

- Consider operable windows.
- Meet ASHRAE IAQ requirements

**Incorporate Biophilia**  
Connection with nature through natural forms, materials and replicating natural processes.

**CHALLENGES**
